

# **i.MX 6ULL Applications Processor Reference Manual**

Document Number: IMX6ULLRM  
Rev. 1, 11/2017

## Contents

Section number	Title	Page
<b>Chapter 1 Introduction</b>		
1.1	About This Document.....	159
1.1.1	Audience.....	159
1.1.2	Organization.....	159
1.1.3	Suggested Reading.....	160
1.1.3.1	General Information.....	160
1.1.3.2	Related Documentation.....	160
1.1.4	Conventions.....	160
1.1.5	Register Access.....	162
1.1.5.1	Register Diagram Field Access Type Legend.....	162
1.1.5.2	Register Macro Usage.....	163
1.1.6	Signal Conventions.....	164
1.1.7	Acronyms and Abbreviations.....	164
1.2	Introduction.....	167
1.3	Target Applications.....	167
1.4	Features.....	167
1.5	Architectural Overview.....	171
1.5.1	Simplified Block Diagram.....	171
1.5.2	Architectural Partitioning.....	172
1.5.3	Endianness Support.....	174
1.5.4	Memory Interfaces.....	174
<b>Chapter 2 Memory Maps</b>		
2.1	Memory system overview.....	175
2.2	ARM Platform Memory Map.....	175
2.3	DMA memory map.....	181
<b>Chapter 3</b>		

Section number	Title	Page
	<b>Interrupts and DMA Events</b>	
3.1	Overview.....	183
3.2	Cortex A7 interrupts.....	183
3.3	SDMA event mapping.....	188
	<b>Chapter 4 External Signals and Pin Multiplexing</b>	
4.1	Overview.....	191
4.1.1	Muxing Options.....	191
	<b>Chapter 5 Fusemap</b>	
5.1	Boot Fusemap.....	215
5.2	Lock Fusemap.....	226
5.3	Fusemap Descriptions Table.....	227
	<b>Chapter 6 External Memory Controllers</b>	
6.1	Overview.....	235
6.2	Multi-mode DDR controller (MMDC) overview and feature summary.....	235
6.3	EIM-PSRAM/NOR flash controller overview.....	236
6.3.1	EIM features.....	236
6.3.2	EIM boot scenarios.....	237
6.3.3	EIM boot configuration.....	237
6.3.4	OneNAND requirements.....	238
	<b>Chapter 7 System Debug</b>	
7.1	Overview.....	239
7.2	Chip and ARM Platform Debug Architecture.....	239
7.2.1	Debug Features.....	240
7.2.2	Debug system components.....	240
7.2.2.1	AMBA Trace Bus (ATB).....	241
7.2.2.2	ATB replicator.....	241

<b>Section number</b>	<b>Title</b>	<b>Page</b>
7.2.2.3	Embedded Cross Triggering.....	241
7.2.2.3.1	Cross-Trigger Matrix (CTM).....	242
7.2.2.3.2	Cross-Trigger Interface (CTI).....	243
7.2.2.4	Debug Access Port (DAP).....	243
7.2.3	Chip-Specific SJC Features.....	244
7.2.3.1	JTAG Disable Mode.....	244
7.2.3.2	JTAG ID.....	244
7.2.4	System JTAG Controller - SJC.....	244
7.2.5	System JTAG controller main features.....	245
7.2.6	SJC TAP Port.....	245
7.2.7	SJC main blocks.....	245
7.3	Smart DMA (SDMA) core.....	246
7.3.1	SDMA On Chip Emulation Module (OnCE) Feature Summary.....	246
7.3.1.1	Other SDMA Debug Functionality.....	247
7.3.1.2	SDMA ROM Patching.....	248
7.4	Miscellaneous.....	248
7.4.1	Clock/Reset/Power.....	248
7.5	Supported tools.....	248

## **Chapter 8 System Boot**

8.1	Overview.....	249
8.2	Boot modes.....	250
8.2.1	Boot mode pin settings.....	251
8.2.2	High-level boot sequence.....	251
8.2.3	Boot From Fuses mode (BOOT_MODE[1:0] = 00b).....	252
8.2.4	Serial Downloader.....	253
8.2.5	Internal Boot mode (BOOT_MODE[1:0] = 0b10).....	255
8.2.6	Boot security settings.....	255
8.3	Device configuration.....	256

<b>Section number</b>	<b>Title</b>	<b>Page</b>
8.3.1	Boot eFUSE descriptions.....	256
8.3.2	GPIO boot overrides.....	258
8.3.3	Device Configuration Data (DCD).....	259
8.4	Device initialization.....	259
8.4.1	Internal ROM/RAM memory map.....	260
8.4.2	Boot block activation .....	260
8.4.3	Clocks at boot time.....	261
8.4.4	Enabling MMU and caches.....	263
8.4.5	Exception handling.....	264
8.4.6	Interrupt handling during boot.....	264
8.4.7	Persistent bits.....	264
8.5	Boot devices (internal boot).....	265
8.5.1	NOR flash/OneNAND using EIM interface.....	266
8.5.1.1	NOR flash boot operation.....	266
8.5.1.2	OneNAND flash boot operation.....	267
8.5.1.3	IOMUX configuration for EIM devices.....	268
8.5.2	NAND flash.....	269
8.5.2.1	NAND eFUSE configuration.....	269
8.5.2.2	NAND flash boot flow and Boot Control Blocks (BCB).....	271
8.5.2.3	Firmware configuration block.....	275
8.5.2.4	Discovered Bad Block Table (DBBT).....	278
8.5.2.5	Bad block handling in ROM.....	278
8.5.2.6	Read-retry handling in the ROM.....	279
8.5.2.7	Toggle mode DDR NAND boot.....	281
8.5.2.7.1	GPMI and BCH clocks configuration.....	281
8.5.2.7.2	Setup DMA for DDR transfers.....	282
8.5.2.7.3	Reconfigure timing and speed using values in FCB.....	282
8.5.2.8	Typical NAND page organization.....	283
8.5.2.8.1	BCH ECC page organization.....	283

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	8.5.2.8.2 Metadata.....	284
8.5.2.9	IOMUX configuration for NAND.....	284
8.5.3	Expansion device.....	285
	8.5.3.1 Expansion device eFUSE configuration.....	285
	8.5.3.2 MMC and eMMC boot.....	288
	8.5.3.3 SD, eSD, and SDXC.....	297
	8.5.3.4 IOMUX configuration for SD/MMC.....	297
	8.5.3.5 Redundant boot support for expansion device.....	298
8.5.4	Serial ROM through SPI.....	300
	8.5.4.1 Serial ROM eFUSE configuration.....	300
	8.5.4.2 ECSPI boot.....	301
	8.5.4.2.1 ECSPI IOMUX pin configuration.....	302
8.6	QuadSPI serial flash memory boot.....	303
	8.6.1 QuadSPI eFUSE configuration.....	303
	8.6.2 QuadSPI serial flash BOOT operation.....	303
	8.6.3 QuadSPI configuration parameters.....	304
	8.6.4 IOMUX configuration for QSPI devices.....	307
	8.6.5 QuadSPI boot flow chart.....	308
8.7	Program image.....	309
	8.7.1 Image Vector Table and Boot Data.....	309
	8.7.1.1 Image vector table structure.....	310
	8.7.1.2 Boot data structure.....	311
	8.7.2 Device Configuration Data (DCD).....	311
	8.7.2.1 Write data command.....	312
	8.7.2.2 Check data command.....	314
	8.7.2.3 NOP command.....	315
	8.7.2.4 Unlock command.....	316
8.8	Plugin image.....	316
8.9	Serial Downloader.....	317

<b>Section number</b>	<b>Title</b>	<b>Page</b>
8.9.1	USB.....	320
8.9.1.1	USB configuration details.....	320
8.9.1.2	IOMUX configuration for USB.....	321
8.9.2	UART.....	321
8.9.2.1	UART configuration details.....	321
8.9.2.2	UART eFUSE configuration.....	322
8.9.2.3	IOMUX configuration for UART.....	322
8.9.3	Serial Download Protocol (SDP).....	322
8.9.3.1	SDP commands.....	323
8.9.3.1.1	READ_REGISTER.....	323
8.9.3.1.2	WRITE_REGISTER.....	324
8.9.3.1.3	WRITE_FILE.....	325
8.9.3.1.4	ERROR_STATUS.....	326
8.9.3.1.5	DCD_WRITE.....	326
8.9.3.1.6	SKIP_DCD_HEADER.....	327
8.9.3.1.7	JUMP_ADDRESS.....	328
8.10	Recovery devices.....	329
8.11	USB low-power boot.....	329
8.12	SD/MMC manufacture mode.....	331
8.13	High-Assurance Boot (HAB).....	332
8.13.1	HAB API vector table addresses.....	333

## **Chapter 9** **Multimedia**

9.1	Display and graphics subsystem.....	335
9.1.1	Electrophoretic Display Controller.....	336
9.1.2	PiXel Processing Pipeline (PXP).....	337
9.1.3	LCD Interface (LCDIF).....	337
9.1.4	CMOS Sensor Interface (CSI).....	337
9.2	Audio subsystem.....	338

<b>Section number</b>	<b>Title</b>	<b>Page</b>
9.2.1	Audio Subsystem Module Overview.....	338
9.2.2	Medium Quality Sound (MQS).....	340
9.2.3	Synchronous Audio Interface (SAI).....	340
9.2.4	Enhanced Serial Audio Interface (ESAI).....	340
9.2.5	Sony/Philips Digital Interface (SPDIF).....	341
9.2.6	Asynchronous Sample Rate Converter (ASRC).....	342

## **Chapter 10 Clock and Power Management**

10.1	Introduction.....	345
10.2	Device Power Management Architecture Components.....	345
10.2.1	Centralized components of clock generation and management.....	346
10.2.2	Centralized components of power generation, distribution and management.....	347
10.2.3	Reset generation and distribution system.....	347
10.2.4	Power and clock management framework.....	347
10.3	Clock Management.....	348
10.3.1	Centralized components of clock management system.....	348
10.3.2	Clock generation.....	350
10.3.2.1	Crystal Oscillator (XTALOSC) .....	351
10.3.2.2	Low Voltage Differential Signaling (LVDS) I/O ports.....	351
10.3.2.3	PLLs.....	351
10.3.2.3.1	General PLL Control and Status Functions.....	352
10.3.2.4	CCM .....	354
10.3.2.5	Low Power Clock Gating unit (LPCG).....	354
10.3.3	Peripheral components of clock management system.....	355
10.3.3.1	Interface and functional clock.....	355
10.3.3.2	Block level clock management.....	356
10.3.3.2.1	Master clock protocol.....	356
10.3.3.2.2	Slave clock protocol.....	357
10.3.3.3	Clock Domain(s).....	357

<b>Section number</b>	<b>Title</b>	<b>Page</b>
10.3.3.4	Domain level clock management.....	357
10.3.3.5	Domain dependencies.....	357
10.4	Power management.....	358
10.4.1	Centralized Components of Power Management System.....	358
10.4.1.1	Integrated PMU.....	359
10.4.1.1.1	Digital LDO Regulators.....	361
10.4.1.1.2	Analog LDO regulators.....	362
10.4.1.1.3	USB LDO.....	362
10.4.1.1.4	SNVS regulator.....	362
10.4.1.2	GPC - General Power Controller.....	363
10.4.1.3	SRC - System reset Controller.....	363
10.4.1.4	Power domain(s).....	364
10.4.1.4.1	Power distribution .....	364
10.4.1.4.2	Domain Memory and domain logic state retention in case of Power Gating.	365
10.4.1.4.3	Power Gating Domain Management.....	366
10.4.1.4.3.1	ARM Core Platform.....	366
10.4.1.4.3.2	SOC_PD.....	367
10.4.1.4.3.3	SoC.....	367
10.4.1.4.4	Power Gating domain dependencies.....	368
10.4.1.5	Voltage domains.....	368
10.4.1.6	Voltage domain management.....	369
10.4.1.6.1	Dynamic.....	369
10.4.1.6.1.1	Voltage Scaling.....	369
10.4.1.6.2	Static .....	369
10.4.1.6.2.1	Standby Leakage reduction (SLR).....	369
10.4.1.6.2.2	ANALOG PHYs IPs.....	370
10.4.1.7	System domains layout.....	370
10.4.2	Power management techniques.....	372
10.4.2.1	Power saving techniques.....	373

<b>Section number</b>	<b>Title</b>	<b>Page</b>
10.4.2.2	Thermal-aware power management.....	374
10.4.2.3	Peripheral Power management.....	374
10.4.2.3.1	Main memory power management.....	374
10.4.2.3.2	Video-Graphics system power management.....	375
10.4.2.3.3	IO power reduction.....	375
10.4.3	Examples of External Power Supply Interface.....	376
10.5	ONOFF (Button).....	378

## **Chapter 11 System Security**

11.1	Overview.....	381
11.2	Central Security Unit (CSU).....	382
11.2.1	CSU Overview.....	382
11.2.2	CSU Features.....	382
11.2.3	CSU Functional Description.....	382
11.2.3.1	CSU Peripheral Access Policy.....	383
11.3	Secure Non-Volatile Storage (SNVS).....	384
11.3.1	SNVS Overview.....	384
11.3.2	Tamper Detection.....	384
11.4	Data Co-Processor (DCP).....	385
11.5	High-Assurance Boot (HAB).....	385
11.6	System JTAG Controller (SJC).....	386

## **Chapter 12 ARM Cortex A7 Platform (CA7)**

12.1	Overview.....	387
12.2	External Signals.....	388
12.3	Clocks.....	388
12.4	Platform Configuration.....	388
12.5	Low-Power and Performance.....	389

## **Chapter 13 Analog-to-Digital Converter (ADC)**

<b>Section number</b>	<b>Title</b>	<b>Page</b>
13.1	Overview.....	391
13.1.1	Features.....	391
13.1.2	ADC I/F block diagram.....	392
13.1.3	ADC block diagram.....	392
13.1.4	ADC module interface.....	393
13.1.5	Modes of Operation.....	394
13.2	External Signals.....	394
13.3	Functional Description.....	396
13.3.1	Clock Select and Divide Control.....	397
13.3.2	Voltage Reference Selection .....	398
13.3.3	Conversion Control.....	398
13.3.3.1	Initiating Conversions.....	399
13.3.3.2	Completing Conversions.....	399
13.3.3.3	Aborting Conversions.....	400
13.3.3.4	Power Control.....	401
13.3.3.5	Sample Time and Total Conversion Time.....	401
13.3.3.6	Conversion Time Examples.....	403
13.3.3.6.1	Typical conversion time configuration.....	403
13.3.3.6.2	Long conversion time configuration.....	404
13.3.3.6.3	Short conversion time configuration.....	404
13.3.3.7	Hardware Average Function.....	405
13.3.4	Automatic Compare Function.....	405
13.3.5	Calibration Function.....	406
13.3.6	User Defined Offset Function .....	408
13.3.7	MCU Wait Mode Operation.....	408
13.3.8	MCU Stop Mode Operation.....	409
13.3.8.1	Stop Mode With ADACK Disabled.....	409
13.3.8.2	Stop Mode With ADACK Enabled.....	409
13.4	Initialization Information.....	410

<b>Section number</b>	<b>Title</b>	<b>Page</b>
13.4.1	ADC Module Initialization Example.....	410
13.4.1.1	Initialization Sequence.....	410
13.4.1.2	Pseudo-Code Example.....	411
13.5	Application Information.....	412
13.5.1	Sources of Error.....	412
13.5.1.1	Sampling Error.....	412
13.5.1.2	Pin Leakage Error.....	413
13.5.1.3	Noise-Induced Errors.....	413
13.5.1.4	Code Width and Quantization Error.....	414
13.5.1.5	Linearity Errors.....	414
13.5.1.6	Code Jitter, Non-Monotonicity, and Missing Codes.....	415
13.6	Memory map and register definition.....	416
13.6.1	Control register (ADC <sub>x</sub> _HC0).....	417
13.6.2	Status register (ADC <sub>x</sub> _HS).....	418
13.6.3	Data result register (ADC <sub>x</sub> _R0).....	419
13.6.4	Configuration register (ADC <sub>x</sub> _CFG).....	420
13.6.5	General control register (ADC <sub>x</sub> _GC).....	422
13.6.6	General status register (ADC <sub>x</sub> _GS).....	424
13.6.7	Compare value register (ADC <sub>x</sub> _CV).....	425
13.6.8	Offset correction value register (ADC <sub>x</sub> _OFS).....	426
13.6.9	Calibration value register (ADC <sub>x</sub> _CAL).....	427
13.7	Memory map and register definition.....	427
13.7.1	Control register for hardware triggers (ADC <sub>x</sub> _HC0).....	429
13.7.2	Control register for hardware triggers (ADC <sub>x</sub> _HC <sub>n</sub> ).....	430
13.7.3	Status register for HW triggers (ADC <sub>x</sub> _HS).....	432
13.7.4	Data result register for HW triggers (ADC <sub>x</sub> _R0).....	433
13.7.5	Data result register for HW triggers (ADC <sub>x</sub> _R <sub>n</sub> ).....	434
13.7.6	Configuration register (ADC <sub>x</sub> _CFG).....	435
13.7.7	General control register (ADC <sub>x</sub> _GC).....	437

<b>Section number</b>	<b>Title</b>	<b>Page</b>
13.7.8	General status register (ADC <sub>x</sub> _GS).....	439
13.7.9	Compare value register (ADC <sub>x</sub> _CV).....	440
13.7.10	Offset correction value register (ADC <sub>x</sub> _OFS).....	441
13.7.11	Calibration value register (ADC <sub>x</sub> _CAL).....	442

## **Chapter 14 AHB to IP Bridge (AIPSTZ)**

14.1	Overview.....	443
14.1.1	Features.....	443
14.2	Clocks.....	443
14.3	Functional Description.....	444
14.4	Access Protections.....	445
14.5	Access Support.....	445
14.6	Initialization Information.....	446
14.6.1	Security Block.....	446
14.7	AIPSTZ Memory Map/Register Definition.....	447
14.7.1	Master Priviledge Registers (AIPSTZ <sub>x</sub> _MPR).....	449
14.7.2	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR).....	451
14.7.3	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR1).....	454
14.7.4	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR2).....	457
14.7.5	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR3).....	460
14.7.6	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR4).....	463

## **Chapter 15 AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)**

15.1	Overview.....	465
15.2	Clocks.....	466
15.3	APBH DMA.....	467
15.4	NAND Read Status Polling Example.....	472
15.5	APBH Memory Map/Register Definition.....	474
15.5.1	AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0 <sub>n</sub> ).....	480

<b>Section number</b>	<b>Title</b>	<b>Page</b>
15.5.2	AHB to APBH Bridge Control and Status Register 1 (APBH_CTRL1 $n$ ).....	481
15.5.3	AHB to APBH Bridge Control and Status Register 2 (APBH_CTRL2 $n$ ).....	485
15.5.4	AHB to APBH Bridge Channel Register (APBH_CHANNEL_CTRL $n$ ).....	490
15.5.5	AHB to APBH DMA Device Assignment Register (APBH_DEVSEL).....	491
15.5.6	AHB to APBH DMA burst size (APBH_DMA_BURST_SIZE).....	492
15.5.7	AHB to APBH DMA Debug Register (APBH_DEBUG).....	493
15.5.8	APBH DMA Channel n Current Command Address Register (APBH_CH $n$ _CURCMDAR).....	494
15.5.9	APBH DMA Channel n Next Command Address Register (APBH_CH $n$ _NXTCMDAR).....	495
15.5.10	APBH DMA Channel n Command Register (APBH_CH $n$ _CMD).....	495
15.5.11	APBH DMA Channel n Buffer Address Register (APBH_CH $n$ _BAR).....	497
15.5.12	APBH DMA Channel n Semaphore Register (APBH_CH $n$ _SEMA).....	498
15.5.13	AHB to APBH DMA Channel n Debug Information (APBH_CH $n$ _DEBUG1).....	499
15.5.14	AHB to APBH DMA Channel n Debug Information (APBH_CH $n$ _DEBUG2).....	502
15.5.15	APBH Bridge Version Register (APBH_VERSION).....	503

## Chapter 16 Asynchronous Sample Rate Converter (ASRC)

16.1	Overview.....	505
16.1.1	Features.....	507
16.1.2	Modes of Operation.....	508
16.1.2.1	Data Transfer Schemes.....	508
16.1.2.1.1	Data Input Modes.....	508
16.1.2.1.2	Data Output Modes.....	510
16.1.2.2	Word Alignment Supported .....	511
16.1.2.2.1	Input Data Alignment Modes .....	511
16.1.2.2.2	Output Data Alignment Modes .....	511
16.2	Clocks.....	512
16.3	Interrupts.....	512
16.4	DMA requests.....	513
16.5	Functional Description.....	513

<b>Section number</b>	<b>Title</b>	<b>Page</b>
16.5.1	Algorithm Description.....	513
16.5.1.1	Signal processing flow.....	513
16.5.1.2	Operation of the Filter.....	517
16.5.1.2.1	Support of Physical Clocks.....	517
16.6	Startup Procedure.....	519
16.7	ASRC Memory Map/Register Definition.....	523
16.7.1	ASRC Control Register (ASRC_ASRCTR).....	526
16.7.2	ASRC Interrupt Enable Register (ASRC_ASRIER).....	529
16.7.3	ASRC Channel Number Configuration Register (ASRC_ASRCNCR).....	530
16.7.4	ASRC Filter Configuration Status Register (ASRC_ASRCFG).....	532
16.7.5	ASRC Clock Source Register (ASRC_ASRCCSR).....	534
16.7.6	ASRC Clock Divider Register 1 (ASRC_ASRCDR1).....	537
16.7.7	ASRC Clock Divider Register 2 (ASRC_ASRCDR2).....	538
16.7.8	ASRC Status Register (ASRC_ASRSTR).....	539
16.7.9	ASRC Parameter Register n (ASRC_ASRPM $n$ ).....	542
16.7.10	ASRC ASRC Task Queue FIFO Register 1 (ASRC_ASRTFRI).....	543
16.7.11	ASRC Channel Counter Register (ASRC_ASRCCR).....	544
16.7.12	ASRC Data Input Register for Pair x (ASRC_ASRDIn).....	545
16.7.13	ASRC Data Output Register for Pair x (ASRC_ASRDOn).....	545
16.7.14	ASRC Ideal Ratio for Pair A-High Part (ASRC_ASRIDRHA).....	546
16.7.15	ASRC Ideal Ratio for Pair A -Low Part (ASRC_ASRIDRLA).....	546
16.7.16	ASRC Ideal Ratio for Pair B-High Part (ASRC_ASRIDRHB).....	547
16.7.17	ASRC Ideal Ratio for Pair B-Low Part (ASRC_ASRIDRLB).....	547
16.7.18	ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC).....	548
16.7.19	ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC).....	548
16.7.20	ASRC 76 kHz Period in terms of ASRC processing clock (ASRC_ASR76K).....	549
16.7.21	ASRC 56 kHz Period in terms of ASRC processing clock (ASRC_ASR56K).....	550
16.7.22	ASRC Misc Control Register for Pair A (ASRC_ASRCMCRA).....	551
16.7.23	ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA).....	553

Section number	Title	Page
16.7.24	ASRC Misc Control Register for Pair B (ASRC_ASRMCRB).....	554
16.7.25	ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB).....	556
16.7.26	ASRC Misc Control Register for Pair C (ASRC_ASRMCRC).....	557
16.7.27	ASRC FIFO Status Register for Pair C (ASRC_ASRFSTC).....	559
16.7.28	ASRC Misc Control Register 1 for Pair X (ASRC_ASRMCR1n).....	560

## Chapter 17 40-BIT Correcting ECC Accelerator (BCH)

17.1	Overview.....	563
17.2	Operation.....	565
17.2.1	BCH Limitations and Assumptions.....	566
17.2.2	Flash Page Layout.....	567
17.2.3	Determining the ECC layout for a device.....	569
17.2.3.1	4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(213).....	569
17.2.3.2	4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(213) for data and GF(214) for metadata.....	570
17.2.4	Data Buffers in System Memory.....	570
17.3	Memory to Memory (Loopback) Operation.....	572
17.4	Programming the BCH/GPMI Interfaces.....	573
17.4.1	BCH Encoding for NAND Writes.....	573
17.4.1.1	DMA Structure Code Example.....	576
17.4.1.2	Using the BCH Encoder.....	581
17.4.2	BCH Decoding for NAND Reads.....	582
17.4.2.1	DMA Structure Code Example.....	586
17.4.2.2	Using the Decoder.....	589
17.4.3	Interrupts.....	591
17.5	Behavior During Reset.....	592
17.6	BCH Memory Map/Register Definition.....	593
17.6.1	Hardware BCH ECC Accelerator Control Register (BCH_CTRLn).....	597
17.6.2	Hardware ECC Accelerator Status Register 0 (BCH_STATUS0n).....	599

<b>Section number</b>	<b>Title</b>	<b>Page</b>
17.6.3	Hardware ECC Accelerator Mode Register (BCH_MODE $n$ ).....	601
17.6.4	Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR $n$ ).....	602
17.6.5	Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR $n$ ).....	602
17.6.6	Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR $n$ ).....	603
17.6.7	Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT $n$ ).....	603
17.6.8	Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0 $n$ ).....	604
17.6.9	Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1 $n$ ).....	606
17.6.10	Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0 $n$ ).....	607
17.6.11	Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1 $n$ ).....	609
17.6.12	Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0 $n$ ).....	610
17.6.13	Hardware BCH ECC Flash 2 Layout 1 Register (BCH_FLASH2LAYOUT1 $n$ ).....	612
17.6.14	Hardware BCH ECC Flash 3 Layout 0 Register (BCH_FLASH3LAYOUT0 $n$ ).....	613
17.6.15	Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1 $n$ ).....	615
17.6.16	Hardware BCH ECC Debug Register0 (BCH_DEBUG0 $n$ ).....	616
17.6.17	KES Debug Read Register (BCH_DBGKESREAD $n$ ).....	618
17.6.18	Chien Search Debug Read Register (BCH_DBGCSFEREAD $n$ ).....	619
17.6.19	Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD $n$ ).....	619
17.6.20	Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD $n$ ).....	620
17.6.21	Block Name Register (BCH_BLOCKNAME $n$ ).....	620
17.6.22	BCH Version Register (BCH_VERSION $n$ ).....	621
17.6.23	Hardware BCH ECC Debug Register 1 (BCH_DEBUG1 $n$ ).....	622

## Chapter 18 Clock Controller Module (CCM)

18.1	Overview.....	625
18.1.1	Features.....	625
18.1.2	CCM Block Diagram.....	626
18.2	External Signals.....	628
18.3	CCM Clock Tree.....	628
18.4	System Clocks.....	630

<b>Section number</b>	<b>Title</b>	<b>Page</b>
18.5 Functional Description.....		643
18.5.1 Clock Generation.....		643
18.5.1.1 External Low Frequency Clock - CKIL .....	643	
18.5.1.1.1 CKIL synchronizing to IPG_CLK.....	644	
18.5.1.2 External High Frequency Clock - CKIH and internal oscillator.....	644	
18.5.1.3 PLL reference clock.....	644	
18.5.1.3.1 ARM PLL.....	644	
18.5.1.3.2 USB PLLs.....	645	
18.5.1.3.3 System PLL.....	645	
18.5.1.3.4 Audio / Video PLL.....	645	
18.5.1.3.5 Ethernet PLL.....	646	
18.5.1.4 Phase Fractional Dividers (PFD).....	646	
18.5.1.5 CCM internal clock generation.....	646	
18.5.1.5.1 Clock Switcher.....	647	
18.5.1.5.2 PLL bypass procedure.....	649	
18.5.1.5.3 PLL clock change.....	649	
18.5.1.5.4 Clock Root Generator.....	649	
18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).....	651	
18.5.1.5.6 Divider change handshake.....	651	
18.5.1.6 Disabling / Enabling PLLs.....	651	
18.5.1.7 Clock Switching Multiplexers.....	652	
18.5.1.8 Low Power Clock Gating module (LPCG).....	653	
18.5.1.9 MMDC handshake.....	654	
18.5.2 DVFS support.....		655
18.5.3 Power modes.....		655
18.5.3.1 RUN mode.....	655	
18.5.3.2 WAIT mode.....	656	
18.5.3.2.1 Entering WAIT mode .....	656	
18.5.3.2.2 Exiting WAIT mode .....	656	

<b>Section number</b>	<b>Title</b>	<b>Page</b>
18.5.3.3	STOP mode.....	657
18.5.3.3.1	Entering STOP mode .....	657
18.5.3.3.2	Exiting STOP mode.....	657
18.6	CCM Memory Map/Register Definition.....	658
18.6.1	CCM Control Register (CCM_CCR).....	660
18.6.2	CCM Control Divider Register (CCM_CCDDR).....	661
18.6.3	CCM Status Register (CCM_CSR).....	663
18.6.4	CCM Clock Switcher Register (CCM_CCSR).....	664
18.6.5	CCM Arm Clock Root Register (CCM_CACRR).....	665
18.6.6	CCM Bus Clock Divider Register (CCM_CBCDR).....	666
18.6.7	CCM Bus Clock Multiplexer Register (CCM_CBCMR).....	669
18.6.8	CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1).....	670
18.6.9	CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2).....	673
18.6.10	CCM Serial Clock Divider Register 1 (CCM_CSCDR1).....	674
18.6.11	CCM SAI1 Clock Divider Register (CCM_CS1CDR).....	676
18.6.12	CCM SAI2 Clock Divider Register (CCM_CS2CDR).....	678
18.6.13	CCM D1 Clock Divider Register (CCM_CDCCDR).....	680
18.6.14	CCM HSC Clock Divider Register (CCM_CHSCCDR).....	681
18.6.15	CCM Serial Clock Divider Register 2 (CCM_CSCDR2).....	682
18.6.16	CCM Serial Clock Divider Register 3 (CCM_CSCDR3).....	684
18.6.17	CCM Divider Handshake In-Process Register (CCM_CDHIPR).....	685
18.6.18	CCM Low Power Control Register (CCM_CLPCR).....	688
18.6.19	CCM Interrupt Status Register (CCM_CISR).....	690
18.6.20	CCM Interrupt Mask Register (CCM_CIMR).....	693
18.6.21	CCM Clock Output Source Register (CCM_CCOSR).....	695
18.6.22	CCM General Purpose Register (CCM_CGPR).....	697
18.6.23	CCM Clock Gating Register 0 (CCM_CCGR0).....	698
18.6.24	CCM Clock Gating Register 1 (CCM_CCGR1).....	700
18.6.25	CCM Clock Gating Register 2 (CCM_CCGR2).....	702

<b>Section number</b>	<b>Title</b>	<b>Page</b>
18.6.26	CCM Clock Gating Register 3 (CCM_CCGR3).....	703
18.6.27	CCM Clock Gating Register 4 (CCM_CCGR4).....	704
18.6.28	CCM Clock Gating Register 5 (CCM_CCGR5).....	706
18.6.29	CCM Clock Gating Register 6 (CCM_CCGR6).....	707
18.6.30	CCM Module Enable Overide Register (CCM_CMEOR).....	709
18.7	CCM Analog Memory Map/Register Definition.....	710
18.7.1	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM $n$ ).....	714
18.7.2	Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1 $n$ ).....	716
18.7.3	Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2 $n$ ).....	718
18.7.4	Analog System PLL Control Register (CCM_ANALOG_PLL_SYS $n$ ).....	720
18.7.5	528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS).....	722
18.7.6	Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM).....	722
18.7.7	Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM).....	723
18.7.8	Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO $n$ ).....	724
18.7.9	Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM).....	726
18.7.10	Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM).....	727
18.7.11	Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO $n$ ).....	728
18.7.12	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM).....	730
18.7.13	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).....	731
18.7.14	Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET $n$ ).....	732
18.7.15	480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 $n$ ).....	734
18.7.16	528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528 $n$ ).....	736
18.7.17	Miscellaneous Register 0 (CCM_ANALOG_MISC0 $n$ ).....	739
18.7.18	Miscellaneous Register 1 (CCM_ANALOG_MISC1 $n$ ).....	743
18.7.19	Miscellaneous Register 2 (CCM_ANALOG_MISC2 $n$ ).....	746

## Chapter 19

Section number	Title	Page
	<b>CMOS Sensor Interface (CSI)</b>	
19.1	Overview.....	751
19.2	External Signals.....	752
19.3	Clocks.....	754
19.4	Principles of Operation.....	754
19.4.1	Data Transfer with the Embedded DMA Controllers.....	756
19.4.2	Gated Clock Mode.....	757
19.4.3	Non-Gated Clock Mode.....	757
19.4.4	CCIR656 Interlace Mode.....	758
19.4.5	CCIR656 Progressive Mode.....	760
19.4.6	Error Correction for CCIR656 Coding.....	761
19.4.7	Deinterlacer.....	761
19.5	Interrupt Generation.....	762
19.5.1	Start Of Frame Interrupt (SOF_INT).....	762
19.5.2	End Of Frame Interrupt (EOF_INT).....	762
19.5.3	Change Of Field Interrupt (COF_INT).....	762
19.5.4	CCIR Error Interrupt (ECC_INT).....	763
19.5.5	RxFIFO Full Interrupt (RxFF_INT).....	763
19.5.6	Statistic FIFO Full Interrupt (STATFF_INT).....	763
19.5.7	RxFIFO Overrun Interrupt (RFF_OR_INT).....	763
19.5.8	Statistic FIFO Overrun Interrupt (SFF_OR_INT).....	763
19.5.9	Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1).....	764
19.5.10	Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2).....	764
19.5.11	Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF).....	764
19.5.12	AHB Bus Response Error Interrupt (HRESP_ERR_INT).....	764
19.5.13	DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE).....	764
19.5.14	DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE).....	764
19.5.15	Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR).....	765
19.6	Data Packing Style.....	765

<b>Section number</b>	<b>Title</b>	<b>Page</b>
19.6.1	RX FIFO Path.....	766
19.6.1.1	Bayer Data.....	766
19.6.1.2	RGB565 Data.....	766
19.6.1.3	RGB888 Data.....	767
19.6.2	STAT FIFO Path.....	769
19.7	CSI Memory Map/Register Definition.....	769
19.7.1	CSI Control Register 1 (CSI_CSICR1).....	771
19.7.2	CSI Control Register 2 (CSI_CSICR2).....	775
19.7.3	CSI Control Register 3 (CSI_CSICR3).....	777
19.7.4	CSI Statistic FIFO Register (CSI_CSISTATFIFO).....	779
19.7.5	CSI RX FIFO Register (CSI_CSIRFIFO).....	780
19.7.6	CSI RX Count Register (CSI_CSIRXCNT).....	780
19.7.7	CSI Status Register (CSI_CSISR).....	781
19.7.8	CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO).....	784
19.7.9	CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO).....	784
19.7.10	CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1).....	785
19.7.11	CSI DMA Transfer Size Register - for Frame Buffer2 (CSI_CSIDMASA_FB2).....	786
19.7.12	CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA).....	786
19.7.13	CSI Image Parameter Register (CSI_CSIIMAG_PARA).....	787
19.7.14	CSI Control Register 18 (CSI_CSICR18).....	788
19.7.15	CSI Control Register 19 (CSI_CSICR19).....	790

## **Chapter 20** **Enhanced Configurable SPI (ECSPI)**

20.1	Overview.....	791
20.1.1	Features.....	792
20.1.2	Modes and Operations.....	792
20.2	External Signals.....	793
20.3	Clocks.....	794
20.4	Functional Description.....	794

<b>Section number</b>	<b>Title</b>	<b>Page</b>
20.4.1	Master Mode.....	795
20.4.2	Slave Mode.....	795
20.4.3	Low Power Modes.....	795
20.4.4	Operations.....	795
20.4.4.1	Typical Master Mode.....	795
	20.4.4.1.1    Master Mode with SPI_RDY.....	796
	20.4.4.1.2    Master Mode with Wait States.....	798
	20.4.4.1.3    Master Mode with SS_CTL[3:0] Control.....	798
	20.4.4.1.4    Master Mode with Phase Control.....	799
20.4.4.2	Typical Slave Mode.....	800
20.4.5	Reset.....	801
20.4.6	Interrupts.....	801
20.4.7	DMA .....	802
20.4.8	Byte Order.....	803
20.5	Initialization.....	804
20.6	Applications.....	804
20.7	ECSPI Memory Map/Register Definition.....	805
20.7.1	Receive Data Register (ECSPIx_RXDATA).....	806
20.7.2	Transmit Data Register (ECSPIx_TXDATA).....	807
20.7.3	Control Register (ECSPIx_CONREG).....	807
20.7.4	Config Register (ECSPIx_CONFIGREG).....	810
20.7.5	Interrupt Control Register (ECSPIx_INTREG).....	812
20.7.6	DMA Control Register (ECSPIx_DMAREG).....	813
20.7.7	Status Register (ECSPIx_STATREG).....	815
20.7.8	Sample Period Control Register (ECSPIx_PERIODREG).....	816
20.7.9	Test Control Register (ECSPIx_TESTREG).....	818
20.7.10	Message Data Register (ECSPIx_MSGDATA).....	819

## Chapter 21 External Interface Module (EIM)

<b>Section number</b>	<b>Title</b>	<b>Page</b>
21.1	Overview.....	821
21.1.1	Features.....	823
21.1.2	Modes of Operation.....	823
21.1.2.1	Asynchronous Mode.....	824
21.1.2.2	Asynchronous Page Read Mode.....	824
21.1.2.3	Multiplexed Address/Data Mode.....	824
21.1.2.4	Burst Clock Mode.....	825
21.1.2.5	Low Power Modes.....	825
21.1.2.6	Boot Mode.....	826
21.2	External Signals.....	826
21.2.1	Other Important Block I/O Signals Internal to the SoC.....	826
21.3	Clocks.....	826
21.4	Chip Select Memory Map.....	827
21.5	Functional Description.....	828
21.5.1	Bus Sizing Configuration.....	828
21.5.1.1	8 BIT PORT SUPPORT.....	828
21.5.1.1.1	MOTOROLA 68000.....	828
21.5.1.1.2	INTEL 386.....	829
21.5.1.2	EIM Operational Modes.....	829
21.5.1.3	Burst Mode (Synchronous) Memory Operation.....	829
21.5.1.4	Burst Clock Divisor (BCD).....	830
21.5.1.5	Burst Clock Start (BCS).....	831
21.5.1.6	Multiplexed Address/Data Mode Support.....	831
21.5.1.7	Mixed Master/Memory Burst Modes Support.....	831
21.5.1.8	AXI (Master) Bus Cycles Support.....	832
21.5.1.9	WAIT_B Signal, RWSC and WWSR bit fields Usage.....	834
21.5.1.10	IPS Register Interface.....	835
21.5.1.11	MRS Set for PSRAM.....	835
21.5.1.12	EIM Access Termination .....	835

<b>Section number</b>	<b>Title</b>	<b>Page</b>
21.5.13	Error Conditions.....	835
21.5.14	DTACK Mode.....	836
21.5.15	EIM_GRANT / EIM_BUSY Handshake Description.....	837
21.5.16	LPMD / LPACK Handshake Description.....	837
21.5.17	Endianness.....	837
21.5.18	Strobe Signal Use.....	838
21.6	Initialization Information.....	839
21.6.1	Booting from EIM.....	839
21.7	Typical Application.....	839
21.7.1	Access to Intel Sibley Flash.....	840
21.7.1.1	Intel Sibley Flash Asynchronous Mode Configuration.....	840
21.7.1.2	Intel Sibley Flash Synchronous Mode Configuration.....	840
21.7.1.3	Intel Sibley Flash Utility.....	840
21.7.2	Access to MDOC Device.....	841
21.7.2.1	MDOC Device Boot.....	841
21.7.2.2	MDOC Device Asynchronous Mode Configuration.....	841
21.7.2.3	MDOC Device Utility.....	841
21.7.3	Access to Micron PSRAM .....	841
21.7.3.1	Micron PSRAM Asynchronous Mode Configuration.....	842
21.7.3.2	Micron PSRAM Synchronous Mode Configuration.....	842
21.7.4	Access to Samsung OneNAND .....	842
21.7.4.1	Samsung OneNAND Boot.....	842
21.7.4.2	Samsung OneNAND Asynchronous Mode Configuration.....	843
21.7.4.3	Samsung OneNAND Synchronous Mode Configuration.....	843
21.7.4.4	Samsung OneNAND Utility.....	843
21.7.5	Access to Samsung UtRAM .....	844
21.7.5.1	Samsung UtRAM Asynchronous Mode Configuration.....	844
21.7.5.2	Samsung UtRAM Synchronous Mode Configuration.....	844
21.7.6	Access to Spansion Flash .....	844

<b>Section number</b>	<b>Title</b>	<b>Page</b>
21.7.6.1	Spansion Flash Asynchronous Mode Configuration.....	844
21.7.6.2	Spansion Flash Synchronous Mode Configuration.....	845
21.7.6.3	Spansion Flash Utility.....	845
21.7.7	8 bit support.....	846
21.8	External Bus Timing Diagrams.....	847
21.8.1	Asynchronous Read Memory Accesses Timing Diagram.....	847
21.8.2	Asynchronous Write Memory Accesses Timing Diagram.....	848
21.8.3	Asynchronous Read/Write Memory Accesses Timing Diagram.....	849
21.8.4	Asynchronous Read/Write Using RAL, WAL and CSREC.....	851
21.8.5	Consecutive Asynchronous Write Memory Accesses Timing Diagram.....	852
21.8.6	Consecutive Asynchronous Read Memory Accesses Timing Diagram.....	855
21.8.7	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0.....	857
21.8.8	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1.....	858
21.8.9	Burst (Synchronous Mode) Write Memory Access Timing - BCD=1.....	859
21.8.10	Asynchronous Page Mode Access.....	861
21.8.11	DTACK Mode - AXI Single Access.....	861
21.8.12	DTACK Mode - AXI Single Write Access.....	864
21.8.13	DTACK Mode - AXI Burst Access.....	865
21.9	EIM Memory Map/Register Definition.....	866
21.9.1	Chip Select n General Configuration Register 1 (EIM_CSnGCR1).....	869
21.9.2	Chip Select n General Configuration Register 2 (EIM_CSnGCR2).....	873
21.9.3	Chip Select n Read Configuration Register 1 (EIM_CSnRCR1).....	875
21.9.4	Chip Select n Read Configuration Register 2 (EIM_CSnRCR2).....	877
21.9.5	Chip Select n Write Configuration Register 1 (EIM_CSnWCR1).....	879
21.9.6	Chip Select n Write Configuration Register 2 (EIM_CSnWCR2).....	882
21.9.7	EIM Configuration Register (EIM_WCR).....	883

## Chapter 22 10/100-Mbps Ethernet MAC (ENET)

22.1	Introduction.....	885
------	-------------------	-----

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.2	Overview.....	885
22.2.1	Features.....	886
22.2.1.1	Ethernet MAC features.....	886
22.2.1.2	IP protocol performance optimization features.....	887
22.2.1.3	IEEE 1588 features.....	888
22.2.2	Block diagram.....	888
22.3	External Signals.....	889
22.4	Clocks.....	898
22.5	Memory map/register definition.....	899
22.5.1	Interrupt Event Register (ENETx_EIR).....	908
22.5.2	Interrupt Mask Register (ENETx_EIMR).....	911
22.5.3	Receive Descriptor Active Register (ENETx_RDAR).....	914
22.5.4	Transmit Descriptor Active Register (ENETx_TDAR).....	915
22.5.5	Ethernet Control Register (ENETx_ECR).....	916
22.5.6	MII Management Frame Register (ENETx_MMFR).....	918
22.5.7	MII Speed Control Register (ENETx_MSCR).....	918
22.5.8	MIB Control Register (ENETx_MIBC).....	921
22.5.9	Receive Control Register (ENETx_RCR).....	922
22.5.10	Transmit Control Register (ENETx_TCR).....	925
22.5.11	Physical Address Lower Register (ENETx_PALR).....	927
22.5.12	Physical Address Upper Register (ENETx_PAUR).....	927
22.5.13	Opcode/Pause Duration Register (ENETx_OPD).....	928
22.5.14	Transmit Interrupt Coalescing Register (ENETx_TXIC).....	928
22.5.15	Receive Interrupt Coalescing Register (ENETx_RXIC).....	929
22.5.16	Descriptor Individual Upper Address Register (ENETx_IAUR).....	930
22.5.17	Descriptor Individual Lower Address Register (ENETx_IALR).....	931
22.5.18	Descriptor Group Upper Address Register (ENETx_GAUR).....	931
22.5.19	Descriptor Group Lower Address Register (ENETx_GALR).....	932
22.5.20	Transmit FIFO Watermark Register (ENETx_TFWR).....	932

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.5.21	Receive Descriptor Ring Start Register (ENET <sub>x</sub> _RDSR).....	933
22.5.22	Transmit Buffer Descriptor Ring Start Register (ENET <sub>x</sub> _TDSR).....	934
22.5.23	Maximum Receive Buffer Size Register (ENET <sub>x</sub> _MRBR).....	935
22.5.24	Receive FIFO Section Full Threshold (ENET <sub>x</sub> _RSFL).....	936
22.5.25	Receive FIFO Section Empty Threshold (ENET <sub>x</sub> _RSEM).....	936
22.5.26	Receive FIFO Almost Empty Threshold (ENET <sub>x</sub> _RAEM).....	937
22.5.27	Receive FIFO Almost Full Threshold (ENET <sub>x</sub> _RAFL).....	937
22.5.28	Transmit FIFO Section Empty Threshold (ENET <sub>x</sub> _TSEM).....	938
22.5.29	Transmit FIFO Almost Empty Threshold (ENET <sub>x</sub> _TAEM).....	938
22.5.30	Transmit FIFO Almost Full Threshold (ENET <sub>x</sub> _TAFL).....	939
22.5.31	Transmit Inter-Packet Gap (ENET <sub>x</sub> _TIPG).....	939
22.5.32	Frame Truncation Length (ENET <sub>x</sub> _FTRL).....	940
22.5.33	Transmit Accelerator Function Configuration (ENET <sub>x</sub> _TACC).....	940
22.5.34	Receive Accelerator Function Configuration (ENET <sub>x</sub> _RACC).....	941
22.5.35	Reserved Statistic Register (ENET <sub>x</sub> _RMON_T_DROP).....	942
22.5.36	Tx Packet Count Statistic Register (ENET <sub>x</sub> _RMON_T_PACKETS).....	943
22.5.37	Tx Broadcast Packets Statistic Register (ENET <sub>x</sub> _RMON_T_BC_PKT).....	943
22.5.38	Tx Multicast Packets Statistic Register (ENET <sub>x</sub> _RMON_T_MC_PKT).....	944
22.5.39	Tx Packets with CRC/Align Error Statistic Register (ENET <sub>x</sub> _RMON_T_CRC_ALIGN).....	944
22.5.40	Tx Packets Less Than Bytes and Good CRC Statistic Register (ENET <sub>x</sub> _RMON_T_UNDERSIZE).....	944
22.5.41	Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENET <sub>x</sub> _RMON_T_OVERSIZE)....	945
22.5.42	Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET <sub>x</sub> _RMON_T_FRAG).....	945
22.5.43	Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENET <sub>x</sub> _RMON_T_JAB)...946	946
22.5.44	Tx Collision Count Statistic Register (ENET <sub>x</sub> _RMON_T_COL).....	946
22.5.45	Tx 64-Byte Packets Statistic Register (ENET <sub>x</sub> _RMON_T_P64).....	947
22.5.46	Tx 65- to 127-byte Packets Statistic Register (ENET <sub>x</sub> _RMON_T_P65TO127).....	947
22.5.47	Tx 128- to 255-byte Packets Statistic Register (ENET <sub>x</sub> _RMON_T_P128TO255).....	948
22.5.48	Tx 256- to 511-byte Packets Statistic Register (ENET <sub>x</sub> _RMON_T_P256TO511).....	948
22.5.49	Tx 512- to 1023-byte Packets Statistic Register (ENET <sub>x</sub> _RMON_T_P512TO1023).....	949

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.5.50	Tx 1024- to 2047-byte Packets Statistic Register (ENETx_RMON_T_P1024TO2047).....	949
22.5.51	Tx Packets Greater Than 2048 Bytes Statistic Register (ENETx_RMON_T_P_GTE2048).....	950
22.5.52	Tx Octets Statistic Register (ENETx_RMON_T_OCTETS).....	950
22.5.53	Reserved Statistic Register (ENETx_IEEE_T_DROP).....	950
22.5.54	Frames Transmitted OK Statistic Register (ENETx_IEEE_T_FRAME_OK).....	951
22.5.55	Frames Transmitted with Single Collision Statistic Register (ENETx_IEEE_T_1COL).....	951
22.5.56	Frames Transmitted with Multiple Collisions Statistic Register (ENETx_IEEE_T_MCOL).....	952
22.5.57	Frames Transmitted after Deferral Delay Statistic Register (ENETx_IEEE_T_DEF).....	952
22.5.58	Frames Transmitted with Late Collision Statistic Register (ENETx_IEEE_T_LCOL).....	952
22.5.59	Frames Transmitted with Excessive Collisions Statistic Register (ENETx_IEEE_T_EXCOL).....	953
22.5.60	Frames Transmitted with Tx FIFO Underrun Statistic Register (ENETx_IEEE_T_MACERR).....	953
22.5.61	Frames Transmitted with Carrier Sense Error Statistic Register (ENETx_IEEE_T_CSERR).....	954
22.5.62	Reserved Statistic Register (ENETx_IEEE_T_SQE).....	954
22.5.63	Flow Control Pause Frames Transmitted Statistic Register (ENETx_IEEE_T_FDXFC).....	954
22.5.64	Octet Count for Frames Transmitted w/o Error Statistic Register (ENETx_IEEE_T_OCTETS_OK)....	955
22.5.65	Rx Packet Count Statistic Register (ENETx_RMON_R_PACKETS).....	955
22.5.66	Rx Broadcast Packets Statistic Register (ENETx_RMON_R_BC_PKT).....	956
22.5.67	Rx Multicast Packets Statistic Register (ENETx_RMON_R_MC_PKT).....	956
22.5.68	Rx Packets with CRC/Align Error Statistic Register (ENETx_RMON_R_CRC_ALIGN).....	956
22.5.69	Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENETx_RMON_R_UNDERSIZE).....	957
22.5.70	Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENETx_RMON_R_OVERSIZE).....	957
22.5.71	Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_R_FRAG).....	958
22.5.72	Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENETx_RMON_R_JAB).....	958
22.5.73	Reserved Statistic Register (ENETx_RMON_R_RESVD_0).....	958
22.5.74	Rx 64-Byte Packets Statistic Register (ENETx_RMON_R_P64).....	959
22.5.75	Rx 65- to 127-Byte Packets Statistic Register (ENETx_RMON_R_P65TO127).....	959
22.5.76	Rx 128- to 255-Byte Packets Statistic Register (ENETx_RMON_R_P128TO255).....	960

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.5.77	Rx 256- to 511-Byte Packets Statistic Register (ENET <sub>x</sub> _RMON_R_P256TO511).....	960
22.5.78	Rx 512- to 1023-Byte Packets Statistic Register (ENET <sub>x</sub> _RMON_R_P512TO1023).....	960
22.5.79	Rx 1024- to 2047-Byte Packets Statistic Register (ENET <sub>x</sub> _RMON_R_P1024TO2047).....	961
22.5.80	Rx Packets Greater than 2048 Bytes Statistic Register (ENET <sub>x</sub> _RMON_R_P_GTE2048).....	961
22.5.81	Rx Octets Statistic Register (ENET <sub>x</sub> _RMON_R_OCTETS).....	962
22.5.82	Frames not Counted Correctly Statistic Register (ENET <sub>x</sub> _IEEE_R_DROP).....	962
22.5.83	Frames Received OK Statistic Register (ENET <sub>x</sub> _IEEE_R_FRAME_OK).....	962
22.5.84	Frames Received with CRC Error Statistic Register (ENET <sub>x</sub> _IEEE_R_CRC).....	963
22.5.85	Frames Received with Alignment Error Statistic Register (ENET <sub>x</sub> _IEEE_R_ALIGN).....	963
22.5.86	Receive FIFO Overflow Count Statistic Register (ENET <sub>x</sub> _IEEE_R_MACERR).....	964
22.5.87	Flow Control Pause Frames Received Statistic Register (ENET <sub>x</sub> _IEEE_R_FDXFC).....	964
22.5.88	Octet Count for Frames Received without Error Statistic Register (ENET <sub>x</sub> _IEEE_R_OCTETS_OK)...	964
22.5.89	Adjustable Timer Control Register (ENET <sub>x</sub> _ATCR).....	965
22.5.90	Timer Value Register (ENET <sub>x</sub> _ATVR).....	967
22.5.91	Timer Offset Register (ENET <sub>x</sub> _ATOFF).....	967
22.5.92	Timer Period Register (ENET <sub>x</sub> _ATPER).....	967
22.5.93	Timer Correction Register (ENET <sub>x</sub> _ATCOR).....	968
22.5.94	Time-Stamping Clock Period Register (ENET <sub>x</sub> _ATINC).....	969
22.5.95	Timestamp of Last Transmitted Frame (ENET <sub>x</sub> _ATSTMP).....	969
22.5.96	Timer Global Status Register (ENET <sub>x</sub> _TGSR).....	970
22.5.97	Timer Control Status Register (ENET <sub>x</sub> _TCSR <sub>n</sub> ).....	971
22.5.98	Timer Compare Capture Register (ENET <sub>x</sub> _TCCR <sub>n</sub> ).....	972
22.6	Functional description.....	973
22.6.1	Ethernet MAC frame formats.....	973
22.6.1.1	Pause Frames.....	975
22.6.1.2	Magic packets.....	975
22.6.2	IP and higher layers frame format.....	976
22.6.2.1	Ethernet types.....	976
22.6.2.2	IPv4 datagram format.....	976

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.6.2.3	IPv6 datagram format.....	977
22.6.2.4	Internet Control Message Protocol (ICMP) datagram format.....	978
22.6.2.5	User Datagram Protocol (UDP) datagram format.....	979
22.6.2.6	TCP datagram format.....	979
22.6.3	IEEE 1588 message formats.....	980
22.6.3.1	Transport encapsulation.....	980
22.6.3.1.1	UDP/IP.....	980
22.6.3.1.2	Native Ethernet (PTPv2).....	981
22.6.3.2	PTP header.....	981
22.6.3.2.1	PTPv1 header.....	982
22.6.3.2.2	PTPv2 header.....	982
22.6.4	MAC receive.....	984
22.6.4.1	Collision detection in half-duplex mode.....	985
22.6.4.2	Preamble processing.....	985
22.6.4.3	MAC address check.....	986
22.6.4.3.1	Unicast address check.....	986
22.6.4.3.2	Multicast and unicast address resolution.....	986
22.6.4.3.3	Broadcast address reject.....	987
22.6.4.3.4	Miss-bit implementation.....	987
22.6.4.4	Frame length/type verification: payload length check.....	988
22.6.4.5	Frame length/type verification: frame length check.....	988
22.6.4.6	VLAN frames processing.....	988
22.6.4.7	Pause frame termination.....	988
22.6.4.8	CRC check.....	989
22.6.4.9	Frame padding removal.....	989
22.6.5	MAC transmit.....	990
22.6.5.1	Frame payload padding.....	991
22.6.5.2	MAC address insertion.....	991
22.6.5.3	CRC-32 generation.....	991

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.6.5.4	Inter-packet gap (IPG).....	992
22.6.5.5	Collision detection and handling — half-duplex operation only.....	992
22.6.6	Full-duplex flow control operation.....	994
22.6.6.1	Remote device congestion.....	994
22.6.6.2	Local device/FIFO congestion.....	995
22.6.7	Magic packet detection.....	996
22.6.7.1	Sleep mode.....	996
22.6.7.2	Magic packet detection.....	996
22.6.7.3	Wakeup.....	996
22.6.8	IP accelerator functions.....	997
22.6.8.1	Checksum calculation.....	997
22.6.8.2	Additional padding processing.....	998
22.6.8.3	32-bit Ethernet payload alignment.....	998
22.6.8.3.1	Receive processing.....	999
22.6.8.3.2	Transmit processing.....	999
22.6.8.4	Received frame discard.....	999
22.6.8.5	IPv4 fragments.....	1000
22.6.8.6	IPv6 support.....	1000
22.6.8.6.1	Receive processing.....	1000
22.6.8.6.2	Transmit processing.....	1001
22.6.9	Resets and stop controls.....	1001
22.6.9.1	Hardware reset.....	1001
22.6.9.2	Soft reset.....	1001
22.6.9.3	Hardware freeze.....	1002
22.6.9.4	Graceful stop.....	1002
22.6.9.4.1	Graceful transmit stop (GTS).....	1003
22.6.9.4.2	Graceful receive stop (GRS).....	1003
22.6.9.4.3	Graceful stop interrupt (GRA).....	1004
22.6.10	IEEE 1588 functions.....	1004

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.6.10.1	Adjustable timer module.....	1005
22.6.10.1.1	Adjustable timer implementation.....	1005
22.6.10.2	Transmit timestamping.....	1007
22.6.10.3	Receive timestamping.....	1007
22.6.10.4	Time synchronization.....	1007
22.6.10.5	Input Capture and Output Compare.....	1008
22.6.10.5.1	Input capture.....	1008
22.6.10.5.2	Output compare.....	1008
22.6.10.5.3	DMA requests.....	1008
22.6.11	FIFO thresholds.....	1008
22.6.11.1	Receive FIFO.....	1009
22.6.11.2	Transmit FIFO.....	1010
22.6.12	Loopback options.....	1011
22.6.13	Legacy buffer descriptors.....	1012
22.6.13.1	Legacy receive buffer descriptor.....	1012
22.6.13.2	Legacy transmit buffer descriptor.....	1012
22.6.14	Enhanced buffer descriptors.....	1013
22.6.14.1	Enhanced receive buffer descriptor.....	1013
22.6.14.2	Enhanced transmit buffer descriptor.....	1017
22.6.15	Client FIFO application interface.....	1019
22.6.15.1	Data structure description.....	1020
22.6.15.2	Data structure examples.....	1021
22.6.15.3	Frame status.....	1022
22.6.16	FIFO protection.....	1022
22.6.16.1	Transmit FIFO underflow.....	1023
22.6.16.2	Transmit FIFO overflow.....	1023
22.6.16.3	Receive FIFO overflow.....	1024
22.6.17	PHY management interface.....	1025
22.6.17.1	MDIO clause 22 frame format.....	1025

<b>Section number</b>	<b>Title</b>	<b>Page</b>
22.6.17.2	MDIO clause 45 frame format.....	1026
22.6.17.3	MDIO clock generation.....	1027
22.6.17.4	MDIO operation.....	1027
22.6.18	Ethernet interfaces.....	1028
22.6.18.1	RMII interface.....	1028
22.6.18.2	MII Interface — transmit.....	1029
	22.6.18.2.1    Transmit with collision — half-duplex.....	1030
22.6.18.3	MII interface — receive.....	1031
22.6.19	Interrupt coalescence.....	1032
22.6.19.1	Interrupt coalescence setup.....	1032
22.6.19.2	Updating the frame count threshold on-the-fly.....	1033
22.6.19.3	Updating the timer threshold on-the-fly.....	1033

## **Chapter 23** **Electrophoretic Display Controller (EPDC)**

23.1	Overview .....	1035
23.1.1	EPDC Block Diagram.....	1036
23.2	External Signals.....	1037
23.3	Programming Model.....	1037
23.3.1	Assumptions.....	1037
23.3.2	Register Space (Write/Set/Clear/Toggle).....	1038
23.3.3	Interrupts.....	1039
23.3.3.1	Interrupt Sources.....	1039
23.3.3.2	Enabling/Masking Interrupts.....	1039
23.3.3.3	Handling/Clearing Interrupts.....	1039
23.3.4	Controller Setup.....	1040
23.3.4.1	Memory Requirements.....	1040
23.3.4.2	Panel Architecture Configuration.....	1041
23.3.4.3	TFT Panel Timing Configuration .....	1043
23.3.4.4	Source Driver and Pixel Clock Configuration.....	1049

<b>Section number</b>	<b>Title</b>	<b>Page</b>
23.3.4.5	Initializing the Display.....	1050
23.3.4.5.1	Reset/Clocks and Buffer Preparation.....	1050
23.3.4.5.2	Performing an Initialization Display Update.....	1051
23.3.5	Update Buffer Analysis Functions.....	1051
23.3.6	Waveform Mode Selection (AUTOWV).....	1052
23.3.7	Panel Interface Generator (Pigeon Mode).....	1053
23.3.8	Display Update Programming.....	1057
23.3.8.1	Initiating a Display Update.....	1057
23.3.8.2	Update Processing and Collisions.....	1058
23.3.8.3	Multiple Update Flow.....	1062
23.3.9	Architectural Clock Gating (Low Power Mode).....	1065
23.3.10	Performance Tuning and Considerations.....	1067
23.3.10.1	Memory and Bus Bandwidth Requirements.....	1067
23.3.10.2	Pixel Latency FIFO.....	1068
23.3.10.3	Basic Watermarking Control.....	1068
23.3.10.4	Update/Refresh Tuning (VSCAN_HOLDOFF).....	1069
23.3.10.5	System-Level Arbitration Control.....	1069
23.4	EPDC Memory Map/Register Definition.....	1071
23.4.1	EPDC Control Register (EPDC_CTRL $n$ ).....	1080
23.4.2	EPDC Working Buffer Address for TCE (EPDC_WB_ADDR_TCE).....	1082
23.4.3	EPDC Waveform Address Pointer (EPDC_WVADDR).....	1082
23.4.4	EPDC Working Buffer Address (EPDC_WB_ADDR).....	1083
23.4.5	EPDC Screen Resolution (EPDC_RES).....	1083
23.4.6	EPDC Format Control Register (EPDC_FORMAT $n$ ).....	1084
23.4.7	Working Buffer Field Setting (EPDC_WB_FIELD0).....	1086
23.4.8	Working Buffer Field Setting (EPDC_WB_FIELD1).....	1087
23.4.9	Working Buffer Field Setting (EPDC_WB_FIELD2).....	1088
23.4.10	Working Buffer Field Setting (EPDC_WB_FIELD3).....	1089
23.4.11	EPDC FIFO control register (EPDC_FIFOCTRL $n$ ).....	1089

<b>Section number</b>	<b>Title</b>	<b>Page</b>
23.4.12	EPDC Update Region Address (EPDC_UPD_ADDR).....	1090
23.4.13	EPDC Update Region Stride (EPDC_UPD_STRIDE).....	1091
23.4.14	EPDC Update Command Co-ordinate (EPDC_UPD_CORD).....	1092
23.4.15	EPDC Update Command Size (EPDC_UPD_SIZE).....	1092
23.4.16	EPDC Update Command Control (EPDC_UPD_CTRL $n$ ).....	1093
23.4.17	EPDC Update Fixed Pixel Control (EPDC_UPD_FIXED $n$ ).....	1094
23.4.18	EPDC Temperature Register (EPDC_TEMP).....	1095
23.4.19	Waveform Mode Lookup Table Control Register. (EPDC_AUTOWV_LUT).....	1095
23.4.20	EPDC LUT Standby Register for LUT 31~0 (EPDC_LUT_STANDBY1 $n$ ).....	1096
23.4.21	EPDC LUT Standby Register for LUT 63~32 (EPDC_LUT_STANDBY2 $n$ ).....	1096
23.4.22	EPDC Timing Control Engine Control Register (EPDC_TCE_CTRL $n$ ).....	1096
23.4.23	EPDC Timing Control Engine Source-Driver Config Register (EPDC_TCE_SD CFG $n$ ).....	1099
23.4.24	EPDC Timing Control Engine Gate-Driver Config Register (EPDC_TCE_GD CFG $n$ ).....	1100
23.4.25	EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC_TCE_HSCAN1 $n$ ).....	1101
23.4.26	EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC_TCE_HSCAN2 $n$ ).....	1101
23.4.27	EPDC Timing Control Engine Vertical Timing Register (EPDC_TCE_VSCAN $n$ ).....	1102
23.4.28	EPDC Timing Control Engine OE timing control Register (EPDC_TCE_OE $n$ ).....	1102
23.4.29	EPDC Timing Control Engine Driver Polarity Register (EPDC_TCE_POLARITY $n$ ).....	1103
23.4.30	EPDC Timing Control Engine Timing Register 1 (EPDC_TCE_TIMING1 $n$ ).....	1104
23.4.31	EPDC Timing Control Engine Timing Register 2 (EPDC_TCE_TIMING2 $n$ ).....	1105
23.4.32	EPDC Timing Control Engine Timing Register 3 (EPDC_TCE_TIMING3 $n$ ).....	1106
23.4.33	EPDC Pigeon Mode Control Register 0 (EPDC_PIGEON_CTRL0 $n$ ).....	1106
23.4.34	EPDC Pigeon Mode Control Register 1 (EPDC_PIGEON_CTRL1 $n$ ).....	1107
23.4.35	EPDC IRQ Mask Register for LUT 0~31 (EPDC_IRQ_MASK1 $n$ ).....	1107
23.4.36	EPDC IRQ Mask Register for LUT 32~63 (EPDC_IRQ_MASK2 $n$ ).....	1108
23.4.37	EPDC Interrupt Register for LUT 0~31 (EPDC_IRQ1 $n$ ).....	1108
23.4.38	EPDC Interrupt Register for LUT 32~63 (EPDC_IRQ2 $n$ ).....	1108
23.4.39	EPDC IRQ Mask Register (EPDC_IRQ_MASK $n$ ).....	1109
23.4.40	EPDC Interrupt Register (EPDC_IRQ $n$ ).....	1110

<b>Section number</b>	<b>Title</b>	<b>Page</b>
23.4.41	EPDC Status Register - LUTs (EPDC_STATUS_LUTS1 $n$ ).....	1111
23.4.42	EPDC Status Register - LUTs (EPDC_STATUS_LUTS2 $n$ ).....	1112
23.4.43	EPDC Status Register - Next Available LUT (EPDC_STATUS_NEXTLUT).....	1112
23.4.44	EPDC LUT Collision Status (EPDC_STATUS_COL1 $n$ ).....	1114
23.4.45	EPDC LUT Collision Status (EPDC_STATUS_COL2 $n$ ).....	1114
23.4.46	EPDC General Status Register (EPDC_STATUS $n$ ).....	1115
23.4.47	EPDC Collision Region Co-ordinate (EPDC_UPD_COL_CORD).....	1116
23.4.48	EPDC Collision Region Size (EPDC_UPD_COL_SIZE).....	1117
23.4.49	1-level Histogram Parameter Register. (EPDC_HIST1_PARAM).....	1117
23.4.50	2-level Histogram Parameter Register. (EPDC_HIST2_PARAM).....	1118
23.4.51	4-level Histogram Parameter Register. (EPDC_HIST4_PARAM).....	1119
23.4.52	8-level Histogram Parameter 0 Register. (EPDC_HIST8_PARAM0).....	1119
23.4.53	8-level Histogram Parameter 1 Register. (EPDC_HIST8_PARAM1).....	1120
23.4.54	16-level Histogram Parameter 0 Register. (EPDC_HIST16_PARAM0).....	1121
23.4.55	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM1).....	1122
23.4.56	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM2).....	1122
23.4.57	16-level Histogram Parameter Register. (EPDC_HIST16_PARAM3).....	1123
23.4.58	EPDC General Purpose I/O Debug register (EPDC_GPIO $n$ ).....	1124
23.4.59	EPDC Version Register (EPDC_VERSION).....	1125
23.4.60	Panel Interface Signal Generator Register 0_0 (EPDC_PIGEON_0_0).....	1126

23.4.101	Panel Interface Signal Generator Register 13_1 (EPDC_PIGEON_13_2).....	1158
23.4.102	Panel Interface Signal Generator Register 14_0 (EPDC_PIGEON_14_0).....	1158
23.4.103	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_1).....	1160
23.4.104	Panel Interface Signal Generator Register 14_1 (EPDC_PIGEON_14_2).....	1160
23.4.105	Panel Interface Signal Generator Register 15_0 (EPDC_PIGEON_15_0).....	1161
23.4.106	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_1).....	1162
23.4.107	Panel Interface Signal Generator Register 15_1 (EPDC_PIGEON_15_2).....	1162
23.4.108	Panel Interface Signal Generator Register 16_0 (EPDC_PIGEON_16_0).....	1163
23.4.109	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_1).....	1164
23.4.110	Panel Interface Signal Generator Register 16_1 (EPDC_PIGEON_16_2).....	1165

## **Chapter 24** **Enhanced Periodic Interrupt Timer (EPIT)**

24.1	Overview.....	1167
24.1.1	EPIT features.....	1167
24.1.2	EPIT modes and operations.....	1168
24.2	External signals.....	1168
24.3	Clocks.....	1168
24.4	Functional Description.....	1170
24.4.1	Operating modes.....	1170
24.4.1.1	Operating in set-and-forget mode.....	1170
24.4.1.2	Operating in free-running mode.....	1170
24.4.2	Operations.....	1171
24.4.3	Compare Event.....	1171
24.4.3.1	Counter Value Overwrite.....	1172
24.4.3.2	Low-Power Mode Behavior.....	1173
24.4.3.3	Debug Mode Behavior.....	1173
24.5	Initialization/ Application Information.....	1173

<b>Section number</b>	<b>Title</b>	<b>Page</b>
24.5.1	Change of Clock Source.....	1173
24.6	EPIT Memory Map/Register Definition.....	1174
24.6.1	Control register (EPIT <sub>x</sub> _CR).....	1174
24.6.2	Status register (EPIT <sub>x</sub> _SR).....	1177
24.6.3	Load register (EPIT <sub>x</sub> _LR).....	1177
24.6.4	Compare register (EPIT <sub>x</sub> _CMPR).....	1178
24.6.5	Counter register (EPIT <sub>x</sub> _CNR).....	1178
<b>Chapter 25</b>		
<b>Enhanced Serial Audio Interface (ESAI)</b>		
25.1	Overview.....	1179
25.1.1	Features.....	1181
25.1.2	Modes of Operation.....	1181
25.1.2.1	Normal/Network/On-Demand Mode Selection.....	1181
25.1.2.2	Synchronous/Asynchronous Operating Modes.....	1182
25.1.2.3	Frame Sync Selection.....	1182
25.1.2.4	Shift Direction Selection.....	1183
25.2	External Signals.....	1184
25.2.1	Serial Transmit 0 Data Pin.....	1184
25.2.2	Serial Transmit 1 Data Pin.....	1184
25.2.3	Serial Transmit 2/Receive 3 Data Pin.....	1184
25.2.4	Serial Transmit 3/Receive 2 Data Pin.....	1185
25.2.5	Serial Transmit 4/Receive 1 Data Pin.....	1185
25.2.6	Serial Transmit 5/Receive 0 Data Pin.....	1186
25.2.7	Receiver Serial Clock.....	1186
25.2.8	Transmitter Serial Clock.....	1188
25.2.9	Frame Sync for Receiver.....	1189
25.2.10	Frame Sync for Transmitter.....	1190
25.2.11	High Frequency Clock for Transmitter.....	1190
25.2.12	High Frequency Clock for Receiver.....	1190

<b>Section number</b>	<b>Title</b>	<b>Page</b>
25.2.13	Serial I/O Flags.....	1191
25.3	Clocks.....	1192
25.4	Functional Description.....	1192
25.4.1	ESAI After Reset.....	1192
25.4.2	ESAI Interrupt Requests.....	1193
25.4.3	ESAI DMA Requests from the FIFOs.....	1194
25.4.4	ESAI Transmit and Receive Shift Registers.....	1194
	25.4.4.1    ESAI Transmit Shift Registers.....	1195
	25.4.4.2    ESAI Receive Shift Registers.....	1198
25.5	Initialization Information.....	1198
25.5.1	ESAI Initialization.....	1198
25.5.2	ESAI Initialization Examples.....	1199
	25.5.2.1    Initializing the ESAI using Personal Reset.....	1199
	25.5.2.2    Initializing the ESAI Transmitter Section.....	1200
	25.5.2.3    Initializing the ESAI Receiver Section.....	1200
25.6	ESAI Memory Map/Register Definition.....	1201
25.6.1	ESAI Transmit Data Register (ESAI_ETDR).....	1203
25.6.2	ESAI Receive Data Register (ESAI_ERDR).....	1203
25.6.3	ESAI Control Register (ESAI_ECR).....	1204
25.6.4	ESAI Status Register (ESAI_ESR).....	1205
25.6.5	Transmit FIFO Configuration Register (ESAI_TFCR).....	1206
25.6.6	Transmit FIFO Status Register (ESAI_TFSR).....	1208
25.6.7	Receive FIFO Configuration Register (ESAI RFCR).....	1209
25.6.8	Receive FIFO Status Register (ESAI_RFSR).....	1211
25.6.9	Transmit Data Register n (ESAI_TXn).....	1212
25.6.10	ESAI Transmit Slot Register (ESAI_TSR).....	1212
25.6.11	Receive Data Register n (ESAI_RXn).....	1213
25.6.12	Serial Audio Interface Status Register (ESAI_SAISR).....	1214
25.6.13	Serial Audio Interface Control Register (ESAI_SAICR).....	1216

<b>Section number</b>	<b>Title</b>	<b>Page</b>
25.6.14	Transmit Control Register (ESAI_TCR).....	1219
25.6.15	Transmit Clock Control Register (ESAI_TCCR).....	1227
25.6.16	Receive Control Register (ESAI_RCR).....	1231
25.6.17	Receive Clock Control Register (ESAI_RCCR).....	1235
25.6.18	Transmit Slot Mask Register A (ESAI_TSMA).....	1238
25.6.19	Transmit Slot Mask Register B (ESAI_TSMB).....	1239
25.6.20	Receive Slot Mask Register A (ESAI_RSMA).....	1240
25.6.21	Receive Slot Mask Register B (ESAI_RSMB).....	1241
25.6.22	Port C Direction Register (ESAI_PRRC).....	1242
25.6.23	Port C Control Register (ESAI_PCRC).....	1242

## Chapter 26 Flexible Controller Area Network (FLEXCAN)

26.1	Overview.....	1245
26.1.1	Block Diagram.....	1245
26.1.2	FLEXCAN Module Features.....	1247
26.1.3	Modes of Operation.....	1248
26.2	External Signals.....	1249
26.3	Clocks.....	1250
26.4	Message Buffer Structure.....	1250
26.5	Rx FIFO Structure.....	1254
26.6	Functional Description.....	1258
26.6.1	Functional Overview.....	1258
26.6.2	Transmit Process.....	1258
26.6.3	Arbitration process.....	1259
26.6.3.1	Lowest Mailbox number first.....	1260
26.6.3.2	Highest Mailbox priority first.....	1260
26.6.3.2.1	Local Priority disabled.....	1260
26.6.3.2.2	Local Priority enabled.....	1261
26.6.4	Receive Process.....	1262

<b>Section number</b>	<b>Title</b>	<b>Page</b>
26.6.5	Matching Process.....	1264
26.6.6	Move Process.....	1268
26.6.6.1	Move-in.....	1269
26.6.6.2	Move-out.....	1270
26.6.7	Data Coherence.....	1270
26.6.7.1	Transmission Abort Mechanism.....	1270
26.6.7.2	Message Buffer Inactivation.....	1271
26.6.7.3	Message Buffer Lock Mechanism.....	1272
26.6.8	Rx FIFO.....	1273
26.6.9	CAN Protocol Related Features.....	1275
26.6.9.1	Remote Frames.....	1275
26.6.9.2	Overload Frames.....	1276
26.6.9.3	Time Stamp.....	1276
26.6.9.4	Protocol Timing.....	1276
26.6.9.5	Arbitration and Matching Timing.....	1279
26.6.10	Modes of Operation Details.....	1281
26.6.10.1	Freeze Mode.....	1281
26.6.10.2	Module Disable Mode.....	1282
26.6.10.3	Stop Mode.....	1283
26.6.11	Interrupts.....	1284
26.7	Initialization/Application Information.....	1284
26.7.1	FLEXCAN Initialization Sequence.....	1285
26.8	FLEXCAN Memory Map/Register Definition.....	1286
26.8.1	Module Configuration Register (FLEXCAN $x$ _MCR).....	1293
26.8.2	Control 1 Register (FLEXCAN $x$ _CTRL1).....	1298
26.8.3	Free Running Timer Register (FLEXCAN $x$ _TIMER).....	1301
26.8.4	Rx Mailboxes Global Mask Register (FLEXCAN $x$ _RXMGMASK).....	1301
26.8.5	Rx Buffer 14 Mask Register (FLEXCAN $x$ _RX14MASK).....	1302
26.8.6	Rx Buffer 15 Mask Register (FLEXCAN $x$ _RX15MASK).....	1303

<b>Section number</b>	<b>Title</b>	<b>Page</b>
26.8.7	Error Counter Register (FLEXCAN $x$ _ECR).....	1304
26.8.8	Error and Status 1 Register (FLEXCAN $x$ _ESR1).....	1305
26.8.9	Interrupt Masks 2 Register (FLEXCAN $x$ _IMASK2).....	1309
26.8.10	Interrupt Masks 1 Register (FLEXCAN $x$ _IMASK1).....	1309
26.8.11	Interrupt Flags 2 Register (FLEXCAN $x$ _IFLAG2).....	1310
26.8.12	Interrupt Flags 1 Register (FLEXCAN $x$ _IFLAG1).....	1310
26.8.13	Control 2 Register (FLEXCAN $x$ _CTRL2).....	1312
26.8.14	Error and Status 2 Register (FLEXCAN $x$ _ESR2).....	1318
26.8.15	CRC Register (FLEXCAN $x$ _CRCR).....	1320
26.8.16	Rx FIFO Global Mask Register (FLEXCAN $x$ _RXFGMASK).....	1321
26.8.17	Rx FIFO Information Register (FLEXCAN $x$ _RXFIR).....	1322
26.8.18	Rx Individual Mask Registers (FLEXCAN $x$ _RXIMR $n$ ).....	1323
26.8.19	Glitch Filter Width Registers (FLEXCAN $x$ _GFWR).....	1323

## **Chapter 27** **General Power Controller (GPC)**

27.1	Overview.....	1325
27.2	Clocks.....	1325
27.3	Power Gating Control (PGC).....	1325
27.3.1	Overview.....	1327
	27.3.1.1    Features.....	1328
27.4	GPC Interrupt Controller (INTC).....	1328
27.4.1	Interrupt Controller features.....	1328
27.5	GPC Memory Map/Register Definition.....	1329
27.5.1	GPC Interface control register (GPC_CNTR).....	1329
27.5.2	GPC Power Gating Register (GPC_PGR).....	1331
27.5.3	IRQ masking register 1 (GPC_IMR1).....	1332
27.5.4	IRQ masking register 2 (GPC_IMR2).....	1332
27.5.5	IRQ masking register 3 (GPC_IMR3).....	1332
27.5.6	IRQ masking register 4 (GPC_IMR4).....	1333

<b>Section number</b>	<b>Title</b>	<b>Page</b>
27.5.7	IRQ status resister 1 (GPC_ISR1).....	1333
27.5.8	IRQ status resister 2 (GPC_ISR2).....	1334
27.5.9	IRQ status resister 3 (GPC_ISR3).....	1334
27.5.10	IRQ status resister 4 (GPC_ISR4).....	1335
27.6	PGC Memory Map/Register Definition.....	1335
27.6.1	PGC Mega Control Register (PGC_MEGA_CTRL).....	1336
27.6.2	PGC Mega Power Up Sequence Control Register (PGC_MEGA_PUPSCR).....	1337
27.6.3	PGC Mega Pull Down Sequence Control Register (PGC_MEGA_PDNSCR).....	1337
27.6.4	PGC Mega Power Gating Controller Status Register (PGC_MEGA_SR).....	1338
27.6.5	PGC CPU Control Register (PGC_CPU_CTRL).....	1339
27.6.6	PGC CPU Power Up Sequence Control Register (PGC_CPU_PUPSCR).....	1339
27.6.7	PGC CPU Pull Down Sequence Control Register (PGC_CPU_PDNSCR).....	1340
27.6.8	PGC CPU Power Gating Controller Status Register (PGC_CPU_SR).....	1341

## Chapter 28 General Purpose Input/Output (GPIO)

28.1	Overview.....	1343
28.1.1	Block Diagram.....	1345
28.1.2	Features.....	1346
28.2	External Signals.....	1346
28.3	Clocks.....	1350
28.4	GPIO Functional Description.....	1350
28.4.1	GPIO Function.....	1351
28.4.2	GPIO pad structure.....	1351
28.4.2.1	Input Driver.....	1351
28.4.2.1.1	Schmitt trigger.....	1352
28.4.2.1.2	Input keeper.....	1353
28.4.2.2	Output Driver.....	1353
28.4.2.2.1	Drive strength.....	1353
28.4.2.2.2	Output keeper.....	1354

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	28.4.2.2.3 PU / PD / Keeper Logic.....	1354
	28.4.2.2.4 Open drain.....	1354
28.4.3	GPIO Programming.....	1355
	28.4.3.1 GPIO Read Mode.....	1355
	28.4.3.2 GPIO Write Mode.....	1356
28.4.4	Interrupt Control Unit.....	1356
28.5	GPIO Memory Map/Register Definition.....	1356
28.5.1	GPIO data register (GPIO <sub>x</sub> _DR).....	1358
28.5.2	GPIO direction register (GPIO <sub>x</sub> _GDIR).....	1359
28.5.3	GPIO pad status register (GPIO <sub>x</sub> _PSR).....	1359
28.5.4	GPIO interrupt configuration register1 (GPIO <sub>x</sub> _ICR1).....	1360
28.5.5	GPIO interrupt configuration register2 (GPIO <sub>x</sub> _ICR2).....	1364
28.5.6	GPIO interrupt mask register (GPIO <sub>x</sub> _IMR).....	1367
28.5.7	GPIO interrupt status register (GPIO <sub>x</sub> _ISR).....	1368
28.5.8	GPIO edge select register (GPIO <sub>x</sub> _EDGE_SEL).....	1369

## **Chapter 29** **General Purpose Media Interface (GPMI)**

29.1	Overview.....	1371
29.2	External Signals.....	1372
29.3	Clocks.....	1373
29.4	GPMI NAND Mode.....	1374
29.4.1	Multiple NAND Support.....	1374
29.4.2	GPMI NAND Timing and Clocking.....	1375
29.4.3	Basic NAND Timing.....	1375
29.4.3.1	NAND Asynchronous Timing.....	1375
29.4.3.2	NAND Asynchronous EDO Mode Timing.....	1377
29.4.3.3	NAND ONFI Source Synchronous Mode Timing.....	1380
29.4.3.4	NAND Toggle Mode Timing.....	1385
29.4.4	Hardware BCH Interface.....	1393

<b>Section number</b>	<b>Title</b>	<b>Page</b>
29.5	Behavior During Reset.....	1394
29.6	GPMI Memory Map/Register Definition.....	1394
29.6.1	GPMI Control Register 0 Description (GPMI_CTRL0 $n$ ).....	1396
29.6.2	GPMI Compare Register Description (GPMI_COMPARE).....	1398
29.6.3	GPMI Integrated ECC Control Register Description (GPMI_ECCCTRL $n$ ).....	1399
29.6.4	GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT).....	1400
29.6.5	GPMI Payload Address Register Description (GPMI_PAYLOAD).....	1400
29.6.6	GPMI Auxiliary Address Register Description (GPMI_AUXILIARY).....	1401
29.6.7	GPMI Control Register 1 Description (GPMI_CTRL1 $n$ ).....	1402
29.6.8	GPMI Timing Register 0 Description (GPMI_TIMING0).....	1404
29.6.9	GPMI Timing Register 1 Description (GPMI_TIMING1).....	1405
29.6.10	GPMI Timing Register 2 Description (GPMI_TIMING2).....	1406
29.6.11	GPMI DMA Data Transfer Register Description (GPMI_DATA).....	1407
29.6.12	GPMI Status Register Description (GPMI_STAT).....	1407
29.6.13	GPMI Debug Information Register Description (GPMI_DEBUG).....	1410
29.6.14	GPMI Version Register Description (GPMI_VERSION).....	1410
29.6.15	GPMI Debug2 Information Register Description (GPMI_DEBUG2).....	1411
29.6.16	GPMI Debug3 Information Register Description (GPMI_DEBUG3).....	1414
29.6.17	GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL).....	1414
29.6.18	GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL).....	1416
29.6.19	GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS).....	1418
29.6.20	GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS).....	1419

## Chapter 30 General Purpose Timer (GPT)

30.1	Overview.....	1421
30.1.1	Features.....	1423
30.1.2	Modes and Operation.....	1423
30.2	External Signals.....	1423
30.2.1	External Clock Input .....	1425

<b>Section number</b>	<b>Title</b>	<b>Page</b>
30.2.2	Input Capture Trigger Signals .....	1425
30.2.3	Output Compare Signals.....	1425
30.3	Clocks.....	1425
30.4	Functional Description.....	1427
30.4.1	Operating Modes.....	1427
30.4.1.1	Restart Mode.....	1427
30.4.1.2	Free-Run Mode.....	1428
30.4.2	Operation.....	1428
30.4.2.1	Input Capture.....	1429
30.4.2.2	Output Compare.....	1430
30.4.2.3	Interrupts.....	1430
30.4.2.4	Low Power Mode Behavior.....	1431
30.4.2.5	Debug Mode Behavior.....	1431
30.5	Initialization/ Application Information .....	1432
30.5.1	Selecting the Clock Source .....	1432
30.6	GPT Memory Map/Register Definition.....	1432
30.6.1	GPT Control Register (GPT <sub>x</sub> _CR).....	1434
30.6.2	GPT Prescaler Register (GPT <sub>x</sub> _PR).....	1438
30.6.3	GPT Status Register (GPT <sub>x</sub> _SR).....	1439
30.6.4	GPT Interrupt Register (GPT <sub>x</sub> _IR).....	1440
30.6.5	GPT Output Compare Register 1 (GPT <sub>x</sub> _OCR1).....	1441
30.6.6	GPT Output Compare Register 2 (GPT <sub>x</sub> _OCR2).....	1442
30.6.7	GPT Output Compare Register 3 (GPT <sub>x</sub> _OCR3).....	1442
30.6.8	GPT Input Capture Register 1 (GPT <sub>x</sub> _ICR1).....	1443
30.6.9	GPT Input Capture Register 2 (GPT <sub>x</sub> _ICR2).....	1443
30.6.10	GPT Counter Register (GPT <sub>x</sub> _CNT).....	1444
31.1	Overview.....	1445

## Chapter 31 I2C Controller (I2C)

31.1	Overview.....	1445
------	---------------	------

<b>Section number</b>	<b>Title</b>	<b>Page</b>
31.1.1	Features.....	1447
31.1.2	Modes and operations.....	1448
31.2	External Signals.....	1448
31.3	Clocks.....	1449
31.4	Functional description.....	1449
31.4.1	I2C system configuration.....	1450
31.4.2	Arbitration procedure.....	1450
31.4.3	Clock synchronization.....	1450
31.4.4	Handshaking.....	1451
31.4.5	Clock stretching.....	1451
31.4.6	Peripheral bus accesses.....	1452
31.4.7	Generation of transfer error on IP bus.....	1452
31.4.8	Reset.....	1452
31.4.9	Interrupts.....	1452
31.4.10	Byte order.....	1452
31.5	Initialization.....	1453
31.5.1	Initialization sequence.....	1453
31.5.2	Generation of Start.....	1453
31.5.3	Post-transfer software response.....	1453
31.5.4	Generation of Stop.....	1454
31.5.5	Generation of Repeated Start.....	1454
31.5.6	Slave mode.....	1455
31.5.7	Arbitration lost.....	1455
31.6	Software restriction.....	1461
31.7	I2C Memory Map/Register Definition.....	1462
31.7.1	I2C Address Register (I2Cx_IADR).....	1463
31.7.2	I2C Frequency Divider Register (I2Cx_IFDR).....	1463
31.7.3	I2C Control Register (I2Cx_I2CR).....	1465
31.7.4	I2C Status Register (I2Cx_I2SR).....	1466

<b>Section number</b>	<b>Title</b>	<b>Page</b>
31.7.5	I2C Data I/O Register (I2Cx_I2DR).....	1468
<b>Chapter 32</b> <b>IOMUX Controller (IOMUXC)</b>		
32.1	Overview.....	1469
32.1.1	Features.....	1470
32.2	Clocks.....	1471
32.3	Functional description.....	1471
32.3.1	ALT6 and ALT7 extended muxing modes.....	1472
32.3.2	SW Loopback through SION bit.....	1473
32.3.3	Daisy chain - multi pads driving same module input pin.....	1473
32.4	IOMUXC GPR Memory Map/Register Definition.....	1474
32.4.1	GPR0 General Purpose Register (IOMUXC_GPR_GPR0).....	1475
32.4.2	GPR1 General Purpose Register (IOMUXC_GPR_GPR1).....	1478
32.4.3	GPR2 General Purpose Register (IOMUXC_GPR_GPR2).....	1481
32.4.4	GPR3 General Purpose Register (IOMUXC_GPR_GPR3).....	1484
32.4.5	GPR4 General Purpose Register (IOMUXC_GPR_GPR4).....	1487
32.4.6	GPR5 General Purpose Register (IOMUXC_GPR_GPR5).....	1490
32.4.7	GPR9 General Purpose Register (IOMUXC_GPR_GPR9).....	1493
32.4.8	GPR10 General Purpose Register (IOMUXC_GPR_GPR10).....	1494
32.4.9	GPR14 General Purpose Register (IOMUXC_GPR_GPR14).....	1495
32.5	IOMUXC SNVS Memory Map/Register Definition.....	1495
32.5.1	SW_MUX_CTL_PAD_BOOT_MODE0 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_BOOT_MODE0).....	1497
32.5.2	SW_MUX_CTL_PAD_BOOT_MODE1 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_BOOT_MODE1).....	1498
32.5.3	SW_MUX_CTL_PAD_SNVS_TAMPER0 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER0).....	1499
32.5.4	SW_MUX_CTL_PAD_SNVS_TAMPER1 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER1).....	1500

<b>Section number</b>	<b>Title</b>	<b>Page</b>
32.5.5	SW_MUX_CTL_PAD_SNVS_TAMPER2 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER2).....	1501
32.5.6	SW_MUX_CTL_PAD_SNVS_TAMPER3 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER3).....	1502
32.5.7	SW_MUX_CTL_PAD_SNVS_TAMPER4 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER4).....	1503
32.5.8	SW_MUX_CTL_PAD_SNVS_TAMPER5 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER5).....	1504
32.5.9	SW_MUX_CTL_PAD_SNVS_TAMPER6 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER6).....	1505
32.5.10	SW_MUX_CTL_PAD_SNVS_TAMPER7 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER7).....	1506
32.5.11	SW_MUX_CTL_PAD_SNVS_TAMPER8 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER8).....	1507
32.5.12	SW_MUX_CTL_PAD_SNVS_TAMPER9 SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_SNVS_TAMPER9).....	1508
32.5.13	SW_PAD_CTL_PAD_TEST_MODE SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_TEST_MODE).....	1509
32.5.14	SW_PAD_CTL_PAD_POR_B SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_POR_B).....	1511
32.5.15	SW_PAD_CTL_PAD_ONOFF SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_ONOFF).....	1513
32.5.16	SW_PAD_CTL_PAD_SNVS_PMIC_ON_REQ SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_PMIC_ON_REQ).....	1515
32.5.17	SW_PAD_CTL_PAD_CCM_PMIC_STBY_REQ SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_CCM_PMIC_STBY_REQ).....	1517
32.5.18	SW_PAD_CTL_PAD_BOOT_MODE0 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_BOOT_MODE0).....	1519
32.5.19	SW_PAD_CTL_PAD_BOOT_MODE1 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_BOOT_MODE1).....	1521
32.5.20	SW_PAD_CTL_PAD_SNVS_TAMPER0 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER0).....	1523

<b>Section number</b>	<b>Title</b>	<b>Page</b>
32.5.21	SW_PAD_CTL_PAD_SNVS_TAMPER1 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER1).....	1525
32.5.22	SW_PAD_CTL_PAD_SNVS_TAMPER2 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER2).....	1527
32.5.23	SW_PAD_CTL_PAD_SNVS_TAMPER3 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER3).....	1529
32.5.24	SW_PAD_CTL_PAD_SNVS_TAMPER4 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER4).....	1531
32.5.25	SW_PAD_CTL_PAD_SNVS_TAMPER5 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER5).....	1533
32.5.26	SW_PAD_CTL_PAD_SNVS_TAMPER6 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER6).....	1535
32.5.27	SW_PAD_CTL_PAD_SNVS_TAMPER7 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER7).....	1537
32.5.28	SW_PAD_CTL_PAD_SNVS_TAMPER8 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER8).....	1539
32.5.29	SW_PAD_CTL_PAD_SNVS_TAMPER9 SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_SNVS_TAMPER9).....	1541
32.6	IOMUXC Memory Map/Register Definition.....	1542
32.6.1	SW_MUX_CTL_PAD_JTAG_MOD SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_MOD).....	1562
32.6.2	SW_MUX_CTL_PAD_JTAG_TMS SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TMS).....	1563
32.6.3	SW_MUX_CTL_PAD_JTAG_TDO SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TDO).....	1564
32.6.4	SW_MUX_CTL_PAD_JTAG_TDI SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TDI).....	1565
32.6.5	SW_MUX_CTL_PAD_JTAG_TCK SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TCK).....	1566
32.6.6	SW_MUX_CTL_PAD_JTAG_TRST_B SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_JTAG_TRST_B).....	1567
32.6.7	SW_MUX_CTL_PAD_GPIO1_IO00 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO00).....	1568

<b>Section number</b>	<b>Title</b>	<b>Page</b>

## Chapter 33 Keypad Port (KPP)

33.1	Overview .....	2111
33.1.1	Features.....	2113
33.1.2	Modes and Operations.....	2113
33.2	Clocks.....	2113
33.3	External Signals.....	2113
33.3.1	Input Pins.....	2114
33.3.2	Output Pins.....	2115
33.3.3	Generation of Transfer Error Signal on Peripheral Bus.....	2115
33.4	Functional Description.....	2115
33.4.1	Keypad Matrix Construction.....	2116
33.4.2	Keypad Port Configuration.....	2116
33.4.3	Keypad Matrix Scanning.....	2116
33.4.4	Keypad Standby.....	2117
33.4.5	Glitch Suppression on Keypad Inputs.....	2117

<b>Section number</b>	<b>Title</b>	<b>Page</b>
33.4.6	Multiple Key Closures.....	2118
33.4.6.1	Ghost Key Problem and Correction.....	2120
33.4.7	3-Point Contact Keys Support.....	2122
33.5	Initialization/Application Information.....	2123
33.5.1	Typical Keypad Configuration and Scanning Sequence.....	2123
33.5.2	Key Press Interrupt Scanning Sequence.....	2124
33.5.3	Additional Comments.....	2124
33.6	KPP Memory Map/Register Definition.....	2124
33.6.1	Keypad Control Register (KPP_KPCR).....	2125
33.6.2	Keypad Status Register (KPP_KPSR).....	2126
33.6.3	Keypad Data Direction Register (KPP_KDDR).....	2127
33.6.4	Keypad Data Register (KPP_KPDR).....	2128

## Chapter 34 Enhanced LCD Interface (eLCDIF)

34.1	Overview.....	2131
34.2	External Signals.....	2131
34.3	Clocks.....	2132
34.4	Functional Description.....	2133
34.4.1	Bus Interface Mechanisms.....	2134
34.4.1.1	Bus Master Operation in Write/Display Modes.....	2135
34.4.1.2	System Bus Master Performance.....	2135
34.4.2	Write Data Path.....	2136
34.4.3	Read Data Path.....	2143
34.4.4	eLCDIF Interrupts.....	2148
34.4.5	Initializing the eLCDIF.....	2148
34.4.5.1	Write Modes.....	2148
34.4.5.2	MPU Read Mode.....	2149
34.4.6	MPU Interface.....	2150
34.4.6.1	Code Example to Initialize the eLCDIF in MPU Write Mode.....	2152

<b>Section number</b>	<b>Title</b>	<b>Page</b>
34.4.7	VSYNC Interface.....	2152
34.4.7.1	Code Example to Initialize eLCDIF in VSYNC Mode.....	2153
34.4.8	DOTCLK Interface.....	2154
34.4.8.1	Code Example.....	2156
34.4.9	CSI HANDSHAKE INTERFACE.....	2156
34.4.10	Alpha Blending Interface.....	2157
34.4.11	ITU-R BT.656 Digital Video Interface (DVI).....	2157
34.4.12	eLCDIF Pin Usage by Interface Mode.....	2159
34.5	Behavior During Reset.....	2165
34.6	eLCDIF Memory Map/Register Definition.....	2165
34.6.1	eLCDIF General Control Register (LCDIF_CTRL $n$ ).....	2168
34.6.2	eLCDIF General Control1 Register (LCDIF_CTRL1 $n$ ).....	2171
34.6.3	eLCDIF General Control2 Register (LCDIF_CTRL2 $n$ ).....	2173
34.6.4	eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT).....	2176
34.6.5	LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF).....	2176
34.6.6	LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF).....	2177
34.6.7	LCD Interface Timing Register (LCDIF_TIMING).....	2177
34.6.8	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0 $n$ ).....	2178
34.6.9	eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1).....	2180
34.6.10	LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2).....	2180
34.6.11	eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3).....	2181
34.6.12	eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4).....	2182
34.6.13	Digital Video Interface Control0 Register (LCDIF_DVICTRL0).....	2183
34.6.14	Digital Video Interface Control1 Register (LCDIF_DVICTRL1).....	2183
34.6.15	Digital Video Interface Control2 Register (LCDIF_DVICTRL2).....	2184
34.6.16	Digital Video Interface Control3 Register (LCDIF_DVICTRL3).....	2185
34.6.17	Digital Video Interface Control4 Register (LCDIF_DVICTRL4).....	2186
34.6.18	RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIF_CSC_COEFF0).....	2187
34.6.19	RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIF_CSC_COEFF1).....	2188

<b>Section number</b>	<b>Title</b>	<b>Page</b>
34.6.20	RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIF_CSC_COEFF2).....	2189
34.6.21	RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIF_CSC_COEFF3).....	2189
34.6.22	RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIF_CSC_COEFF4).....	2190
34.6.23	RGB to YCbCr 4:2:2 CSC Offset Register (LCDIF_CSC_OFFSET).....	2191
34.6.24	RGB to YCbCr 4:2:2 CSC Limit Register (LCDIF_CSC_LIMIT).....	2191
34.6.25	LCD Interface Data Register (LCDIF_DATA).....	2192
34.6.26	Bus Master Error Status Register (LCDIF_BM_ERROR_STAT).....	2193
34.6.27	CRC Status Register (LCDIF_CRC_STAT).....	2193
34.6.28	LCD Interface Status Register (LCDIF_STAT).....	2194
34.6.29	eLCDIF Threshold Register (LCDIF_THRES).....	2196
34.6.30	eLCDIF AS Buffer Control Register (LCDIF_AS_CTRL).....	2197
34.6.31	Alpha Surface Buffer Pointer (LCDIF_AS_BUF).....	2199
34.6.32	LCDIF_AS_NEXT_BUF.....	2200
34.6.33	eLCDIF Overlay Color Key Low (LCDIF_AS_CLRKEYLOW).....	2200
34.6.34	eLCDIF Overlay Color Key High (LCDIF_AS_CLRKEYHIGH).....	2201
34.6.35	LCD working insync mode with CSI for VSYNC delay (LCDIF_SYNC_DELAY).....	2201

## Chapter 35 Multi Mode DDR Controller (MMDC)

35.1	Overview.....	2203
35.1.1	MMDC feature summary.....	2204
35.2	External Signals.....	2206
35.3	Clocks.....	2207
35.4	Functional Description.....	2207
35.4.1	Write/Read data flow.....	2207
35.4.1.1	Write data flow.....	2207
35.4.1.2	Read data flow.....	2208
35.4.2	MMDC initialization .....	2208
35.4.3	Configuring the MMDC registers.....	2210
35.4.4	MMDC Address Space.....	2210

<b>Section number</b>	<b>Title</b>	<b>Page</b>
35.4.4.1	Address decoding .....	2210
35.4.4.2	Chip select settings.....	2213
35.4.4.2.1	Creating 4 Gbyte address space with 2 Gbyte CS density.....	2213
35.4.4.2.2	Creating 2 Gbyte address spaces with 1 Gbyte CS density.....	2213
35.4.4.3	Translation of AXI accesses to DDR accessess.....	2214
35.4.4.3.1	Example 1.....	2214
35.4.4.3.2	Example 2.....	2215
35.4.4.3.3	Example 3.....	2216
35.4.4.3.4	Example 4.....	2216
35.4.4.3.5	Example 5.....	2217
35.4.4.4	Address mirroring .....	2218
35.4.5	LPDDR2 and DDR3 pin mux mapping.....	2218
35.4.6	Power Saving and Clock Frequency Change modes.....	2219
35.4.6.1	Power saving general.....	2220
35.4.6.2	Self refresh and Frequency change entry/exit.....	2221
35.4.7	Reset .....	2222
35.4.7.1	Hard reset.....	2222
35.4.7.2	Warm reset.....	2222
35.4.7.3	Software reset .....	2223
35.4.8	Refresh Scheme.....	2224
35.4.9	Burst Length options towards DDR.....	2224
35.4.10	Exclusive accesses handling.....	2225
35.4.11	AXI Error Handling.....	2226
35.5	Performance.....	2226
35.5.1	Arbitration and reordering mechanism.....	2226
35.5.1.1	Arbitration General.....	2226
35.5.1.2	Real time channel mode.....	2227
35.5.1.3	Dynamic scoring mode (Arbitration Winning Conditions).....	2227
35.5.1.4	Guarding (aging) mechanism.....	2228

<b>Section number</b>	<b>Title</b>	<b>Page</b>
35.5.2	Prediction mechanism.....	2229
35.5.3	Special Optimization for accesses towards DDR3.....	2229
35.6	MMDC Debug .....	2230
35.6.1	Hardware debug monitor.....	2230
35.6.2	Step By Step (SBS) software monitor.....	2231
35.7	MMDC Profiling.....	2231
35.8	LPDDR2 Refresh Rate Update and Timing Derating.....	2232
35.9	DLL Switching.....	2233
35.9.1	DLL Off mode.....	2233
35.10	ODT Configuration .....	2235
35.11	Calibration Process.....	2236
35.11.1	Delay-line.....	2237
35.11.2	ZQ calibration .....	2237
35.11.2.1	ZQ automatic (hardware) calibration process.....	2238
35.11.2.1.1	ZQ automatic Pull-up calibration.....	2239
35.11.2.1.2	ZQ automatic Pull-down calibration.....	2239
35.11.2.2	ZQ software calibration process.....	2239
35.11.2.3	ZQ calibration commands .....	2240
35.11.3	Read DQS Gating Calibration.....	2240
35.11.3.1	Hardware DQS Gating Calibration.....	2240
35.11.3.1.1	Hardware DQS Calibration with MPR.....	2241
35.11.3.1.2	Hardware DQS Calibration with pre-defined value.....	2241
35.11.3.2	SW read DQS gating Calibration.....	2244
35.11.3.2.1	SW read Calibration with MPR.....	2244
35.11.3.2.2	SW read Calibration with pre-defined value.....	2244
35.11.4	Read Calibration.....	2246
35.11.4.1	Hardware (automatic) Read Calibration.....	2247
35.11.4.1.1	Hardware (automatic) Calibration with MPR/DQ Calibration.....	2247
35.11.4.1.2	Hardware (automatic) Calibration with pre-defined value.....	2247

<b>Section number</b>	<b>Title</b>	<b>Page</b>
35.11.4.2	SW Read Calibration.....	2249
35.11.4.2.1	Calibration with MPR/DQ calibration.....	2249
35.11.4.2.2	Calibration with pre-defined value.....	2249
35.11.5	Write Calibration.....	2251
35.11.5.1	HW (automatic) Write Calibration.....	2251
35.11.5.2	SW Write Calibration.....	2253
35.11.6	Write leveling Calibration.....	2254
35.11.6.1	Hardware Write Leveling Calibration.....	2255
35.11.6.2	SW Write Leveling Calibration.....	2256
35.11.7	Write fine tuning.....	2257
35.11.8	Read fine tuning.....	2258
35.11.9	ZQ Fine Tuning.....	2258
35.11.10	Duty cycle adjustment.....	2258
35.12	MMDC Memory Map/Register Definition.....	2258
35.12.1	MMDC Core Control Register (MMDC_MDCTL).....	2263
35.12.2	MMDC Core Power Down Control Register (MMDC_MDPDC).....	2264
35.12.3	MMDC Core ODT Timing Control Register (MMDC_MDOTC).....	2267
35.12.4	MMDC Core Timing Configuration Register 0 (MMDC_MDCFG0).....	2269
35.12.5	MMDC Core Timing Configuration Register 1 (MMDC_MDCFG1).....	2270
35.12.6	MMDC Core Timing Configuration Register 2 (MMDC_MDCFG2).....	2273
35.12.7	MMDC Core Miscellaneous Register (MMDC_MDMISC).....	2275
35.12.8	MMDC Core Special Command Register (MMDC_MDSCR).....	2278
35.12.9	MMDC Core Refresh Control Register (MMDC_MDREF).....	2281
35.12.10	MMDC Core Read/Write Command Delay Register (MMDC_MDRWD).....	2283
35.12.11	MMDC Core Out of Reset Delays Register (MMDC_MDOR).....	2285
35.12.12	MMDC Core MRR Data Register (MMDC_MDMRR).....	2286
35.12.13	MMDC Core Timing Configuration Register 3 (MMDC_MDCFG3LP).....	2287
35.12.14	MMDC Core MR4 Derating Register (MMDC_MDMR4).....	2289
35.12.15	MMDC Core Address Space Partition Register (MMDC_MDASP).....	2291

<b>Section number</b>	<b>Title</b>	<b>Page</b>
35.12.16	MMDC Core AXI Reordering Control Register (MMDC_MAARCR).....	2292
35.12.17	MMDC Core Power Saving Control and Status Register (MMDC_MAPSR).....	2294
35.12.18	MMDC Core Exclusive ID Monitor Register0 (MMDC_MAEXIDR0).....	2296
35.12.19	MMDC Core Exclusive ID Monitor Register1 (MMDC_MAEXIDR1).....	2297
35.12.20	MMDC Core Debug and Profiling Control Register 0 (MMDC_MADPCR0).....	2298
35.12.21	MMDC Core Debug and Profiling Control Register 1 (MMDC_MADPCR1).....	2299
35.12.22	MMDC Core Debug and Profiling Status Register 0 (MMDC_MADPSR0).....	2300
35.12.23	MMDC Core Debug and Profiling Status Register 1 (MMDC_MADPSR1).....	2300
35.12.24	MMDC Core Debug and Profiling Status Register 2 (MMDC_MADPSR2).....	2301
35.12.25	MMDC Core Debug and Profiling Status Register 3 (MMDC_MADPSR3).....	2301
35.12.26	MMDC Core Debug and Profiling Status Register 4 (MMDC_MADPSR4).....	2302
35.12.27	MMDC Core Debug and Profiling Status Register 5 (MMDC_MADPSR5).....	2302
35.12.28	MMDC Core Step By Step Address Register (MMDC_MASBS0).....	2303
35.12.29	MMDC Core Step By Step Address Attributes Register (MMDC_MASBS1).....	2303
35.12.30	MMDC Core General Purpose Register (MMDC_MAGENP).....	2304
35.12.31	MMDC PHY ZQ HW control register (MMDC_MPZQHWCTRL).....	2305
35.12.32	MMDC PHY ZQ SW control register (MMDC_MPZQSWCTRL).....	2308
35.12.33	MMDC PHY Write Leveling Configuration and Error Status Register (MMDC_MPWLGCR).....	2310
35.12.34	MMDC PHY Write Leveling Delay Control Register 0 (MMDC_MPWLDECTRL0).....	2313
35.12.35	MMDC PHY Write Leveling Delay Control Register 1 (MMDC_MPWLDECTRL1).....	2315
35.12.36	MMDC PHY Write Leveling delay-line Status Register (MMDC_MPWLDSL).....	2318
35.12.37	MMDC PHY ODT control register (MMDC_MPODTCTRL).....	2319
35.12.38	MMDC PHY Read DQ Byte0 Delay Register (MMDC_MPRDDQBY0DL).....	2321
35.12.39	MMDC PHY Read DQ Byte1 Delay Register (MMDC_MPRDDQBY1DL).....	2324
35.12.40	MMDC PHY Write DQ Byte0 Delay Register (MMDC_MPWRDQBY0DL).....	2327
35.12.41	MMDC PHY Write DQ Byte1 Delay Register (MMDC_MPWRDQBY1DL).....	2329
35.12.42	MMDC PHY Write DQ Byte2 Delay Register (MMDC_MPWRDQBY2DL).....	2331
35.12.43	MMDC PHY Write DQ Byte3 Delay Register (MMDC_MPWRDQBY3DL).....	2333
35.12.44	MMDC PHY Read DQS Gating Control Register 0 (MMDC_MPDGCTRL0).....	2336

<b>Section number</b>	<b>Title</b>	<b>Page</b>
35.12.45	MMDC PHY Read DQS Gating Control Register 1 (MMDC_MPDGCTRL1).....	2338
35.12.46	MMDC PHY Read DQS Gating delay-line Status Register (MMDC_MPDGDLST0).....	2340
35.12.47	MMDC PHY Read delay-lines Configuration Register (MMDC_MPRDDLCTL).....	2342
35.12.48	MMDC PHY Read delay-lines Status Register (MMDC_MPRDDLST).....	2344
35.12.49	MMDC PHY Write delay-lines Configuration Register (MMDC_MPWRDLCTL).....	2346
35.12.50	MMDC PHY Write delay-lines Status Register (MMDC_MPWRDLST).....	2348
35.12.51	MMDC PHY CK Control Register (MMDC_MPSDCTRL).....	2349
35.12.52	MMDC ZQ LPDDR2 HW Control Register (MMDC_MPZQLP2CTL).....	2350
35.12.53	MMDC PHY Read Delay HW Calibration Control Register (MMDC_MPRDDLHWCTL).....	2352
35.12.54	MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL).....	2355
35.12.55	MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC_MPRDDLHWST0).....	2357
35.12.56	MMDC PHY Write Delay HW Calibration Status Register 0 (MMDC_MPWRDLHWST0).....	2358
35.12.57	MMDC PHY Write Leveling HW Error Register (MMDC_MPWLHWERR).....	2359
35.12.58	MMDC PHY Read DQS Gating HW Status Register 0 (MMDC_MPDGHWST0).....	2359
35.12.59	MMDC PHY Read DQS Gating HW Status Register 1 (MMDC_MPDGHWST1).....	2360
35.12.60	MMDC PHY Read DQS Gating HW Status Register 2 (MMDC_MPDGHWST2).....	2360
35.12.61	MMDC PHY Read DQS Gating HW Status Register 3 (MMDC_MPDGHWST3).....	2361
35.12.62	MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1).....	2361
35.12.63	MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2).....	2363
35.12.64	MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0).....	2366
35.12.65	MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0).....	2368
35.12.66	MMDC PHY SW Dummy Read Data Register 1 (MMDC_MPSWDRDR1).....	2368
35.12.67	MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2).....	2369
35.12.68	MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3).....	2369
35.12.69	MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4).....	2369
35.12.70	MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5).....	2370
35.12.71	MMDC PHY SW Dummy Read Data Register 6 (MMDC_MPSWDRDR6).....	2370
35.12.72	MMDC PHY SW Dummy Read Data Register 7 (MMDC_MPSWDRDR7).....	2371

Section number	Title	Page
35.12.73	MMDC PHY Measure Unit Register (MMDC_MPMUR0).....	2371
35.12.74	MMDC Write CA delay-line controller (MMDC_MPWRCADL).....	2372
35.12.75	MMDC Duty Cycle Control Register (MMDC_MPDCCR).....	2374

## Chapter 36 Medium Quality Sound (MQS)

36.1	Overview.....	2377
36.1.1	Block Diagram.....	2377
36.2	External Signals.....	2378
36.3	Interface Signals.....	2379
36.4	Programming Considerations.....	2379
36.4.1	Usage Model.....	2380

## Chapter 37 On-Chip OTP Controller (OCOTP\_CTRL)

37.1	Overview.....	2381
37.1.1	Features.....	2381
37.2	Clocks.....	2381
37.3	Top-Level Symbol and Functional Overview.....	2382
37.3.1	Operation.....	2382
37.3.1.1	Shadow Register Reload.....	2383
37.3.1.2	Fuse and Shadow Register Read.....	2383
37.3.1.3	Fuse and Shadow Register Writes.....	2383
37.3.1.4	Write Postamble.....	2385
37.3.2	Fuse Shadow Memory Footprint.....	2385
37.3.3	OTP Read/Write Timing Parameters.....	2387
37.3.4	Hardware Visible Fuses.....	2387
37.3.5	Behavior During Reset.....	2387
37.3.6	Secure JTAG control.....	2387
37.4	Fuse Map.....	2388
37.5	OCOTP Memory Map/Register Definition.....	2388

<b>Section number</b>	<b>Title</b>	<b>Page</b>
37.5.1	OTP Controller Control Register (OCOTP_CTRL $n$ ).....	2392
37.5.2	OTP Controller Timing Register (OCOTP_TIMING).....	2394
37.5.3	OTP Controller Write Data Register (OCOTP_DATA).....	2394
37.5.4	OTP Controller Read Control Register (OCOTP_READ_CTRL).....	2395
37.5.5	OTP Controller Read Fuse Data Register (OCOTP_READ_FUSE_DATA).....	2396
37.5.6	Sticky bit Register (OCOTP_SW_STICKY).....	2396
37.5.7	Software Controllable Signals Register (OCOTP_SCS $n$ ).....	2397
37.5.8	OTP Controller CRC Test Address (OCOTP_CRC_ADDR).....	2398
37.5.9	OTP Controller CRC Value Register (OCOTP_CRC_VALUE).....	2399
37.5.10	OTP Controller Version Register (OCOTP_VERSION).....	2400
37.5.11	OTP Controller Timing Register 2 (OCOTP_TIMING2).....	2400
37.5.12	Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK).....	2401
37.5.13	Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0).....	2404
37.5.14	Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1).....	2405
37.5.15	Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2).....	2405
37.5.16	Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3).....	2406
37.5.17	Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4).....	2406
37.5.18	Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5).....	2407
37.5.19	Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6).....	2407
37.5.20	Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0).....	2408
37.5.21	Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1).....	2408
37.5.22	Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2).....	2409
37.5.23	Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3).....	2409
37.5.24	Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4).....	2410
37.5.25	Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0).....	2410
37.5.26	Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1).....	2411
37.5.27	Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2).....	2411
37.5.28	Value of OTP Bank2 Word0 (OTPMK Key) (OCOTP_OTPMK0).....	2412
37.5.29	Value of OTP Bank2 Word1 (OTPMK Key) (OCOTP_OTPMK1).....	2412

## Chapter 38 On-Chip RAM Memory Controller (OCRAM)

38.1	Overview.....	2435
38.2	Basic Functions.....	2436
38.2.1	Read/Write Arbitration.....	2436
38.3	Advanced Features.....	2437
38.3.1	Read Data Wait State.....	2437
38.3.2	Read Address Pipeline.....	2437
38.3.3	Write Data Pipeline.....	2438
38.3.4	Write Address Pipeline.....	2438
38.4	Programmable Registers.....	2439

## Chapter 39

Section number	Title	Page
	<b>Power Management Unit (PMU)</b>	
39.1	Overview.....	2441
39.2	Digital LDO Regulators.....	2443
39.3	Analog LDO Regulators.....	2444
39.3.1	LDO 1P1.....	2444
39.3.2	LDO 2P5.....	2444
39.3.3	Low Power Operation.....	2445
39.4	USB LDO Regulator.....	2446
39.5	SNVS Regulator.....	2446
39.6	PMU Memory Map/Register Definition.....	2446
39.6.1	Regulator 1P1 Register (PMU_REG_1P1 $n$ ).....	2449
39.6.2	Regulator 3P0 Register (PMU_REG_3P0 $n$ ).....	2452
39.6.3	Regulator 2P5 Register (PMU_REG_2P5 $n$ ).....	2454
39.6.4	Digital Regulator Core Register (PMU_REG_CORE $n$ ).....	2456
39.6.5	Miscellaneous Register 0 (PMU_MISC0 $n$ ).....	2458
39.6.6	Miscellaneous Register 1 (PMU_MISC1 $n$ ).....	2462
39.6.7	Miscellaneous Control Register (PMU_MISC2 $n$ ).....	2464
39.6.8	Low Power Control Register (PMU_LOWPWR_CTRL $n$ ).....	2469

## Chapter 40 Pulse Width Modulation (PWM)

40.1	Overview.....	2473
40.2	External Signals.....	2474
40.3	Clocks.....	2476
40.4	Functional Description.....	2477
40.4.1	Operation.....	2477
40.4.1.1	FIFO.....	2478
40.4.1.2	Rollover and Compare Event.....	2478
40.4.1.3	Low Power Mode Behavior.....	2479
40.4.1.4	Debug Mode Behavior.....	2479

<b>Section number</b>	<b>Title</b>	<b>Page</b>
40.5	Enable Sequence for the PWM.....	2479
40.6	Disable Sequence for the PWM.....	2479
40.7	PWM Memory Map/Register Definition.....	2480
40.7.1	PWM Control Register (PWMrx_PWMCR).....	2482
40.7.2	PWM Status Register (PWMrx_PWMSR).....	2484
40.7.3	PWM Interrupt Register (PWMrx_PWMIR).....	2485
40.7.4	PWM Sample Register (PWMrx_PWMSAR).....	2486
40.7.5	PWM Period Register (PWMrx_PWMPCR).....	2487
40.7.6	PWM Counter Register (PWMrx_PWMCNR).....	2488

## **Chapter 41 Pixel Pipeline (PXP)**

41.1	Overview.....	2489
41.2	Clocks.....	2490
41.3	Top-level architecture.....	2490
41.3.1	Processing Details.....	2493
41.3.2	Scaling Operation.....	2494
41.3.3	Decimation Image Scaling.....	2495
41.3.4	Bilinear Image Scaling Filter .....	2497
41.3.5	YUV 4:2:2 Image Scaling.....	2499
41.3.6	YUV 4:2:0 Image Scaling.....	2500
41.3.7	RGB/YUV444 Image Scaling.....	2502
41.3.8	Color Space Conversion (CSC).....	2502
41.3.9	CSC1 Operation.....	2503
41.3.10	YUV versus YCbCr Support.....	2504
41.3.11	CSC2 operation.....	2504
41.3.12	Alpha Blending/Color Key .....	2504
41.3.13	Alpha Blend.....	2505
41.3.13.1	Normal Alpha Blend.....	2505
41.3.13.2	Porter-Duff Alpha Blend.....	2506

<b>Section number</b>	<b>Title</b>	<b>Page</b>
41.3.14	Color Key.....	2506
41.3.15	LUT.....	2507
41.3.16	Lookup Modes.....	2507
41.3.17	DIRECT_Y8.....	2508
41.3.18	DIRECT_RGB444.....	2508
41.3.19	DIRECT_RGB454.....	2508
41.3.20	CACHE_RGB565.....	2508
41.3.21	Output Modes.....	2510
41.3.22	Y8 .....	2510
41.3.23	RGBW4444CFA.....	2511
	41.3.23.1    CFA Correction.....	2511
41.3.24	RGB888.....	2512
41.3.25	Rotation.....	2512
41.3.26	Output Buffer.....	2515
41.3.27	Address calculator.....	2515
41.3.28	Block size selection.....	2515
41.3.29	Interlaced Video Support.....	2515
41.3.30	LCDIF Handshake.....	2516
41.3.31	LCDIF Abort.....	2519
41.3.32	Theory of Operation.....	2519
41.3.33	Pixel Handling.....	2520
41.3.34	Output Buffer Composition.....	2520
41.3.35	PS Image Processing.....	2521
41.3.36	Letterboxing.....	2522
41.3.37	Clipping source images.....	2522
41.3.38	Color Key Processing.....	2524
41.3.39	In Place Processing (PS buffer is destination buffer).....	2526
41.3.40	Alpha Surface (AS) Processing.....	2526
41.3.41	Alpha Handling.....	2526

<b>Section number</b>	<b>Title</b>	<b>Page</b>
41.3.42	Color Key Processing (AS_CTRL).....	2526
41.4	Output Image Processing.....	2527
41.4.1	Output Image Size.....	2527
41.4.2	Output Format.....	2527
41.4.3	Rotation/Flip operations.....	2527
41.5	Queuing PXP transactions.....	2528
41.6	Error Handling.....	2528
41.6.1	Known PXP Limitations/Issues.....	2529
41.7	Dither Engine Block.....	2529
41.7.1	Top Level Connections.....	2530
41.7.2	Dither Engine Design.....	2530
41.7.3	Pipelined Data Flow.....	2534
41.7.4	Initialization of Dedicated Memories.....	2534
41.7.5	Register Configuration Interface.....	2535
41.8	Waveform Engines.....	2535
41.8.1	Overview.....	2535
41.8.2	Functionality.....	2536
41.9	PXP Store Engine Block Description.....	2537
41.9.1	Overview.....	2537
41.9.2	Top-Level Architecture.....	2537
41.9.3	Store Engine Design.....	2538
41.9.3.1	Input Data Source.....	2539
41.9.3.2	Store data shift operation.....	2539
41.9.3.3	Data Packing.....	2540
41.9.3.4	Data Store Format.....	2541
41.9.3.5	Output Format Modes.....	2542
41.9.3.6	Limitations.....	2545
41.10	Histogram.....	2545
41.10.1	Basic Operation.....	2545

<b>Section number</b>	<b>Title</b>	<b>Page</b>
41.10.2	Mask Functionality.....	2546
41.10.3	Collision use-case Example.....	2547
41.11	PXP Memory Map/Register Definition.....	2548
41.11.1	Control Register 0 (PXP_HW_PXP_CTRL $n$ ).....	2573
41.11.2	Status Register (PXP_HW_PXP_STAT $n$ ).....	2576
41.11.3	Output Buffer Control Register (PXP_HW_PXP_OUT_CTRL $n$ ).....	2578
41.11.4	Output Frame Buffer Pointer (PXP_HW_PXP_OUT_BUF).....	2579
41.11.5	Output Frame Buffer Pointer #2 (PXP_HW_PXP_OUT_BUF2).....	2579
41.11.6	Output Buffer Pitch (PXP_HW_PXP_OUT_PITCH).....	2580
41.11.7	Output Surface Lower Right Coordinate (PXP_HW_PXP_OUT_LRC).....	2580
41.11.8	Processed Surface Upper Left Coordinate (PXP_HW_PXP_OUT_PS_ULC).....	2581
41.11.9	Processed Surface Lower Right Coordinate (PXP_HW_PXP_OUT_PS_LRC).....	2582
41.11.10	Alpha Surface Upper Left Coordinate (PXP_HW_PXP_OUT_AS_ULC).....	2583
41.11.11	Alpha Surface Lower Right Coordinate (PXP_HW_PXP_OUT_AS_LRC).....	2583
41.11.12	Processed Surface (PS) Control Register (PXP_HW_PXP_PS_CTRL $n$ ).....	2584
41.11.13	PS Input Buffer Address (PXP_HW_PXP_PS_BUF).....	2585
41.11.14	PS U/Cb or 2 Plane UV Input Buffer Address (PXP_HW_PXP_PS_UBUF).....	2585
41.11.15	PS V/Cr Input Buffer Address (PXP_HW_PXP_PS_VBUF).....	2586
41.11.16	Processed Surface Pitch (PXP_HW_PXP_PS_PITCH).....	2586
41.11.17	PS Background Color (PXP_HW_PXP_PS_BACKGROUND_0).....	2587
41.11.18	PS Scale Factor Register (PXP_HW_PXP_PS_SCALE).....	2588
41.11.19	PS Scale Offset Register (PXP_HW_PXP_PS_OFFSET).....	2589
41.11.20	PS Color Key Low (PXP_HW_PXP_PS_CLRKEYLOW_0).....	2590
41.11.21	PS Color Key High (PXP_HW_PXP_PS_CLRKEYHIGH_0).....	2590
41.11.22	Alpha Surface Control (PXP_HW_PXP_AS_CTRL).....	2591
41.11.23	Alpha Surface Buffer Pointer (PXP_HW_PXP_AS_BUF).....	2592
41.11.24	Alpha Surface Pitch (PXP_HW_PXP_AS_PITCH).....	2592
41.11.25	Overlay Color Key Low (PXP_HW_PXP_AS_CLRKEYLOW_0).....	2593
41.11.26	Overlay Color Key High (PXP_HW_PXP_AS_CLRKEYHIGH_0).....	2594

<b>Section number</b>	<b>Title</b>	<b>Page</b>
41.11.27	Color Space Conversion Coefficient Register 0 (PXP_HW_PXP_CSC1_COEF0).....	2595
41.11.28	Color Space Conversion Coefficient Register 1 (PXP_HW_PXP_CSC1_COEF1).....	2596
41.11.29	Color Space Conversion Coefficient Register 2 (PXP_HW_PXP_CSC1_COEF2).....	2597
41.11.30	Color Space Conversion Control Register. (PXP_HW_PXP_CSC2_CTRL).....	2598
41.11.31	Color Space Conversion Coefficient Register 0 (PXP_HW_PXP_CSC2_COEF0).....	2598
41.11.32	Color Space Conversion Coefficient Register 1 (PXP_HW_PXP_CSC2_COEF1).....	2599
41.11.33	Color Space Conversion Coefficient Register 2 (PXP_HW_PXP_CSC2_COEF2).....	2600
41.11.34	Color Space Conversion Coefficient Register 3 (PXP_HW_PXP_CSC2_COEF3).....	2600
41.11.35	Color Space Conversion Coefficient Register 4 (PXP_HW_PXP_CSC2_COEF4).....	2601
41.11.36	Color Space Conversion Coefficient Register 5 (PXP_HW_PXP_CSC2_COEF5).....	2601
41.11.37	Lookup Table Control Register. (PXP_HW_PXP_LUT_CTRL).....	2602
41.11.38	Lookup Table Control Register. (PXP_HW_PXP_LUT_ADDR).....	2604
41.11.39	Lookup Table Data Register. (PXP_HW_PXP_LUT_DATA).....	2605
41.11.40	Lookup Table External Memory Address Register. (PXP_HW_PXP_LUT_EXTMEM).....	2605
41.11.41	Color Filter Array Register. (PXP_HW_PXP_CFA).....	2606
41.11.42	PXP Alpha Engine A Control Register. (PXP_HW_PXP_ALPHA_A_CTRL).....	2607
41.11.43	PS Background Color 1 (PXP_HW_PXP_PS_BACKGROUND_1).....	2608
41.11.44	PS Color Key Low 1 (PXP_HW_PXP_PS_CLRKEYLOW_1).....	2609
41.11.45	PS Color Key High 1 (PXP_HW_PXP_PS_CLRKEYHIGH_1).....	2609
41.11.46	Overlay Color Key Low (PXP_HW_PXP_AS_CLRKEYLOW_1).....	2610
41.11.47	Overlay Color Key High (PXP_HW_PXP_AS_CLRKEYHIGH_1).....	2611
41.11.48	Control Register 2 (PXP_HW_PXP_CTRL2n).....	2612
41.11.49	PXP Power Control Register. (PXP_HW_PXP_POWER_REG0).....	2613
41.11.50	PXP Power Control Register 1. (PXP_HW_PXP_POWER_REG1).....	2614
41.11.51	This register helps decide the data path gthrough the PXP. (PXP_HW_PXP_DATA_PATH_CTRL0n)	2615
41.11.52	This register helps decide the data path gthrough the PXP. (PXP_HW_PXP_DATA_PATH_CTRL1n)	2616
41.11.53	Initialize memory buffer control Register (PXP_HW_PXP_INIT_MEM_CTRLn).....	2617
41.11.54	Write data Register (PXP_HW_PXP_INIT_MEM_DATA).....	2618
41.11.55	Write data Register (PXP_HW_PXP_INIT_MEM_DATA_HIGH).....	2618

<b>Section number</b>	<b>Title</b>	<b>Page</b>
41.11.56	PXP IRQ Mask Register (PXP_HW_PXP_IRQ_MASK $n$ ).....	2619
41.11.57	PXP Interrupt Register (PXP_HW_PXP_IRQn).....	2620
41.11.58	PXP NEXT Buffer Enable select Register (PXP_HW_PXP_NEXT_EN $n$ ).....	2621
41.11.59	Next Frame Pointer (PXP_HW_PXP_NEXT).....	2622
41.11.60	Debug Control Register (PXP_HW_PXP_DEBUGCTRL).....	2623
41.11.61	Debug Register (PXP_HW_PXP_DEBUG).....	2624
41.11.62	Version Register (PXP_HW_PXP_VERSION).....	2624
41.11.63	This register defines the control bits for the ppx store_engine sub-block. (PXP_HW_PXP_DITHER_STORE_SIZE_CH0).....	2625
41.11.64	Fetch engine Control for WFE B Register (PXP_HW_PXP_WFB_FETCH_CTRL $n$ ).....	2625
41.11.65	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_FETCH_BUF1_ADDR).....	2627
41.11.66	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_FETCH_BUF1_PITCH).....	2628
41.11.67	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_FETCH_BUF1_SIZE).....	2628
41.11.68	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_FETCH_BUF2_ADDR).....	2629
41.11.69	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_FETCH_BUF2_PITCH).....	2629
41.11.70	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_FETCH_BUF2_SIZE).....	2630
41.11.71	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_ARRAY_PIXEL0_MASK).....	2630
41.11.72	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_ARRAY_PIXEL1_MASK).....	2632
41.11.73	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_ARRAY_PIXEL2_MASK).....	2633
41.11.74	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_ARRAY_PIXEL3_MASK).....	2634
41.11.75	This register defines the control bits for the ppx wfb fetch sub-block. (PXP_HW_PXP_WFB_ARRAY_PIXEL4_MASK).....	2636

## Chapter 44 Random Number Generator (RNGB)

44.1	Introduction.....	3091
44.1.1	Block diagram.....	3091
44.1.2	Features.....	3092
44.2	Modes of operation.....	3092
44.2.1	Self-test mode.....	3092
44.2.2	Seed-generation mode.....	3092
44.2.3	Random number generation mode.....	3093
44.3	Memory map/register definition.....	3093
44.3.1	RNGB version ID register (RNG_VER).....	3094
44.3.2	RNGB command register (RNG_CMD).....	3094
44.3.3	RNGB control register (RNG_CR).....	3096
44.3.4	RNGB status register (RNG_SR).....	3098
44.3.5	RNGB error status register (RNG_ESR).....	3100
44.3.6	RNGB Output FIFO (RNG_OUT).....	3102
44.4	Functional description.....	3102
44.4.1	Pseudo-Random Number Generator (PRNG).....	3102
44.4.2	True Random Number Generator (TRNG).....	3103
44.4.3	Resets.....	3103
44.4.3.1	Power-on/hardware reset.....	3103
44.4.3.2	Software reset.....	3103
44.4.4	RNG interrupts.....	3104
44.5	Initialization/application information.....	3104
44.5.1	Manual seeding.....	3105
44.5.2	Automatic seeding.....	3105

	<b>Chapter 45 Synchronous Audio Interface (SAI)</b>	
45.1	Overview.....	3107
45.1.1	Features.....	3107
45.1.2	Block diagram.....	3107
45.1.3	Modes of operation.....	3108
45.1.3.1	Run mode.....	3108
45.1.3.2	Stop mode.....	3108
45.2	External Signals.....	3108
45.3	Functional description.....	3110
45.3.1	SAI clocking.....	3111
45.3.1.1	Audio master clock.....	3111
45.3.1.2	Bit clock.....	3112
45.3.1.3	Bus clock.....	3112
45.3.2	SAI resets.....	3113
45.3.2.1	Software reset.....	3113
45.3.2.2	FIFO reset.....	3113
45.3.3	Synchronous modes.....	3114
45.3.3.1	Synchronous mode.....	3114
45.3.4	Frame sync configuration.....	3114
45.3.5	Data FIFO.....	3115
45.3.5.1	Data alignment.....	3115
45.3.5.2	FIFO pointers.....	3116
45.3.6	Word mask register.....	3117
45.3.7	Interrupts and DMA requests.....	3117
45.3.7.1	FIFO request flag.....	3117
45.3.7.2	FIFO warning flag.....	3118
45.3.7.3	FIFO error flag.....	3118
45.3.7.4	Sync error flag.....	3118

45.4.4	SAI Transmit Configuration 3 Register (I2Sx_TCR3).....	3127
45.4.5	SAI Transmit Configuration 4 Register (I2Sx_TCR4).....	3128
45.4.6	SAI Transmit Configuration 5 Register (I2Sx_TCR5).....	3129
45.4.7	SAI Transmit Data Register (I2Sx_TDR $n$ ).....	3130
45.4.8	SAI Transmit FIFO Register (I2Sx_TFR $n$ ).....	3131
45.4.9	SAI Transmit Mask Register (I2Sx_TMR).....	3131
45.4.10	SAI Receive Control Register (I2Sx_RCSR).....	3132
45.4.11	SAI Receive Configuration 1 Register (I2Sx_RCR1).....	3135
45.4.12	SAI Receive Configuration 2 Register (I2Sx_RCR2).....	3136
45.4.13	SAI Receive Configuration 3 Register (I2Sx_RCR3).....	3137
45.4.14	SAI Receive Configuration 4 Register (I2Sx_RCR4).....	3138
45.4.15	SAI Receive Configuration 5 Register (I2Sx_RCR5).....	3140
45.4.16	SAI Receive Data Register (I2Sx_RDR $n$ ).....	3140
45.4.17	SAI Receive FIFO Register (I2Sx_RFR $n$ ).....	3141
45.4.18	SAI Receive Mask Register (I2Sx_RMR).....	3141
45.4.19	SAI MCLK Control Register (I2Sx_MCR).....	3142

## **Chapter 46** **Smart Direct Memory Access Controller (SDMA)**

46.1	Overview.....	3145
46.1.1	Block Diagram.....	3145
46.1.2	Features.....	3147
46.2	External Signals.....	3149
46.3	Clocks.....	3149
46.4	Functional Description.....	3149

<b>Section number</b>	<b>Title</b>	<b>Page</b>
46.4.1	SDMA Core.....	3150
46.4.1.1	SDMA Core Structure.....	3151
46.4.1.2	Program Control Unit (PCU).....	3154
46.4.1.2.1	Instruction Types.....	3154
46.4.1.2.2	PCU States.....	3155
46.4.1.3	SDMA Core Memory.....	3158
46.4.2	Scheduler.....	3158
46.4.2.1	Primary Functions.....	3158
46.4.2.2	Channels and DMA Requests.....	3159
46.4.2.2.1	Channels.....	3159
46.4.2.2.2	DMA Requests.....	3159
46.4.2.2.3	Mapping from DMA Requests to Channels and Priorities.....	3159
46.4.2.3	Scheduler Functional Description.....	3159
46.4.2.3.1	Scheduler Overview.....	3159
46.4.2.3.2	DMA Requests Scanning.....	3160
46.4.2.3.3	Mapping DMA Requests to Pending Channels.....	3161
46.4.2.3.4	Channel Overflow.....	3164
46.4.2.3.5	Runnable Channels Evaluation.....	3164
46.4.2.3.6	Next Channel Decision Tree.....	3166
46.4.2.3.7	Scheduler State Diagram.....	3168
46.4.2.3.8	Scheduler Pipeline Timing Diagram.....	3170
46.4.2.3.9	Channel-DMA Request Mapping.....	3170
46.4.2.3.10	Examples: How to Start a Channel.....	3170
46.4.2.4	Context Switching.....	3171
46.4.2.4.1	Context Switch Modes.....	3172
46.4.2.4.2	Context Switch Procedure.....	3172
46.4.2.4.3	Context Map in Memory.....	3174
46.4.3	Functional Units.....	3174
46.4.3.1	Burst DMA Unit.....	3174

<b>Section number</b>	<b>Title</b>	<b>Page</b>

49.4	Resource ownership control.....	3457
49.4.1	Access control .....	3457
49.4.1.1	Peripheral access.....	3457
49.4.1.2	Peripheral Right Register access.....	3458
49.4.2	Owner election.....	3459
49.4.3	Ending ownership.....	3459
49.4.3.1	Software Controlled Ownership Ending.....	3459
49.4.4	The Un-owned State.....	3460
49.5	SPBA Memory Map/Register Definition.....	3460
49.5.1	Peripheral Rights Register (SPBA_PRRn).....	3462

## **Chapter 50** **Sony/Philips Digital Interface (SPDIF)**

50.1	Overview .....	3465
50.2	External Signals.....	3467
50.3	Clocks.....	3467
50.4	Functional Description.....	3467
50.4.1	SPDIF Receiver.....	3469
50.4.1.1	Audio Data Reception.....	3469
50.4.1.1.1	Application Note.....	3471
50.4.1.2	Channel Status Reception.....	3472
50.4.1.2.1	Channel Status Interrupt.....	3472
50.4.1.3	User Bit Reception.....	3472
50.4.1.4	Validity Flag Reception.....	3474
50.4.1.5	SPDIF Receiver Interrupt Exception Definition.....	3475
50.4.1.6	Standards Compliance.....	3475

<b>Section number</b>	<b>Title</b>	<b>Page</b>
50.4.1.7	SPDIF PLOCK Detection and Rxclk Output.....	3476
50.4.1.8	Measuring Frequency of SPDIF_RxClk.....	3476
50.4.2	SPDIF Transmitter.....	3477
50.4.2.1	Audio Data Transmission.....	3477
50.4.2.2	Channel Status Transmission.....	3478
50.4.2.3	Validity Flag Transmission.....	3478
50.5	SPDIF Memory Map/Register Definition.....	3478
50.5.1	SPDIF Configuration Register (SPDIF_SCR).....	3480
50.5.2	CDText Control Register (SPDIF_SRCD).....	3482
50.5.3	PhaseConfig Register (SPDIF_SRPC).....	3483
50.5.4	InterruptEn Register (SPDIF_SIE).....	3484
50.5.5	InterruptStat Register (SPDIF_SIS).....	3486
50.5.6	InterruptClear Register (SPDIF_SIC).....	3488
50.5.7	SPDIFRxLeft Register (SPDIF_SRL).....	3489
50.5.8	SPDIFRxRight Register (SPDIF_SRR).....	3490
50.5.9	SPDIFRxCChannel_h Register (SPDIF_SRCSH).....	3490
50.5.10	SPDIFRxCChannel_l Register (SPDIF_SRCSL).....	3491
50.5.11	UchannelRx Register (SPDIF_SRU).....	3491
50.5.12	QchannelRx Register (SPDIF_SRQ).....	3492
50.5.13	SPDIFTxLeft Register (SPDIF_STL).....	3492
50.5.14	SPDIFTxRight Register (SPDIF_STR).....	3493
50.5.15	SPDIFTxCChannelCons_h Register (SPDIF_STCSCH).....	3493
50.5.16	SPDIFTxCChannelCons_l Register (SPDIF_STCSCL).....	3494
50.5.17	FreqMeas Register (SPDIF_SRFM).....	3494
50.5.18	SPDIFTxClk Register (SPDIF_STC).....	3495

## Chapter 51 System Reset Controller (SRC)

51.1	SRC Overview.....	3497
51.1.1	Features.....	3497

<b>Section number</b>	<b>Title</b>	<b>Page</b>
51.2	External Signals.....	3497
51.3	Clocks.....	3498
51.4	Top-level resets, power-up sequence and external supply integration.....	3499
51.4.1	Reset and Power-up Flow.....	3499
51.4.2	Finite-State Machine (FSM).....	3502
51.4.3	Power mode transitions.....	3503
51.5	Power-On Reset and power sequencing.....	3504
51.5.1	External POR using SRC_POR_B.....	3504
51.5.2	Internal POR.....	3505
51.6	Functional Description.....	3505
51.6.1	Reset Control.....	3505
51.6.1.1	Reset inputs and outputs.....	3505
51.6.1.2	Reset Handling.....	3507
51.6.1.2.1	Reset Qualification.....	3507
51.6.1.2.2	Reset Sequence and De-Assertion.....	3508
51.6.1.2.3	POR (SRC_POR_B).....	3508
51.6.1.2.4	COLD RESET.....	3509
51.6.1.2.5	WARM RESET.....	3510
51.6.2	Parallel Reset Requests.....	3511
51.6.3	Boot Mode Control.....	3512
51.6.3.1	BOOT_MODE Pin Latching.....	3512
51.7	SRC Memory Map/Register Definition.....	3513
51.7.1	SRC Control Register (SRC_SCR).....	3514
51.7.2	SRC Boot Mode Register 1 (SRC_SBMR1).....	3517
51.7.3	SRC Reset Status Register (SRC_SRSR).....	3517
51.7.4	SRC Interrupt Status Register (SRC_SISR).....	3520
51.7.5	SRC Boot Mode Register 2 (SRC_SBMR2).....	3522
51.7.6	SRC General Purpose Register 1 (SRC_GPR1).....	3523
51.7.7	SRC General Purpose Register 2 (SRC_GPR2).....	3524

<b>Section number</b>	<b>Title</b>	<b>Page</b>
51.7.8	SRC General Purpose Register 3 (SRC_GPR3).....	3524
51.7.9	SRC General Purpose Register 4 (SRC_GPR4).....	3525
51.7.10	SRC General Purpose Register 5 (SRC_GPR5).....	3525
51.7.11	SRC General Purpose Register 6 (SRC_GPR6).....	3526
51.7.12	SRC General Purpose Register 7 (SRC_GPR7).....	3526
51.7.13	SRC General Purpose Register 8 (SRC_GPR8).....	3527
51.7.14	SRC General Purpose Register 9 (SRC_GPR9).....	3527
51.7.15	SRC General Purpose Register 10 (SRC_GPR10).....	3528

## **Chapter 52 Temperature Monitor (TEMPMON)**

52.1	Overview.....	3529
52.2	Software Usage Guidelines.....	3530
52.3	TEMPMON Memory Map/Register Definition.....	3532
52.3.1	Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0 $n$ ).....	3533
52.3.2	Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1 $n$ ).....	3535
52.3.3	Tempsensor Control Register 2 (TEMPMON_TEMPSENSE2 $n$ ).....	3536

## **Chapter 53 Touch Screen Controller (TSC)**

53.1	Overview.....	3537
53.1.1	Features.....	3538
53.2	Functional Description.....	3539
53.2.1	Operating modes.....	3539
53.2.1.1	Idle.....	3539
53.2.1.2	Pre-charge.....	3539
53.2.1.3	Detection.....	3539
53.2.1.4	Measurement.....	3540
53.2.1.5	Data valid check.....	3540
53.2.1.6	Interrupt.....	3540
53.2.1.7	Reset.....	3540

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	53.2.1.8 Debug mode.....	3540
53.2.2	Configuration.....	3541
	53.2.2.1 TSC configurations.....	3541
	53.2.2.2 TSC-ADC-TSC analogue configuration.....	3541
	53.2.2.3 TSC, TSC analogue and ADC connection.....	3542
	53.2.2.4 TSC and GPIO.....	3542
	53.2.2.5 ADC-TSC co-working.....	3543
53.3	TSC Memory Map/Register Definition.....	3544
53.3.1	PS Input Buffer Address (TSC_BASIC_SETTING).....	3545
53.3.2	PS Input Buffer Address (TSC_PS_INPUT_BUFFER_ADDR).....	3546
53.3.3	Flow Control (TSC_FLOW_CONTROL).....	3547
53.3.4	Measure Value (TSC_MEASURE_VALUE).....	3548
53.3.5	Interrupt Enable (TSC_INT_EN).....	3549
53.3.6	Interrupt Signal Enable (TSC_INT_SIG_EN).....	3550
53.3.7	Interruption Status (TSC_INT_STATUS).....	3551
53.3.8	TSC_DEBUG_MODE.....	3553
53.3.9	TSC_DEBUG_MODE2.....	3555

## **Chapter 54 TrustZone Address Space Controller (TZASC)**

54.1	Overview.....	3559
54.2	Clocks.....	3560
54.3	Address Mapping in various memory mapping modes.....	3560

## **Chapter 55 Universal Asynchronous Receiver/Transmitter (UART)**

55.1	Overview.....	3561
55.1.1	Features.....	3562
55.1.2	Modes of operation.....	3563
55.2	External Signals.....	3563
55.2.1	Detailed Signal Descriptions.....	3568

<b>Section number</b>	<b>Title</b>	<b>Page</b>
55.2.1.1	Interrupt Signals.....	3568
55.2.1.1.1	interrupt_uart - UART Interrupt.....	3568
55.2.1.2	DMA Request Signals.....	3568
55.2.1.2.1	dma_req_rx - Receiver DMA Request.....	3568
55.2.1.2.2	dma_req_tx - Transmitter DMA Request.....	3568
55.2.1.3	Special Signals.....	3568
55.2.1.3.1	stop_req - Stop Mode.....	3568
55.2.1.3.2	doze_req - Doze Mode.....	3569
55.2.1.3.3	debug_req - Debug Mode.....	3569
55.3	Clocks.....	3569
55.4	Functional Description.....	3569
55.4.1	Interrupts and DMA Requests.....	3569
55.4.2	Clocks.....	3570
55.4.2.1	Clock requirements.....	3571
55.4.2.2	Maximum Baud Rate.....	3571
55.4.2.3	Clocking in Low-Power Modes.....	3571
55.4.3	General UART Definitions.....	3572
55.4.3.1	RTS_B - UART Request To Send.....	3573
55.4.3.2	RTS Edge Triggered Interrupt.....	3573
55.4.3.3	DTR_B - Data Terminal Ready .....	3574
55.4.3.4	DSR_B - Data Set Ready.....	3575
55.4.3.5	DTR_B/DSR_B Edge Triggered Interrupt.....	3575
55.4.3.6	DCD_B - Data Carrier Detect.....	3575
55.4.3.7	RI_B - Ring Indicator.....	3576
55.4.3.8	CTS_B - Clear To Send.....	3576
55.4.3.9	Programmable CTS_B Deassertion.....	3576
55.4.3.10	TX_DATA - UART Transmit.....	3576
55.4.3.11	RX_DATA - UART Receive.....	3577
55.4.4	Transmitter.....	3579

<b>Section number</b>	<b>Title</b>	<b>Page</b>
55.4.4.1	Transmitter FIFO Empty Interrupt Suppression.....	3579
55.4.4.2	Transmitting a Break Condition.....	3581
55.4.5	Receiver.....	3581
55.4.5.1	Idle Line Detect.....	3582
55.4.5.2	Aging Character Detect.....	3583
55.4.5.3	Receiver Wake.....	3584
55.4.5.4	Receiving a BREAK Condition.....	3585
55.4.5.5	Vote Logic.....	3585
55.4.5.6	Baud Rate Automatic Detection Logic.....	3587
55.4.5.6.1	Baud Rate Automatic Detection Protocol.....	3588
55.4.5.6.2	New Baud Rate Determination.....	3588
55.4.5.6.2.1	New Autobaud Counter Stopped bit and Interrupt.....	3589
55.4.6	Escape Sequence Detection.....	3589
55.5	Binary Rate Multiplier (BRM).....	3591
55.6	Infrared Interface.....	3593
55.6.1	Generalities-Infrared.....	3593
55.6.2	Inverted Transmission and Reception bits (INVT & INVR).....	3594
55.6.3	InfraRed Special Case (IRSC) Bit.....	3594
55.6.4	IrDA interrupt.....	3595
55.6.5	Conclusion about IrDA.....	3596
55.6.6	Programming IrDA Interface.....	3597
55.6.6.1	High Speed.....	3597
55.6.6.2	Low Speed.....	3597
55.7	9-bit RS-485 Mode.....	3598
55.7.1	Generalities.....	3598
55.7.2	Transmit 9-bit RS-485 frames.....	3599
55.7.3	Receive 9-bit RS-485 frames.....	3599
55.7.3.1	RS-485 Slave Address Normal Detect Mode.....	3599
55.7.3.2	RS-485 Slave Address Automatic Detect Mode.....	3600

<b>Section number</b>	<b>Title</b>	<b>Page</b>
55.8	Low Power Modes.....	3600
55.8.1	UART Operation in System Doze Mode.....	3601
55.8.2	UART Operation in System Stop Mode.....	3601
55.8.3	Power Saving Method in UART.....	3602
55.9	UART Operation in System Debug State.....	3602
55.10	Reset.....	3603
55.10.1	Hardware reset.....	3603
55.10.2	Software reset.....	3603
55.11	Transfer Error.....	3603
55.12	Functional Timing.....	3604
55.12.1	IrDA Mode.....	3604
55.13	Initialization.....	3604
55.13.1	Programming the UART in RS-232 mode.....	3604
55.13.2	Programming the UART in 9-bit RS-485 mode.....	3606
55.14	References.....	3607
55.15	UART Memory Map/Register Definition.....	3608
55.15.1	UART Receiver Register (UART <sub>x</sub> _URXD).....	3615
55.15.2	UART Transmitter Register (UART <sub>x</sub> _UTXD).....	3617
55.15.3	UART Control Register 1 (UART <sub>x</sub> _UCR1).....	3618
55.15.4	UART Control Register 2 (UART <sub>x</sub> _UCR2).....	3620
55.15.5	UART Control Register 3 (UART <sub>x</sub> _UCR3).....	3623
55.15.6	UART Control Register 4 (UART <sub>x</sub> _UCR4).....	3625
55.15.7	UART FIFO Control Register (UART <sub>x</sub> _UFCR).....	3627
55.15.8	UART Status Register 1 (UART <sub>x</sub> _USR1).....	3629
55.15.9	UART Status Register 2 (UART <sub>x</sub> _USR2).....	3632
55.15.10	UART Escape Character Register (UART <sub>x</sub> _UESC).....	3634
55.15.11	UART Escape Timer Register (UART <sub>x</sub> _UTIM).....	3635
55.15.12	UART BRM Incremental Register (UART <sub>x</sub> _UBIR).....	3635
55.15.13	UART BRM Modulator Register (UART <sub>x</sub> _UBMR).....	3636

<b>Section number</b>	<b>Title</b>	<b>Page</b>
55.15.14	UART Baud Rate Count Register (UART <sub>x</sub> _UBRC).....	3636
55.15.15	UART One Millisecond Register (UART <sub>x</sub> _ONEMS).....	3637
55.15.16	UART Test Register (UART <sub>x</sub> _UTS).....	3638
55.15.17	UART RS-485 Mode Control Register (UART <sub>x</sub> _UMCR).....	3639
<b>Chapter 56</b> <b>Universal Serial Bus Controller (USB)</b>		
56.1	Overview.....	3641
56.1.1	Features.....	3641
56.1.2	Modes of Operation.....	3642
56.1.2.1	Normal Mode.....	3642
56.1.2.2	Low-Power Mode.....	3643
56.2	External Signals.....	3643
56.3	Functional Description.....	3644
56.3.1	USB 2.0 Controller Core 0.....	3644
56.3.1.1	Host Mode.....	3644
56.3.1.2	Peripheral (Device) Mode.....	3645
56.3.2	USB 2.0 Controller Core 1.....	3645
56.3.3	USB Power Control.....	3645
56.3.3.1	Entering Low Power Suspend Mode.....	3645
56.3.3.2	Wake-Up Events.....	3646
56.3.3.2.1	Host Mode Events.....	3646
56.3.4	Interrupts.....	3647
56.3.4.1	USB Core Interrupts.....	3647
56.3.4.2	USB Wake-Up Interrupts.....	3647
56.4	USB Operation Model.....	3647
56.4.1	Register Interface.....	3648
56.4.1.1	Configuration, Control and Status Register Set.....	3648
56.4.1.2	Identification Registers.....	3650
56.4.1.3	OTG Operations.....	3650

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	56.4.1.3.1 Register Bits.....	3651
56.4.2	Host Data Structures.....	3652
	56.4.2.1 Periodic Frame List.....	3652
	56.4.2.2 Asynchronous List Queue Head Pointer.....	3654
	56.4.2.3 Isochronous (High-Speed) Transfer Descriptor (iTД).....	3655
	56.4.2.3.1 Next Link Pointer.....	3656
	56.4.2.3.2 iTД Transaction Status and Control List.....	3657
	56.4.2.3.3 iTД Buffer Page Pointer List (Plus).....	3658
	56.4.2.4 Split Transaction Isochronous Transfer Descriptor (siTD).....	3660
	56.4.2.4.1 Next Link Pointer.....	3660
	56.4.2.4.2 siTD Endpoint Capabilities/Characteristics.....	3661
	56.4.2.4.3 siTD Transfer State.....	3662
	56.4.2.4.4 siTD Buffer Pointer List (plus).....	3663
	56.4.2.4.5 siTD Back Link Pointer.....	3664
	56.4.2.5 Queue element transfer descriptor (qTD).....	3664
	56.4.2.5.1 Next qTD Pointer.....	3665
	56.4.2.5.2 Alternate Next qTD Pointer.....	3666
	56.4.2.5.3 qTD Token.....	3666
	56.4.2.5.4 qTD Buffer Page Pointer List.....	3669
	56.4.2.6 Queue Head.....	3670
	56.4.2.6.1 Queue Head Horizontal Link Pointer.....	3670
	56.4.2.6.2 Queue Head Endpoint Capabilities/Characteristics.....	3671
	56.4.2.6.3 Transfer Overlay-Queue Head.....	3673
	56.4.2.7 Periodic Frame Span Traversal Node (FSTN).....	3674
	56.4.2.7.1 FSTN Normal Path Pointer .....	3675
	56.4.2.7.2 FSTN Back Path Link Pointer .....	3675
56.4.3	Host Operational Model .....	3676
	56.4.3.1 Host Controller Initialization .....	3676
	56.4.3.2 Port Routing and Control.....	3678

<b>Section number</b>	<b>Title</b>	<b>Page</b>
56.4.3.2.1	Port Routing Control through EHCI Configured (CF) Bit .....	3680
56.4.3.2.2	Port Routing Control through PortOwner and Disconnect Event .....	3681
56.4.3.2.3	Example Port Routing State Machine .....	3683
56.4.3.2.3.1	EHCI HC Owner .....	3683
56.4.3.2.3.2	Companion HC Owner .....	3684
56.4.3.2.4	Port Power .....	3684
56.4.3.2.5	Port Reporting Over-Current .....	3685
56.4.3.3	Suspend/Resume-Host Operational Model .....	3686
56.4.3.3.1	Port Suspend/Resume .....	3686
56.4.3.4	Schedule Traversal Rules.....	3689
56.4.3.4.1	Example - Preserving Micro-Frame Integrity .....	3691
56.4.3.4.1.1	Transaction Fit - A Best-Fit Approximation Algorithm .....	3691
56.4.3.5	Periodic Schedule Frame Boundaries vs Bus Frame Boundaries .....	3693
56.4.3.6	Periodic Schedule .....	3696
56.4.3.7	Managing Isochronous Transfers Using iTDs .....	3698
56.4.3.7.1	Host Controller Operational Model for iTDs .....	3698
56.4.3.7.2	Software Operational Model for iTDs .....	3700
56.4.3.7.2.1	Periodic scheduling threshold.....	3702
56.4.3.8	Asynchronous Schedule .....	3703
56.4.3.8.1	Adding Queue Heads to Asynchronous Schedule.....	3704
56.4.3.8.2	Removing Queue Heads from Asynchronous Schedule .....	3705
56.4.3.8.3	Empty Asynchronous Schedule Detection .....	3707
56.4.3.8.4	Restarting Asynchronous Schedule Before EOF .....	3708
56.4.3.8.4.1	Example Method for Restarting Asynchronous Schedule Traversal .....	3709
56.4.3.8.4.2	Async Sched Not Active .....	3710
56.4.3.8.4.3	Async Sched Active .....	3710
56.4.3.8.4.4	Async Sched Sleeping .....	3711
56.4.3.8.4.5	Example Derivation for AsyncSchedSleepTime.....	3711

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	56.4.3.8.5 Asynchronous schedule traversal: Start Event.....	3711
	56.4.3.8.6 Reclamation Status Bit (USBSTS Register).....	3712
56.4.3.9	Operational Model for Nak Counter.....	3712
	56.4.3.9.1 Nak Count Reload Control .....	3714
	56.4.3.9.1.1 Wait for List Head .....	3715
	56.4.3.9.1.2 Do Reload .....	3715
	56.4.3.9.1.3 Wait for Start Event .....	3715
56.4.3.10	Managing Control/Bulk/Interrupt Transfers through Queue Heads.....	3716
	56.4.3.10.1 Fetch Queue Head .....	3718
	56.4.3.10.2 Advance Queue .....	3718
	56.4.3.10.3 Execute Transaction .....	3719
	56.4.3.10.3.1 Interrupt Transfer Pre-condition Criteria .....	3720
	56.4.3.10.3.2 Asynchronous Transfer Pre-operations and Pre-condition Criteria .....	3720
	56.4.3.10.3.3 Transfer Type Independent Pre-operations.....	3720
	56.4.3.10.3.4 Halting a Queue Head .....	3723
	56.4.3.10.3.5 Asynchronous Schedule Park Mode .....	3724
	56.4.3.10.4 Write Back qTD .....	3726
	56.4.3.10.5 Follow Queue Head Horizontal Pointer .....	3726
	56.4.3.10.6 Buffer Pointer List Use for Data Streaming with qTDs .....	3727
	56.4.3.10.7 Adding Interrupt Queue Heads to the Periodic Schedule .....	3729
	56.4.3.10.8 Managing Transfer Complete Interrupts from Queue Heads .....	3729
56.4.3.11	Ping Control.....	3730
56.4.3.12	Split Transactions.....	3731
	56.4.3.12.1 Split Transactions for Asynchronous Transfers .....	3732
	56.4.3.12.1.1 Asynchronous - Do Start Split.....	3733
	56.4.3.12.1.2 Asynchronous - Do Complete Split .....	3733
	56.4.3.12.2 Split Transaction Interrupt .....	3734
	56.4.3.12.2.1 Split Transaction Scheduling Mechanisms for Interrupt .....	3735

<b>Section number</b>	<b>Title</b>	<b>Page</b>
56.4.3.12.2.2	Host Controller Operational Model for FSTNs.....	3738
56.4.3.12.2.3	Software Operational Model for FSTNs.....	3741
56.4.3.12.2.4	Tracking Split Transaction Progress for Interrupt Transfers .	3742
56.4.3.12.2.5	Split Transaction Execution State Machine for Interrupt.....	3743
56.4.3.12.2.6	Rebalancing the periodic schedule .....	3749
56.4.3.12.3	Split Transaction Isochronous .....	3750
56.4.3.12.3.1	Split Transaction Scheduling Mechanisms for Isochronous .	3750
56.4.3.12.3.2	Tracking Split Transaction Progress for Isochronous Transfers.....	3755
56.4.3.12.3.3	Split Transaction Execution State Machine for Isochronous	3757
56.4.3.12.3.4	Periodic Isochronous - Do Start Split .....	3758
56.4.3.12.3.5	Periodic Isochronous - Do Complete Split .....	3760
56.4.3.12.3.6	Complete-Split for Scheduling Boundary Cases 2a, 2b .....	3763
56.4.3.12.3.7	Split Transaction for Isochronous - Processing Examples.....	3765
56.4.3.13	Host Controller Pause.....	3767
56.4.3.14	Port Test Modes -Host Operational Model.....	3768
56.4.3.15	Interrupts-Host Operational Model.....	3768
56.4.3.15.1	Transfer/Transaction Based Interrupts .....	3770
56.4.3.15.1.1	Transaction Error .....	3770
56.4.3.15.1.2	Serial Bus Babble.....	3770
56.4.3.15.1.3	Data Buffer Error .....	3771
56.4.3.15.1.4	USB Interrupt (Interrupt on Completion (IOC)) .....	3772
56.4.3.15.1.5	Short Packet.....	3772
56.4.3.15.2	Host Controller Event Interrupts .....	3772
56.4.3.15.2.1	Port Change Events .....	3773
56.4.3.15.2.2	Frame List Rollover .....	3773
56.4.3.15.2.3	Interrupt on Async Advance .....	3773
56.4.3.15.2.4	Host System Error .....	3773
56.4.4	EHCI Deviation.....	3774

<b>Section number</b>	<b>Title</b>	<b>Page</b>
56.4.4.1	Embedded Transaction Translator Function.....	3775
56.4.4.1.1	Capability Registers.....	3775
56.4.4.1.2	Operational Registers.....	3776
56.4.4.1.3	Discovery-EHCI Deviation.....	3776
56.4.4.1.4	Data Structures.....	3776
56.4.4.1.5	Operational Model.....	3777
56.4.4.1.5.1	Micro-frame Pipeline.....	3777
56.4.4.1.5.2	Split State Machines.....	3778
56.4.4.1.5.3	Asynchronous Transaction Scheduling and Buffer Management.....	3779

## **Chapter 57** **Universal Serial Bus 2.0 Integrated PHY (USB-PHY)**

57.1	USB PHY Overview.....	3901
57.2	Operation.....	3901
57.2.1	UTMI.....	3901
57.2.2	Digital Transmitter.....	3902
57.2.3	Digital Receiver.....	3902
57.2.4	Analog Receiver.....	3902
57.2.4.1	HS Differential Receiver.....	3903
57.2.4.2	Squelch Detector.....	3904
57.2.4.3	LS/FS Differential Receiver.....	3904
57.2.4.4	HS Disconnect Detector.....	3904
57.2.4.5	USB Plugged-In Detector.....	3904
57.2.4.6	Single-Ended USB_DP Receiver.....	3905
57.2.4.7	Single-Ended USB_DN Receiver.....	3905
57.2.4.8	9X Oversample Module.....	3905
57.2.5	Analog Transmitter.....	3905
57.2.5.1	Switchable High-Speed 45Ω Termination Resistors.....	3905
57.2.5.2	Low-Speed/Full-Speed Differential Driver.....	3906
57.2.5.3	High-Speed Differential Driver.....	3906
57.2.5.4	Switchable 1.5KΩ USB_DP Pullup Resistor.....	3906
57.2.5.5	Switchable 15KΩ USB_DP Pulldown Resistor.....	3906

<b>Section number</b>	<b>Title</b>	<b>Page</b>
57.2.6	Recommended Register Configuration for USB Certification.....	3908
57.2.7	Charger detection.....	3908
57.2.7.1	Charger detect control table.....	3908
57.2.7.2	Data pin contact detector.....	3908
57.2.7.3	Charger detector.....	3909
57.2.7.4	Charger detection software flow.....	3909
57.2.7.5	Dead Battery Protect.....	3911
57.3	USB PHY Memory Map/Register Definition.....	3911
57.3.1	USB PHY Power-Down Register (USBPHY $x$ _PWD $n$ ).....	3914
57.3.2	USB PHY Transmitter Control Register (USBPHY $x$ _TX $n$ ).....	3916
57.3.3	USB PHY Receiver Control Register (USBPHY $x$ _RX $n$ ).....	3917
57.3.4	USB PHY General Control Register (USBPHY $x$ _CTRL $n$ ).....	3919
57.3.5	USB PHY Status Register (USBPHY $x$ _STATUS).....	3922
57.3.6	USB PHY Debug Register (USBPHY $x$ _DEBUG $n$ ).....	3924
57.3.7	UTMI Debug Status Register 0 (USBPHY $x$ _DEBUG0_STATUS).....	3926
57.3.8	UTMI Debug Status Register 1 (USBPHY $x$ _DEBUG1 $n$ ).....	3927
57.3.9	UTMI RTL Version (USBPHY $x$ _VERSION).....	3928
57.4	USB Analog Memory Map/Register Definition.....	3928
57.4.1	USB_VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECT $n$ ).....	3930
57.4.2	USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECT $n$ ).....	3931
57.4.3	USB_VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT).....	3933
57.4.4	USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT).....	3935
57.4.5	USB Misc Register (USB_ANALOG_USB1_MISC $n$ ).....	3936
57.4.6	USB_VBUS Detect Register (USB_ANALOG_USB2_VBUS_DETECT $n$ ).....	3937
57.4.7	USB Charger Detect Register (USB_ANALOG_USB2_CHRG_DETECT $n$ ).....	3939
57.4.8	USB_VBUS Detect Status Register (USB_ANALOG_USB2_VBUS_DETECT_STAT).....	3941
57.4.9	USB Charger Detect Status Register (USB_ANALOG_USB2_CHRG_DETECT_STAT).....	3943
57.4.10	USB Misc Register (USB_ANALOG_USB2_MISC $n$ ).....	3944
57.4.11	Chip Silicon Version (USB_ANALOG_DIGPROG).....	3945

	<b>Chapter 58 Ultra Secured Digital Host Controller (uSDHC)</b>	
58.1	Overview.....	3947
58.1.1	Features.....	3950
58.1.2	Modes and Operations.....	3951
58.1.2.1	Data Transfer Modes.....	3951
58.2	External Signals.....	3951
58.2.1	Signals Overview.....	3953
58.3	Clocks.....	3954
58.4	Functional Description.....	3954
58.4.1	Data Buffer.....	3954
58.4.1.1	Write Operation Sequence.....	3957
58.4.1.2	Read Operation Sequence.....	3957
58.4.1.3	Data Buffer and Block Size.....	3958
58.4.1.4	Dividing Large Data Transfer.....	3959
58.4.1.5	External DMA Request.....	3960
58.4.2	DMA AHB Interface.....	3961
58.4.2.1	Internal DMA Request.....	3962
58.4.2.2	DMA Burst Length.....	3963
58.4.2.3	AHB Master Interface.....	3963
58.4.2.4	ADMA Engine.....	3963
58.4.2.4.1	ADMA Concept and Descriptor Format.....	3964
58.4.2.4.2	ADMA Interrupt.....	3968
58.4.2.4.3	ADMA Error.....	3969
58.4.3	Register Bank with IP Bus Interface.....	3969
58.4.3.1	SD Protocol Unit.....	3970
58.4.3.2	SD control misc.....	3971
58.4.3.3	SD Clock control.....	3971
58.4.3.4	Command control.....	3971

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	58.4.3.5 Data control.....	3972
58.4.4	Clock & Reset Manager.....	3972
58.4.5	Clock Generator.....	3973
58.4.6	SDIO Card Interrupt.....	3973
	58.4.6.1 Interrupts in 1-bit Mode.....	3973
	58.4.6.2 Interrupt in 4-bit Mode.....	3973
	58.4.6.3 Card Interrupt Handling.....	3974
58.4.7	Card Insertion and Removal Detection.....	3975
58.4.8	Power Management and Wake Up Events.....	3976
	58.4.8.1 Setting Wake Up Events.....	3977
58.4.9	MMC fast boot.....	3977
	58.4.9.1 Boot operation.....	3977
	58.4.9.2 Alternative boot operation.....	3978
58.5	Initialization/Application of uSDHC.....	3979
58.5.1	Command Send & Response Receive Basic Operation.....	3979
58.5.2	Card Identification Mode.....	3980
	58.5.2.1 Card Detect.....	3980
	58.5.2.2 Reset.....	3981
	58.5.2.3 Voltage Validation.....	3982
	58.5.2.4 Card Registry.....	3984
58.5.3	Card Access.....	3985
	58.5.3.1 Block Write.....	3985
	58.5.3.1.1 Normal Write.....	3985
	58.5.3.1.2 DDR Write.....	3987
	58.5.3.1.3 Write with Pause.....	3987
	58.5.3.2 Block Read.....	3989
	58.5.3.2.1 Normal Read.....	3989
	58.5.3.2.2 DDR Read.....	3990

# **Chapter 1**

## **Introduction**

### **1.1 About This Document**

The i.MX 6ULL application processors are NXP's latest additions to a growing family of real-time processing products offering high-performance processing optimized for lowest power consumption.

The i.MX 6ULL processors feature NXP's advanced implementation of the ARM® Cortex®-A7 core.

The processors can be interfaced with DDR3, DDR3L LPDDR2 (single channel) DRAM memory devices.

These products are suitable for applications such as:

- eReaders
- General embedded devices
- Industrial devices

#### **1.1.1 Audience**

This manual is intended for the board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands the concepts of the digital system design, microprocessor architecture, Input/Output (I/O) devices, industry standard communication, and device interface protocols.

## 1.1.2 Organization

This document covers the chip at a system level and provides an architectural overview. It also covers the system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

## 1.1.3 Suggested Reading

This section lists the additional resources that provide background for the information in this manual, as well as general information about the architecture.

### 1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex processor.

For information about the ARM Cortex processor see:

- <http://infocenter.arm.com>

### 1.1.3.2 Related Documentation

NXP documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.nxp.com>.

## 1.1.4 Conventions

This document uses the following notational conventions:

**cleared / set**

When a bit has a value of zero, it is said to be cleared; when it has a value of one, it is said to be set.

**mnemonics**

Instruction mnemonics are shown in lowercase bold.

**italics**

Italics indicate variable command parameters, for example, **bcctrx**.

The book titles in the text are set in italics.

**15**

An integer in decimal.

**0x**

the prefix to denote a hexadecimal number.

**0b**

The prefix to denote a binary number. Binary values of 0 and 1 are written without a prefix.

**n'H4000CA00**

The n-bit hexadecimal number.

**BLK\_REG\_NAME**

The register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (\_).

**BLK\_REG[FIELD]**

The fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

**BLK\_REG[ n ]**

The bit number *n* within the BLK.REG register.

**BLK\_REG[ l:r ]**

The register bit ranges. The ranges are indicated by the left-most bit number *l* and the right-most bit number *r*, separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

**x, U**

In some contexts, such as signal encodings, an unitalicized x indicates a "don't care" or "uninitialized". The binary value can be 1 or 0.

**x**

An italicized x indicates an alphanumeric variable.

**n, m**

Italicized *n* or *m* represent integer variables.

**!**

Binary logic operator NOT.

**&&**

Binary logic operator AND.

**||**

Binary logic operator OR.

**^ or <O+>**

Binary logic operator XOR. For example, A <O+> B.

**|**

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value of 0b1001.

**&**

Bit-wise AND. For example, 0b0001 and 0b1000 yields the value of 0b0000.

**{A,B}**

Concatenation, where the  $n$ -bit value A is prepended to the  $m$ -bit value B to form an  $(n+m)$ -bit value. For example, {0, REGm [14:0]} yeilds a 16-bit value with 0 in the most significant bit.

**- or grey fill**

Indicates a reserved bit field in a register. Although these bits can be written to with ones or zeros, they always read zeros.

&gt;&gt;

Shift right logical one position.

&lt;&lt;

Shift left logical one position.

&lt;=

Assignment.

==

Compare equal.

!=

Compare not equal.

&gt;

Greater than.

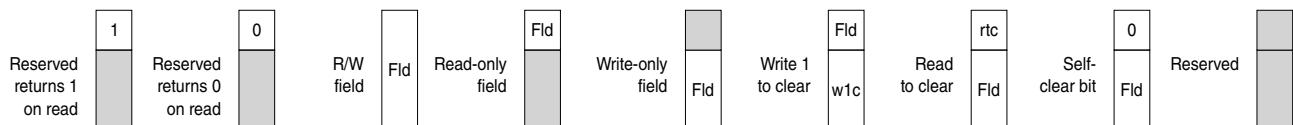

&lt;

Less than.

## 1.1.5 Register Access

### 1.1.5.1 Register Diagram Field Access Type Legend

This figure provides the interpretation of the notation used in the register diagrams for a number of common field access types:

**Figure 1-1. Register Field Conventions**

#### NOTE

For reserved register fields, the software should mask off the data in the field after a read (the software can't rely on the contents of data read from a reserved field) and always write all zeros.

### 1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all the bits set to 1 perform the associated operation on the primary register, while the bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one-bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read-modify-write operations. When an atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

A set of SCT registers is offered for registers in many modules on this device, as described in this manual. In a module memory map table, the suffix \_SET, \_CLR, or \_TOG is added to the base name of the register. For example, the CCM\_ANALOG\_PLL\_ARM register has three other registers called CCM\_ANALOG\_PLL\_ARM\_SET, CCM\_ANALOG\_PLL\_ARM\_CLR, and CCM\_ANALOG\_PLL\_ARM\_TOG.

## About This Document

In the sub-section that describes one of these sets of registers, a short-hand convention is used to denote that a register has the SCT register set. There is an italicized *n* appended to the end of the short register name. Using the above example, the name used for this register is CCM\_ANALOG\_PLL\_ARM*n*. When you see this designation, there is a SCT register set associated with the register, and you can verify this by checking it in the memory map table. The address offset for each of these registers is given in the form of the following example:

Address: 20C\_8000h base + 0h offset + (4d × i), where i=0d to 3d

In this example, the address for each of the base registers and their three SCT registers can be calculated as:

Register	Address
CCM_ANALOG_PLL_ARM	20C_8000h
CCM_ANALOG_PLL_ARM_SET	20C_8004h
CCM_ANALOG_PLL_ARM_CLR	20C_8008h
CCM_ANALOG_PLL_ARM_TOG	20C_800Ch

## 1.1.6 Signal Conventions

### b, B

When appended to a signal name, this indicates that a signal is active-low.

### NEG\_ACTIVE

Overbar also denotes a negative active signal.

### UPPERCASE

Package pin names, Block I/O signals.

### lowercase

Lowercase is used to indicate internal signals.

## 1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

### Acronyms and Abbreviated Terms

Term	Meaning
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	Arm IP Bus
ALU	Arithmetic Logic Unit

*Table continues on the next page...*

Term	Meaning
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BEE	Bus Encrypt Engine
BIST	Built-In Self Test
CA/CM	Arm Cortex-A/Cortex-M
CAAM	Cryptographic Acceleration and Assurance Module
CAN	Controller Area Network
CCM	Clock Controller Module
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
ECSPI	Enhanced Configurable SPI
EIM	External Interface Module
ENET	Ethernet
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable Programmable Read-Only Memory
ETF	Embedded Trace FIFO
ETM	Embedded Trace Macrocell
FIFO	First-In-First-Out
GIC	General Interrupt Controller
GPC	General Power Controller
GPIO	General-Purpose I/O
GPR	General-Purpose Register
GPS	Global Positioning System
GPT	General-Purpose Timer
GPU	Graphics Processing Unit
GPV	Global Programmers View
HAB	High-Assurance Boot
I <sup>2</sup> C or I <sup>2</sup> C	Inter-Integrated Circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IOMUX	Input-Output Multiplexer

Table continues on the next page...

## About This Document

Term	Meaning
IP	Intellectual Property
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LDO	Low-Dropout
LIFO	Last-In-First-Out
LRU	Least-Recently Used
LSB	Least-Significant Byte
LUT	Look-Up Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MMC	Multimedia Card
MMDC	Multi Mode DDR Controller
MSB	Most-Significant Byte
MT/s	Mega Transfers per second
OCRAM	On-Chip Random-Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCI	Peripheral Component Interconnect
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable Interrupt Controller
PMU	Power Management Unit
POR	Power-On Reset
PSRAM	Pseudo-Static Random Access Memory
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced Instruction Set Computing
ROM	Read-Only Memory
ROMCP	ROM Controller with Patch
RTOS	Real-Time Operating System
Rx	Receive
SAI	Synchronous Audio Interface
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous Data Link Control
SDMA	Smart DMA
SIM	Subscriber Identification Module
SNVS	Secure Non-Volatile Storage

*Table continues on the next page...*

Term	Meaning
SoC	System-on-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Phillips Digital Interface
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory
SRC	System Reset Controller
TFT	Thin-Film Transistor
TPIU	Trace Port Interface
TSGEN	Time Stamp Generator
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

## 1.2 Introduction

This chapter introduces the architecture of the i.MX 6ULL Multimedia Applications Processors. The i.MX 6ULL processors represent NXP's latest achievement in integrated multimedia applications processors.

It is part of a growing i.MX family of multimedia-focused products, offering high-performance processing optimized for the lowest power consumption.

## 1.3 Target Applications

The architecture's flexibility enables it to be used in a wide variety of general embedded applications. The i.MX 6ULL processor provides all interfaces necessary to connect peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

## 1.4 Features

The i.MX 6ULL processors are based on ARM® Cortex®-A7 MPCore™ Platform, which has these features:

- Single ARM Cortex-A7 MPCore (with TrustZone) with:
  - 32 KB L1 instruction cache
  - 32 KB L1 data cache
  - Cortex-A7 NEON MPE (Media Processing Engine) co-processor

The ARM Cortex-A7 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupts support
- Global Timer
- Snoop Control Unit (SCU)
- 128 KB unified I/D L2 cache
- Single Master AXI (128-bit) bus interface output of L2 cache
- NEON MPE co-processor
  - SIMD Media Processing Architecture
  - NEON register file with 32x32-bit, 32x64-bit, and 16x128-bit general-purpose registers
  - NEON Integer execute pipeline (ALU, Shift, MAC)
  - NEON dual, single-precision floating-point execute pipeline (FADD, FMUL)
  - NEON load/store and permute pipeline
  - Supports single- and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations, as described in the ARM VFPv4 architecture.
  - Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats.

The target frequency of the core is 528 MHz non-overdrive and overdrive to 800 MHz for industrial processor and 900 MHz for consumer processor over the specified temperature range.

The i.MX 6ULL processors support high-volume, cost-effective handheld DRAM, NOR flash, and SD memory card standards.

The memory system consists of these components:

- Level 1 cache—32 KB instruction, 32 KB data cache
- Level 2 cache—unified instruction and data (128 KB)
- On-Chip Memory:
  - Boot ROM, including High-Assurance Boot (HAB, 96 KB)
  - Internal fast access RAM (OCRAM, 128 KB)
- External memory interfaces:
  - 16-bit LP-DDR2, 16-bit DDR3-400, and LV-DDR3-400
  - 8-bit NAND-flash, including support for Raw MLC/TLC, 2 KB ,4 KB, and 8 KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™, and others
  - BCH ECC up to 40 bits
  - 16-bit NOR flash

- 16-bit PSRAM, Cellular RAM
- Dual-channel/single-channel QuadSPI flash

The i.MX 6ULL processor enables these interfaces to external devices (some of them are muxed and not available simultaneously):

Displays:

- LCDIF—supports one parallel 24-bit LCD display with up to WXGA (1366 x 768) resolution at 60 Hz
- EPDC—supports direct-driver for E-Ink EPD panels with resolution up to 2048 x 1536 at 106 Hz (or 4096 x 4096 at 20 Hz)
  - Supports up to 64 LUT for concurrent updates
  - Supports Auto-Waveform selection based on both the input image and current panel content
  - Supports collision detection
  - Supports both the PVI panels and LGD GIP panels

Camera sensors:

- One parallel camera port (up to 24-bit and 66 MHz)

Expansion cards: four MMC/SD/SDIO card ports that support:

- 1-bit or 4-bit transfer mode specifications for the SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for the MMC cards up to 52 MHz in both the SDR and DDR modes (104 MB/s max)
- Compatible with SD, miniSD, SDIO, miniSDIO, SD Combo, MMC and MMC RS, embedded MMC, and embedded SD cards.
- Host-clock frequency variable from 32 kHz to 52 MHz
- Up to 200 Mbit/s data transfer for SD/SDIO cards using four parallel data lines
- Up to 416 Mbit/s data transfer for MMC cards using eight parallel data lines
- Up to 832 Mbit/s data transfer for MMC/SD cards using eight parallel data lines in the DDR mode

USB:

- Two High-Speed (HS) USB 2.0 OTG (up to 480 Mbit/s), with integrated HS USB PHY

Miscellaneous IPs and interfaces:

- Three I<sup>2</sup>S/SAI/AC97, each operating at up to 1.4 Mbit/s
- ESAI
- Eight UARTs (each operating at up to 5.0 Mbit/s) that provide the RS232 interface and support 9-bit RS485 multidrop mode. Eight UARTs that support the 4-wire mode.

## Features

- Four eCSPI (enhanced CSPI), three of them support up to 52 M-bit/s, one can be of low speed
- Four I<sup>2</sup>Cs supporting 400 kbit/s
- Dual-megabit Ethernet controller (IEEE1588-compliant), 10/100 Mbit/s
- Eight Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)
- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Controller Area Network (FlexCAN), 1 Mbit/s each
- Three Watchdog timers (WDOG)
- Asynchronous Sample Rate Converter (ASRC)
- Medium Quality Sound (MQS)

The i.MX 6ULL processors integrate the advanced Power Management Unit (PMU) and these controllers:

- The PMU includes multiple LDO supplies for on-chip resources
- Temperature Sensor to monitor the die temperature
- DVFS to support low-power modes
- Software State Retention and Power Gating for ARM and MPE
- Multiple power modes
- Flexible clock-gating control scheme

The use of hardware accelerators is a key factor in obtaining high performance at low power consumption levels, while keeping the CPU core relatively free for performing other tasks.

The i.MX 6ULL processors incorporate this hardware accelerator:

- Pixel Processing Pipeline (PXP)

The security functions are enabled and accelerated by this hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, and so on)
- SJC—System JTAG Controller—protects the JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- SNVS—Secure Non-Volatile Storage, including Secure Real-Time Clock.
- CSU—Central Security Unit—an enhancement for the IC Identification Module (IIM). It is configured during boot and by the eFUSES, and determines the security level operation mode and the TZ policy.
- RNGB—True Random Number Generation
- A-HAB—Advanced High-Assurance Boot—HABv4 with these new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

**NOTE**

The actual feature set depends on the part number.

## 1.5 Architectural Overview

This section contains details about the chip architecture.

### 1.5.1 Simplified Block Diagram

A high-level block diagram is shown in the following figure. This diagram provides a view of the chip's major sub-systems (processor domains, shared peripherals domain, and memories) and logical connectivity.

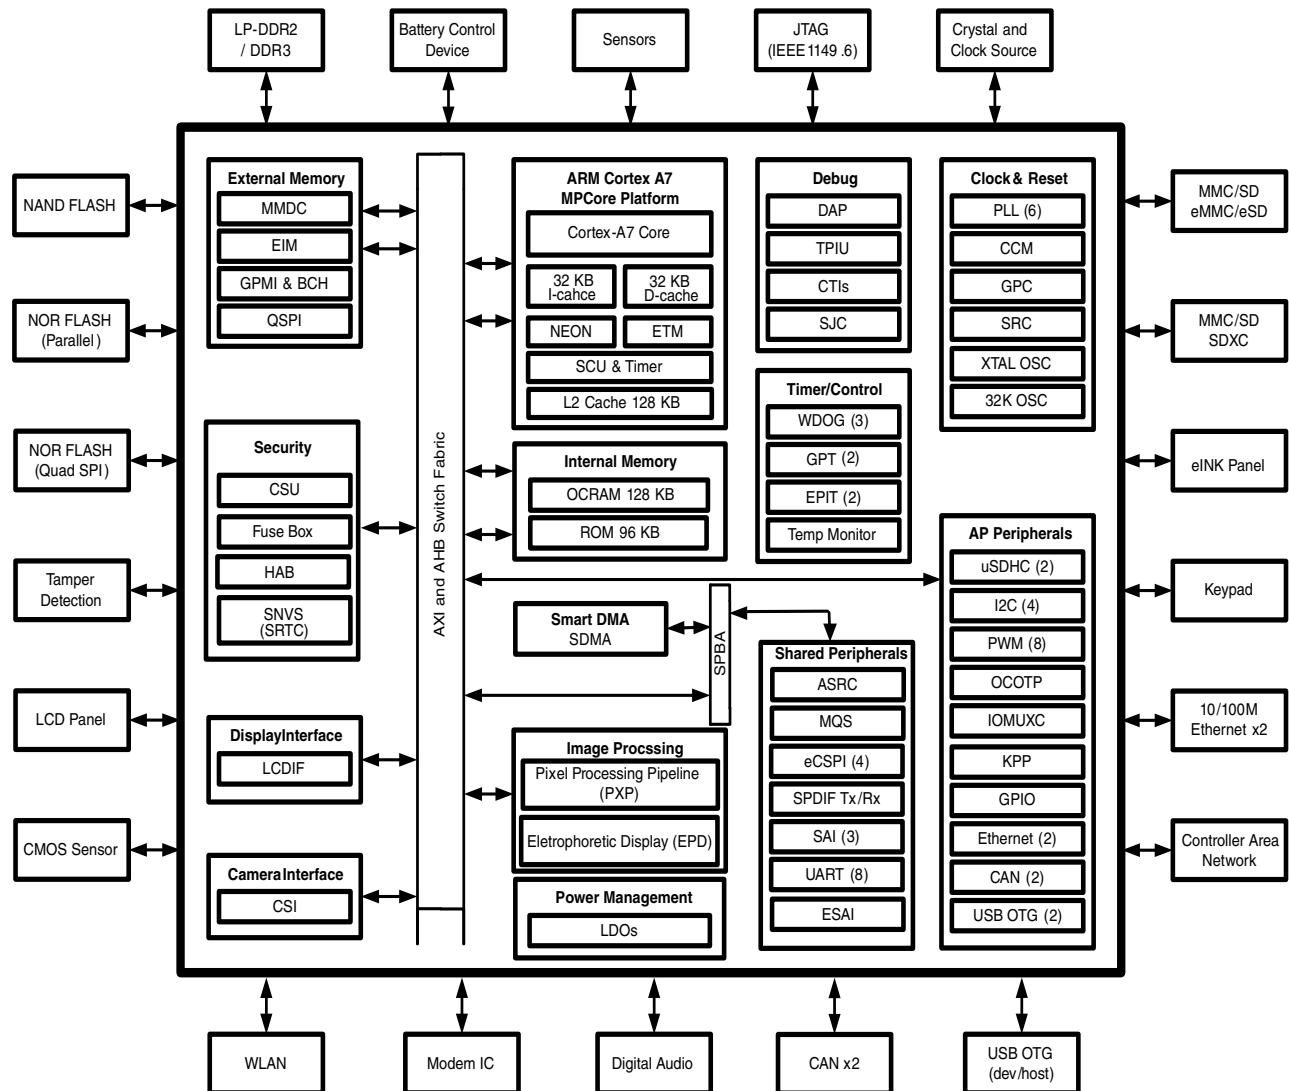

Figure 1-2. Simplified block diagram

## 1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A7 MPCore™ Platform provides hardware features for:
  - Operating System
  - User applications (including control over hardware accelerators and non-accelerated functions)
  - TrustZone applications

- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:
  - Clock Control Module (CCM)
  - XTALOSC- 24 MHz Crystal oscillator source support
  - OSC32KHz - 32.768 Hz Crystal oscillator source support
  - System Reset Controller (SRC)
  - General Power Controller (GPC)
  - Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
  - Audio
    - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
    - SPDIF Tx/Rx
    - Audio sample rate conversion accelerator (ASRC)
    - ESDI
  - Video
    - Display/graphics
    - Pixel Pipeline (PXP)
    - LCD interface (LCDIF)
    - CMOS sensor interface
    - EPDC
- Security is supported by:
  - High Assurance Boot (HAB4) System
  - ARM TrustZone (TZ) Trusted Execution environment
  - Peripheral access policy control, using Central Security Unit (CSU)
  - DCP and SNVS security architecture, providing:
    - Security State Controller
    - Encryption and Hashing functions, Random Number Generator (RNGB)
    - Security Violation/Tamper Detection & Reporting
  - System JTAG controller (SJC)
  - Secure Real Time Clock (SRTC)
  - TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and External Memory Interfaces:
  - Embedded DMAs
  - 3.3V IO voltage for seamless integration
  - Two USB 2.0 ports, including two PHYs: 2x HS-USB (OTG)
  - Nand-Flash (MLC up to 40-bit ECC) and NOR Flash memory interface via GPMI Nand-Flash controller

- Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A7 MPCore™ platform.
- Miscellaneous connectivity support - FLEXCAN, MMC/SD, I2C, SPI, UART, PWM and Keypad interface

### **1.5.3 Endianness Support**

The chip supports only the Little Endian mode.

### **1.5.4 Memory Interfaces**

The chip DDR controller supports these memory interfaces:

The EIM block provides an interface for SRAM and PSRAM, and a 16/8-bit NOR flash. All EIM pins are muxed on other interfaces.

# Chapter 2

## Memory Maps

### 2.1 Memory system overview

This section introduces the memory architecture of the chip.

### 2.2 ARM Platform Memory Map

The chip memory map has been provided in the following tables.

**Table 2-1. System memory map**

Start address	End address	Size	Description
8000_0000	FFFF_FFFF	2048 MB	MMDC—x16 DDR Controller.
7000_0000	7FFF_FFFF	256 MB	Reserved
6000_0000	6FFF_FFFF	256 MB	QSPI1 Memory
5800_0000	5FFF_FFFF	128 MB	EIM Aliased
5000_0000	57FF_FFFF	128 MB	EIM (NOR/SRAM)
1000_0000	4FFF_FFFF	1024 MB	Reserved
0E00_0000	0FFF_FFFF	32 MB	Reserved
0C00_0000	0DFF_FFFF	32 MB	QSPI1 Rx Buffer
0900_0000	0BFF_FFFF	48 MB	Reserved
0800_0000	08FF_FFFF	16 MB	Reserved
02C0_0000	07FF_FFFF	84 MB	Reserved
0230_0000	02BF_FFFF	9 MB	Reserved
0220_0000	022F_FFFF	1 MB	<a href="#">Table 2-4</a> AIPS-3. See IP listing on the separate map.
0210_0000	021F_FFFF	1 MB	<a href="#">Table 2-3</a> AIPS-2. See the IP listing on the separate map.
0200_0000	020F_FFFF	1 MB	<a href="#">Table 2-2</a> AIPS-1. See the IP listing on the separate map.
0181_0000	01FF_FFFF	8128 KB	Reserved
0180_C000	0180_FFFF	16 KB	Reserved

Reserved	0xE000	4 KB
SPBA Registers	0xF000	4 KB

**NOTE**

Accessing the reserved memory regions can result in an unpredictable behavior.

# Chapter 3

## Interrupts and DMA Events

### 3.1 Overview

This section describes the assignments of interrupts from the ARM domain in [Cortex A7 interrupts](#) and from the DMA events in [SDMA event mapping](#).

### 3.2 Cortex A7 interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all chip sources and provides an interface to the Cortex A7 CPU. The first 32 interrupts are private to the CPUs' interface. These interrupts are not included in the table below. All interrupts besides those private to the CPU are hooked up to the GPC.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. This table describes the ARM Cortex A7 interrupt sources:

**Table 3-1. ARM Cortex A7 domain interrupt summary**

IRQ	Interrupt Source	LOGIC	Interrupt Description
0	boot	-	Used to notify cores on exception condition while boot
1	ca7_platform	-	DAP
2	sdma	-	AND of all 48 SDMA interrupts (events) from all the channels
3	tsc	-	TSC interrupt
4	snvs_lp_wrapper	OR	ON-OFF button press shorter than 5 secs (pulse event)
	snvs_hp_wrapper		ON-OFF button press shorter than 5 secs (pulse event)
5	lcdif	-	LCDIF Sync Interrupt
6	rngb	-	RNGB Interrupt
7	csi	-	CSI interrupt
8	pfp	-	PFP interrupt
9	sctr	-	SCTR compare interrupt

*Table continues on the next page...*

**Table 3-1. ARM Cortex A7 domain interrupt summary (continued)**

IRQ	Interrupt Source	LOGIC	Interrupt Description
10	sctr	-	SCTR compare interrupt
11	wdog3	-	Watchdog Timer reset
12	-	-	Reserved
13	apbhdma	OR	GPMI operation channel 0 description complete interrupt
			GPMI operation channel 1 description complete interrupt
			GPMI operation channel 2 description complete interrupt
			GPMI operation channel 3 description complete interrupt
14	weim	-	WEIM interrupt
15	bch	-	BCH operation complete interrupt
16	gpmi	-	GPMI operation TIMEOUT ERROR interrupt
17	uart6	-	UART-6 ORed interrupt
18	pxp	-	PXP interrupt
19	snvs_hp_wrapper	-	SRTC Consolidated Interrupt. Non TZ.
20	snvs_hp_wrapper	-	SRTC Security Interrupt. TZ.
21	csu	-	CSU Interrupt Request 1. Indicates to the processor that one or more alarm inputs were asserted
22	usdhc1	-	uSDHC1 Enhanced SDHC Interrupt Request
23	usdhc2	-	uSDHC2 Enhanced SDHC Interrupt Request
24	sai3	-	SAI interrupt
25	sai3	-	SAI interrupt
26	uart1	-	UART-1 ORed interrupt
27	uart2	-	UART-2 ORed interrupt
28	uart3	-	UART-3 ORed interrupt
29	uart4	-	UART-4 ORed interrupt
30	uart5	-	UART-5 ORed interrupt
31	ecspi1	-	eCSPI1 interrupt request line to the core.
32	ecspi2	-	eCSPI2 interrupt request line to the core.
33	ecspi3	-	eCSPI3 interrupt request line to the core.
34	ecspi4	-	eCSPI4 interrupt request line to the core.
35	i2c4	-	I2C-4 Interrupt
36	i2c1	-	I2C-1 Interrupt
37	i2c2	-	I2C-2 Interrupt
38	i2c3	-	I2C-3 Interrupt
39	uart7	-	UART-7 ORed interrupt
40	uart8	-	UART-8 ORed interrupt
41	-	-	Reserved
42	usb	-	USBO2 USB OTG2
43	usb	-	USBO2 USB OTG1
44	anatop	-	USBPHY (UTMIO), Interrupt
45	anatop	-	USBPHY (UTMI1), Interrupt

*Table continues on the next page...*

**Table 3-1. ARM Cortex A7 domain interrupt summary (continued)**

IRQ	Interrupt Source	LOGIC	Interrupt Description
46	dcp	-	DCP Interrupt
47	dcp	-	DCP Interrupt
48	dcp	-	DCP Interrupt
49	tempsensor	OR	TempSensor low
			TempSensor high
			TempSensor panic
50	asrc	-	ASRC- Interrupt for core
51	esai	-	ESAI interrupt
52	spdif	OR	SPDIF Rx interrupt
	spdif		SPDIF Tx interrupt
53	-	-	Reserved
54	pmu	-	Brown-out event on either the 1.1, 2.5 or 3.0 regulators.
55	gpt1	-	OR of GPT1 Rollover interrupt line, Input Capture 1 & 2 lines, Output Compare 1,2 &3 Interrupt lines
56	epit1	-	EPIT1 output compare interrupt
57	epit2	-	EPIT2 output compare interrupt
58	gpio1	-	Active HIGH Interrupt from INT7 from GPIO
59	gpio1	-	Active HIGH Interrupt from INT6 from GPIO
60	gpio1	-	Active HIGH Interrupt from INT5 from GPIO
61	gpio1	-	Active HIGH Interrupt from INT4 from GPIO
62	gpio1	-	Active HIGH Interrupt from INT3 from GPIO
63	gpio1	-	Active HIGH Interrupt from INT2 from GPIO
64	gpio1	-	Active HIGH Interrupt from INT1 from GPIO
65	gpio1	-	Active HIGH Interrupt from INT0 from GPIO
66	gpio1	-	Combined interrupt indication for GPIO1 signal 0 throughout 15
67	gpio1	-	Combined interrupt indication for GPIO1 signal 16 throughout 31
68	gpio2	-	Combined interrupt indication for GPIO2 signal 0 throughout 15
69	gpio2	-	Combined interrupt indication for GPIO2 signal 16 throughout 31
70	gpio3	-	Combined interrupt indication for GPIO3 signal 0 throughout 15
71	gpio3	-	Combined interrupt indication for GPIO3 signal 16 throughout 31
72	gpio4	-	Combined interrupt indication for GPIO4 signal 0 throughout 15
73	gpio4	-	Combined interrupt indication for GPIO4 signal 16 throughout 31
74	gpio5	-	Combined interrupt indication for GPIO5 signal 0 throughout 15

*Table continues on the next page...*

**Table 3-1. ARM Cortex A7 domain interrupt summary (continued)**

IRQ	Interrupt Source	LOGIC	Interrupt Description
75	gpio5	-	Combined interrupt indication for GPIO5 signal 16 throughout 31
76	can1	-	IPI compare interrupt
77	can2	-	IPI compare interrupt
78	-	-	Reserved
79	-	-	Reserved
80	wdog1	-	Watchdog Timer reset
81	wdog2	-	Watchdog Timer reset
82	kpp	-	Keypad Interrupt
83	pwm1	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
84	pwm2	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
85	pwm3	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
86	pwm4	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
87	ccm	-	CCM, Interrupt Request 1
88	ccm	-	CCM, Interrupt Request 2
89	gpc	-	GPC, Interrupt Request 1
90	-	-	Reserved
91	src	-	SRC interrupt request
92	-	-	Reserved
93	-	-	Reserved
94	ca7_platform	-	Performance Unit Interrupts from ca7_mx6ul (internally: nPMUIRQ[0])
95	ca7_platform	-	CTI trigger outputs (internal: nCTIIRQ[0])
96	src	-	Combined CPU wdog interrupts (4x) out of SRC.
97	sai1	OR	SAI interrupt
			SAI interrupt
			SAI interrupt
			SAI interrupt
98	sai2	OR	SAI interrupt
			SAI interrupt
			SAI interrupt
			SAI interrupt
99	-	-	Reserved
100	adc1	OR	ADC1 interrupt

*Table continues on the next page...*

**Table 3-1. ARM Cortex A7 domain interrupt summary (continued)**

IRQ	Interrupt Source	LOGIC	Interrupt Description
			ADC1 interrupt
101	adc2	OR	ADC2 interrupt
			ADC2 interrupt
102	-	-	Reserved
103	-	-	Reserved
104	sjc	-	SJC Interrupt from General Purpose register.
105	caam_wrapper	-	CAAM interrupt queue for JQ0
106	caam_wrapper	-	CAAM interrupt queue for JQ1
107	qspi	-	QuadSPI interrupt
108	tzasc	-	TZASC #1 (PL380) interrupt
109	gpt2	-	OR of GPT2 Rollover interrupt line, Input Capture 1 & 2 lines, Output Compare 1,2 &3 Interrupt lines
110	can1	-	Combined interrupt of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
111	can2	-	Combined interrupt of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
112	epdc	-	epdc interrupt
113	-	-	Reserved
114	pwm5	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
115	pwm6	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
116	pwm7	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
117	pwm8	-	Cumulative interrupt line. OR of Rollover Interrupt line, Compare Interrupt line and FIFO Waterlevel crossing interrupt line
118	enet1	OR	MAC 0 Periodic Timer Overflow MAC 0 Time Stamp Available MAC 0 Payload Receive Error MAC 0 Transmit FIFO Underrun MAC 0 Collision Retry Limit MAC 0 Late Collision MAC 0 Ethernet Bus Error MAC 0 MII Data Transfer Done MAC 0 Receive Buffer Done MAC 0 Receive Frame Done MAC 0 Transmit Buffer Done

*Table continues on the next page...*

**Table 3-1. ARM Cortex A7 domain interrupt summary (continued)**

IRQ	Interrupt Source	LOGIC	Interrupt Description
			MAC 0 Transmit Frame Done MAC 0 Graceful Stop MAC 0 Babbling Transmit Error MAC 0 Babbling Receive Error MAC 0 Wakeup Request (sync)
119	enet1	-	MAC 0 1588 Timer Interrupt – synchronous
120	enet2	OR	MAC 0 Periodic Timer Overflow MAC 0 Time Stamp Available MAC 0 Payload Receive Error MAC 0 Transmit FIFO Underrun MAC 0 Collision Retry Limit MAC 0 Late Collision MAC 0 Ethernet Bus Error MAC 0 MII Data Transfer Done MAC 0 Receive Buffer Done MAC 0 Receive Frame Done MAC 0 Transmit Buffer Done MAC 0 Transmit Frame Done MAC 0 Graceful Stop MAC 0 Babbling Transmit Error MAC 0 Babbling Receive Error MAC 0 Wakeup Request (sync)
121	enet2	-	MAC 0 1588 Timer Interrupt – synchronous
122	-	-	Reserved
123	-	-	Reserved
124	-	-	Reserved
125	-	-	Reserved
126	-	-	Reserved
127	pmu	-	Brown out event on either the core, gpu or soc regulators

### 3.3 SDMA event mapping

This table shows the DMA request signals for the peripherals in the chip:

**Table 3-2. SDMA event mapping**

Event Number	DMA Source	Description
0	UART6 / ESAI	UAR6 Rx FIFO; ESAI Rx FIFO DMA request
1	ADC1	ADC1 DMA request
2	EPIT2 / PXP	EPIT2 DMA request; PXP DMA Event
3	eCSPI1	eCSPI1 Rx request
4	eCSPI1	eCSPI1 Tx request
5	eCSPI2	eCSPI2 Rx request
6	eCSPI2	eCSPI2 Tx request
7	eCSPI3 / I2C1	eCSPI3 Rx request; I2C1 DMA event
8	eCSPI3 / I2C2	eCSPI3 Tx request; I2C2 DMA event
9	eCSPI4 / I2C3	eCSPI4 Rx request; I2C3 DMA event
10	eCSPI4 / I2C4	eCSPI4 Tx request; I2C4 DMA event
11	QSPI	QSPI DMA RX request
12	QSPI	QSPI DMA TX request
13	ADC2 / TSC	ADC2 DMA request; TSC interrupt
14	Mux_bottom	external DMA pad #1
15	Mux_bottom	external DMA pad #2
16	EPIT1 / CSI	EPIT1 DMA request: CSI DMA Event
17	ASRC	ASRC DMA1 request (Pair A input Request)
18	ASRC	ASRC DMA2 request (Pair B input Request)
19	ASRC	ASRC DMA3 request (Pair C input Request)
20	ASRC	ASRC DMA4 request (Pair A output Request)
21	ASRC	ASRC DMA5 request (Pair B output Request)
22	ASRC	ASRC DMA6 request (Pair C output Request)
23	GPT1	GPT1 counter event
24	GPT2 / LCDIF	GPT2 counter event; LCDIF DMA Event
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3	UART3 Rx FIFO
30	UART3	UART3 Tx FIFO
31	UART4	UART4 Rx FIFO
32	UART4	UART4 Tx FIFO
33	UART5	UART5 Rx FIFO
34	UART5 / EPDC	UART5 Tx FIFO; EPDC DMA request
35	SAI1	SAI1 Rx FIFO
36	SAI1	SAI1 Tx FIFO

*Table continues on the next page...*

**Table 3-2. SDMA event mapping (continued)**

Event Number	DMA Source	Description
39	SAI3	SAI3 Rx FIFO
40	SAI3	SAI3 Rx FIFO
41	SPDIF	SPDIF Rx DMA request
42	SPDIF	SPDIF Tx DMA request
43	UART7 / ENET1	UART7 Rx FIFO; ENET1 1588 Event0 out
44	UART7 / ENET1	UART7 Tx FIFO; ENET1 1588 Event1 out
45	UART8 / ENET2	UART8 Rx FIFO; ENET2 1588 Event0 out
46	UART8 / ENET2	UART8 Tx FIFO; ENET2 1588 Event1 out
47	UART6 / ESAI	UART6 Tx FIFO; ESAI Tx FIFO DMA request

As shown in the table, some of the events are the output of a mux of two signals or triggers. The selection of this mux is controlled by the general-purpose registers in IOMUXC.

# Chapter 4

## External Signals and Pin Multiplexing

### 4.1 Overview

The chip contains a limited number of pins, most of which have multiple signal options. These signal-to-pin and pin-to-signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

The muxing options table lists the external signals grouped by the module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

#### 4.1.1 Muxing Options

# Chapter 5

## Fusemap

### 5.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by `BOOT_CFG1[6:4]` fuses listed in [Table 5-1](#).

**Table 5-1. Boot Device Select**

Boot Device	BOOT_CF G1[7]	BOOT_CF G1[6]	BOOT_CF G1[5]	BOOT_CF G1[4]	BOOT_CF G1[3]	BOOT_CF G1[2]	BOOT_CF G1[1]	BOOT_CF G1[0]
QSPI	0	0	0	1	0 - QSPI0	DDRSMP: 000 - Default 001 - 111	DDRSMP: 000 - Default 001 - 111	DDRSMP: 000 - Default 001 - 111
WEIM	0	0	0	0	Memory Type: 0 - NOR Flash 1 - OneNAND	Reserved	Reserved	Reserved
Serial-ROM	0	0	1	1	Reserved	Reserved	Reserved	Reserved
SD/eSD	0	1	0	Fast boot: 0 - Regular 1 - Fast boot	SD/SDXC speed: 00 - Normal/ SDR12 01 - High/ SDR25 10 - SDR50 11 - SDR104	SD/SDXC speed: 00 - Normal/ SDR12 01 - High/ SDR25 10 - SDR50 11 - SDR104	SD power cycle enable: 0 - No power cycle 1 - Enabled via USDHC_RS T pad (uSDHC3 and 4 only)	SD loopback clock source sel ( for SDR50 and SDR104 only): 0 - Through SD pad 1 - Direct

*Table continues on the next page...*

**Table 5-1. Boot Device Select (continued)**

Boot Device	BOOT_CF G1[7]	BOOT_CF G1[6]	BOOT_CF G1[5]	BOOT_CF G1[4]	BOOT_CF G1[3]	BOOT_CF G1[2]	BOOT_CF G1[1]	BOOT_CF G1[0]
MMC/eMMC	0	1	1	Fast boot: 0 - Regular 1 - Fast boot	SD/MMC speed: 0 - Normal 1 - High	Fast boot acknowledge disable: 0 - Boot ack enabled 1 - Boot ack disabled	SD power cycle enable: 0 - No power cycle 1 - Enabled via USDHC_RS T pad (uSDHC3 and 4 only)	SD loopback clock source sel ( for SDR50 and SDR104 only): 0 - Through SD pad 1 - Direct

**NOTE**

Fuses marked as “Reserved” are reserved for NXP internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

# Chapter 6

## External Memory Controllers

### 6.1 Overview

This chip has these external memory interfaces and controllers:

- Multi-Mode DDR Controller (MMDC)
- EIM-PSRAM/NOR flash controller

### 6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that supports several types of DDR memories.

**Table 6-1. MMDC feature summary**

Feature	Description
Supported standards	<ul style="list-style-type: none"><li>• LPDDR2 1ch x16, LV-DDR3, DDR3 x16</li></ul>
DDR interface	<ul style="list-style-type: none"><li>• Density of 256 MB-4 GB<ul style="list-style-type: none"><li>• Column size of 8-12 bits</li><li>• Row size of 11-16 bits</li></ul></li><li>• Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2</li></ul>
DDR performance	<ul style="list-style-type: none"><li>• Supports Real-Time priority by means of QoS the sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism</li><li>• Page hit/page miss optimizations</li><li>• Consecutive read/write access optimizations</li><li>• Supports deep read and write requests queues to enable bank prediction</li><li>• Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed)</li><li>• Can track open memory pages</li><li>• Supports bank interleaving</li><li>• Special optimization for non-aligned wrap accesses in burst length 8</li></ul>
AXI interface	<ul style="list-style-type: none"><li>• AXI bus compliant with glueless interface to PL301 AXI network interconnect</li></ul>

**Table 6-1. MMDC feature summary (continued)**

Feature	Description
DDR calibration and delay-lines	<ul style="list-style-type: none"> <li>All calibrations can be done automatically by hardware or manually by software.</li> <li>ZQ calibration for an external DDR device (in DDR3 through the ZQ calibration command and in LPDDR2 through the MRW command).           <ul style="list-style-type: none"> <li>Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh).</li> <li>Can be handled manually at ZQ INIT.</li> </ul> </li> </ul>
DDR general	<ul style="list-style-type: none"> <li>Configurable timing parameters</li> <li>Configurable refresh scheme</li> <li>Supports dynamic voltage, frequency change, and low-power mode entry through hardware negotiation with the system (req/ack handshake)</li> <li>Supports automatic self-refresh and power down entry and exit</li> <li>Supports the fast and slow precharge power down in DDR3</li> <li>Supports various ODT control schemes.           <ul style="list-style-type: none"> <li>Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS</li> </ul> </li> <li>Supports MRW and MRR commands for LPDDR2</li> <li>Software control for moving to derated timing parameters and derated refresh rate according to the temperature variation.</li> <li>Supports various debug and profiling modes</li> </ul>

## 6.3 EIM-PSRAM/NOR flash controller overview

EIM is an external interface module that manages the interface to external chip devices, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

### 6.3.1 EIM features

- Up to four (software configurable) chip selects for external devices
  - Flexible address decoding; each chip-select memory space is determined separately according to the GPR bits in IOMUXC.
  - Maximum supported density is 128 MB by default (AUS bit is cleared). When the AUS bit is set, the maximum supported density is 32 MB.
- Selectable write protection for each chip select
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals

- Independent synchronous memory burst write mode support for PSRAM and NOR-flash memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Supports NAND-flash devices with a NOR-flash interfaces - OneNAND™ (Samsung)
- Independent programmable variable/fix latency support for read and write synchronous (burst) mode
- Support for little-endian operation
- ARM AXI slave interface accesses are only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY\_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY\_INT signal
  - RDY signal support assertion after reset
  - INT signal support assertion after reset for OneNAND™ (Samsung) device
  - Supports little-endian mode only

### 6.3.2 EIM boot scenarios

EIM allows booting from NOR-flash devices. To select the NOR flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See [System Boot](#) for more information.

### 6.3.3 EIM boot configuration

This table shows the EIM boot configuration:

**Table 6-2. EIM boot configuration**

EIM_BOOT_CFG bus	EIM affected bits	EIM register
12	NUM16_BYP_GRANT	CS0GCR2
11	DSZ[2]	CS0GCR1
10	AUS	CS0GCR1
[9:8]	CSREC[2:1]	CS0GCR1
[7:5]	RWSC[4:2] WWSC[4:2]	CS0GCR1 CS0WCR
4	ERRST	WCR
3	RAL	CS0RCR1

*Table continues on the next page...*

**Table 6-2. EIM boot configuration (continued)**

EIM_BOOT_CFG bus	EIM affected bits	EIM register
	WAL	CS0WCR
2	MUM	CS0GCR1
	OEA[1]	CS0RCR1
[1:0]	DSZ[1:0]	CS0GCR1

### 6.3.4 OneNAND requirements

By default, the Ready/Busy pin is not in use, perform these steps to configure the OneNAND:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the OneNAND device to any GPIO pin and use it as an interrupt that indicates the OneNAND device ready state.

# **Chapter 7**

## **System Debug**

### **7.1 Overview**

This section describes the hardware and software debug and application development features and resources of the chip. It describes the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM CoreSight architecture, adapted to SoC (for core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with core under the debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third-party tools
- TPIU, a trace port interface unit that efficiently accesses the program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

### **7.2 Chip and ARM Platform Debug Architecture**

The ARM Debug architecture is based on the CoreSight architecture by ARM. The CoreSight architecture provides a system-wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form the CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access the debug functionality without software interaction
- To connect to a running system without performing a reset

Full access to the processor debug capability is available by the ARM debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state, and restarts the processor core.

## 7.2.1 Debug Features

- CoreSight Embedded Trace Macrocell (ETM): trace generator for ARM processors
- Support for a TrustZone-related 3-level debug scheme:
  - Debug in Non-Secure privileged and user, and Secure user
  - Debug in Non-Secure only
- EmbeddedICE-RT logic
  - Support for both the monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core-mapped and memory-mapped resource examination/modification
- Data communication channel between the ARM core and the host debugger via JTAG and the Debug Access Port (DAP) module
- PMU (Performance Metrics Unit) used for system profiling and debug
- CP15 register for debugging the MMU, I and D L1 cache, and TLB

The chip includes ARM CoreSight components for multicore debug and trace solutions.

## 7.2.2 Debug system components

The CoreSight components include:

- Embedded Trace Buffer (ETB): RAM array to be used for on-chip capture of trace data output from the PTM
- ATB Replicator to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- Cross Triggering logic for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility which selects critical signals routed to the I/O pads as alternate outputs for external visibility

### 7.2.2.1 AMBA Trace Bus (ATB)

ATB transfers trace data through the chip CoreSight infrastructure. The trace sources are ATB masters and the sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both the master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine the sources into a single trace stream
- Association of the trace data with the generating source using trace source IDs. The CoreSight system can trace up to 111 different items at any time
- Capture and transfer of multiple byte bus widths, currently to 32 bits
- A flushing mechanism to force the historic trace to drain from any sources, links, or sinks up to the point that the request is initiated

### 7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—the ATB replicator accepts the trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—the ATB replicator sends identical trace data on the outgoing master port interfaces.

### 7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate the debug state information from one core to another, so that the program execution can be stopped on both processors at the same time (if required).

The ECT consists of these types of modules:

- Cross Trigger Interfaces (CTI)
- Cross Trigger Matrix (CTM)

The cross trigger interfaces provide the interface between the component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event, it maps it onto a trigger output. This enables the subsystems to cross trigger with each other. The reception and transmission of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger requests generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides the Channel Interfaces (CIs) to connect to either the CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a software-controlled debug signal matrix that receives signals from various sources (cores and peripherals) and propagates/routes them to the different debug resources of the SoC. These debug resources include the time-stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

#### **NOTE**

Because the ECT should only be used during the debug sessions, it is disabled by default.

#### 7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross-Trigger Matrix) is provided by ARM. A brief description is provided below. See the ARM documentation for more details.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in the ARM platform.

One of them is used to route Core's CTI's, while the second one is used for the additional CoreSight CTIs. Each CTI has four channel lines, to which the CTI events are mapped. The exact mapping is configured in the CTI logic.

### 7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are CTIs in the chip's ARM platform. of which, dedicated to , while the is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see [ARM platform chapter](#).

### 7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access though AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
  - AHB Access Port (AHB-AP)
  - APB Access Port (APB-AP)
  - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

## 7.2.3 Chip-Specific SJC Features

### 7.2.3.1 JTAG Disable Mode

In addition to different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

### 7.2.3.2 JTAG ID

**Table 7-1. i.MX JTAG ID**

Device	Silicon revision	JTAG ID
i.MX 6ULL	Rev 1.0	0891_E01Dh <sup>1</sup>

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891\_E01Dh for Rev 1.1, 2891\_E01Dh for Rev 1.2 , etc.

## 7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

#### **NOTE**

Single Wire Debug (SWD) protocol is not supported.

### **7.2.5 System JTAG controller main features**

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- levels of security, ranging from no security to no JTAG accessibility to the chip

### **7.2.6 SJC TAP Port**

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

### **7.2.7 SJC main blocks**

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug\_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
  - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
  - Optional: "ID\_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC

- The ExtraDebug registers, which implement a variety of control and status features
  - Three 32-bit insecure general purpose status registers
  - Two 32-bit secure status registers - one predefined, one general purpose.
  - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined control and status functions are supported by the SJC.

## 7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

### NOTE

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
  - SDMA core control - run/halt/single-step
  - SDMA core register/memory-map access
  - Event detection, watchpoints, and hardware breakpoints
  - Real time buffer and PC trace buffer capability
- Trace buffer
  - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump
  - Includes information about all the channel dump activity
  - Current contents of SDMA RAM
- ROMPATCH

### 7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- Memory And Register Access - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- Event Detection Unit - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- Watchpoints - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- Hardware Breakpoint - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- Real Time Buffer - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- Core Control (Core Status / Single Stepping) - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- Trace Buffer - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

### 7.3.1.1 Other SDMA Debug Functionality

- Core Trace - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- ROM Patch - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- Additional debug control/status interaction with the SJC module
  - SJC-controlled Debug Request
  - SJC-readable Debug Acknowledge (in debug mode)
  - Debug clock control - allows SJC to force clocks on for debug purposes
  - Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

### 7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE\_AFTER\_RESET mode. A debug request also puts the SDMA in its DEBUG\_IN\_IDLE\_AFTER\_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the exec\_core <instruction> SDMA OnCE instruction to return to the IDLE\_AFTER\_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

## 7.4 Miscellaneous

The Miscellaneous function described in this section provide useful general capabilities.

### 7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A7 core can receive resets from the following sources:

- Debug Reset (CDBGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

## 7.5 Supported tools

DS-5 ARM Debugger is supported.

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

# Chapter 8

## System Boot

### 8.1 Overview

The boot process begins at the Power-On Reset (POR) where the hardware reset logic forces the Arm core to begin the execution starting from the on-chip boot ROM.

The boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG and UART)
- Device Configuration Data (DCD) and plugin
- Digital signature and encryption based High-Assurance Boot (HAB)
- Wake-up from the low-power modes

The boot ROM supports these boot devices:

- NOR flash
- NAND flash
- OneNAND flash
- SD/MMC
- Serial (SPI) NOR flash and EEPROM
- QuadSPI (QSPI) flash

The boot ROM uses the state of the `BOOT_MODE` and eFUSES to determine the boot device. For development purposes, the eFUSES used to determine the boot device may be overridden using the GPIO pin inputs.

The boot ROM code also allows to download the programs to be run on the device. The example is a provisioning program that can make further use of the serial connection to provide a boot device with a new image. Typically, the provisioning program is

## Boot modes

downloaded to the internal RAM and allows to program the boot devices, such as the SD/MMC flash. The ROM serial downloader uses a high-speed USB in a non-stream mode connection and the UART in a stream mode connection.

The boot ROM allows waking up from the low-power modes. On reset, the ROM checks the power gating status register. When waking from the low-power mode, the core skips loading an image from the boot device and jumps to the address saved in PERSISTENT\_ENTRY0.

The Device Configuration Data (DCD) feature allows the boot ROM code to obtain the SOC configuration data from an external program image residing on the boot device. As an example, the DCD can be used to program the DDR controller for optimal settings, improving the boot performance. The DCD is restricted to the memory areas and peripheral addresses that are considered essential for the boot purposes (see [Write data command](#)).

A key feature of the boot ROM is the ability to perform a secure boot, also known as a High-Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. The HAB uses a combination of hardware and software together with the Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows the user image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as a part of the final program image. If configured to do so, the ROM verifies the signatures using the public keys included in the program image. In addition to supporting the digital signature verification to authenticate the program images, the encrypted boot is also supported. The encrypted boot can be used to prevent the cloning of the program image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the serial downloader. The HAB library in the boot ROM also provides the API functions, allowing the additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for the SEC\_CONFIG is the open configuration, in which the ROM/HAB performs the image authentication, but all authentication errors are ignored and the image is still allowed to execute.

## 8.2 Boot modes

During reset, the chip checks the power gating controller status register.

During boot, the core's behavior is defined by the boot mode pin settings, as described in [Boot mode pin settings](#). When waking up from the low-power boot mode, the core skips the clock settings. The boot ROM checks that the PERSISTENT\_ENTRY0 (see

**Persistent bits**) is a pointer to a valid address space (OCRAM, DDR, QSPI, or EIM). If the PERSISTENT\_ENTRY0 is a pointer to a valid range, it starts the execution using the entry point from the PERSISTENT\_ENTRY0 register. If the PERSISTENT\_ENTRY0 is a pointer to an invalid range, the core performs the system reset.

### 8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for NXP use). The boot mode is selected based on the binary value stored in the internal BOOT\_MODE register.

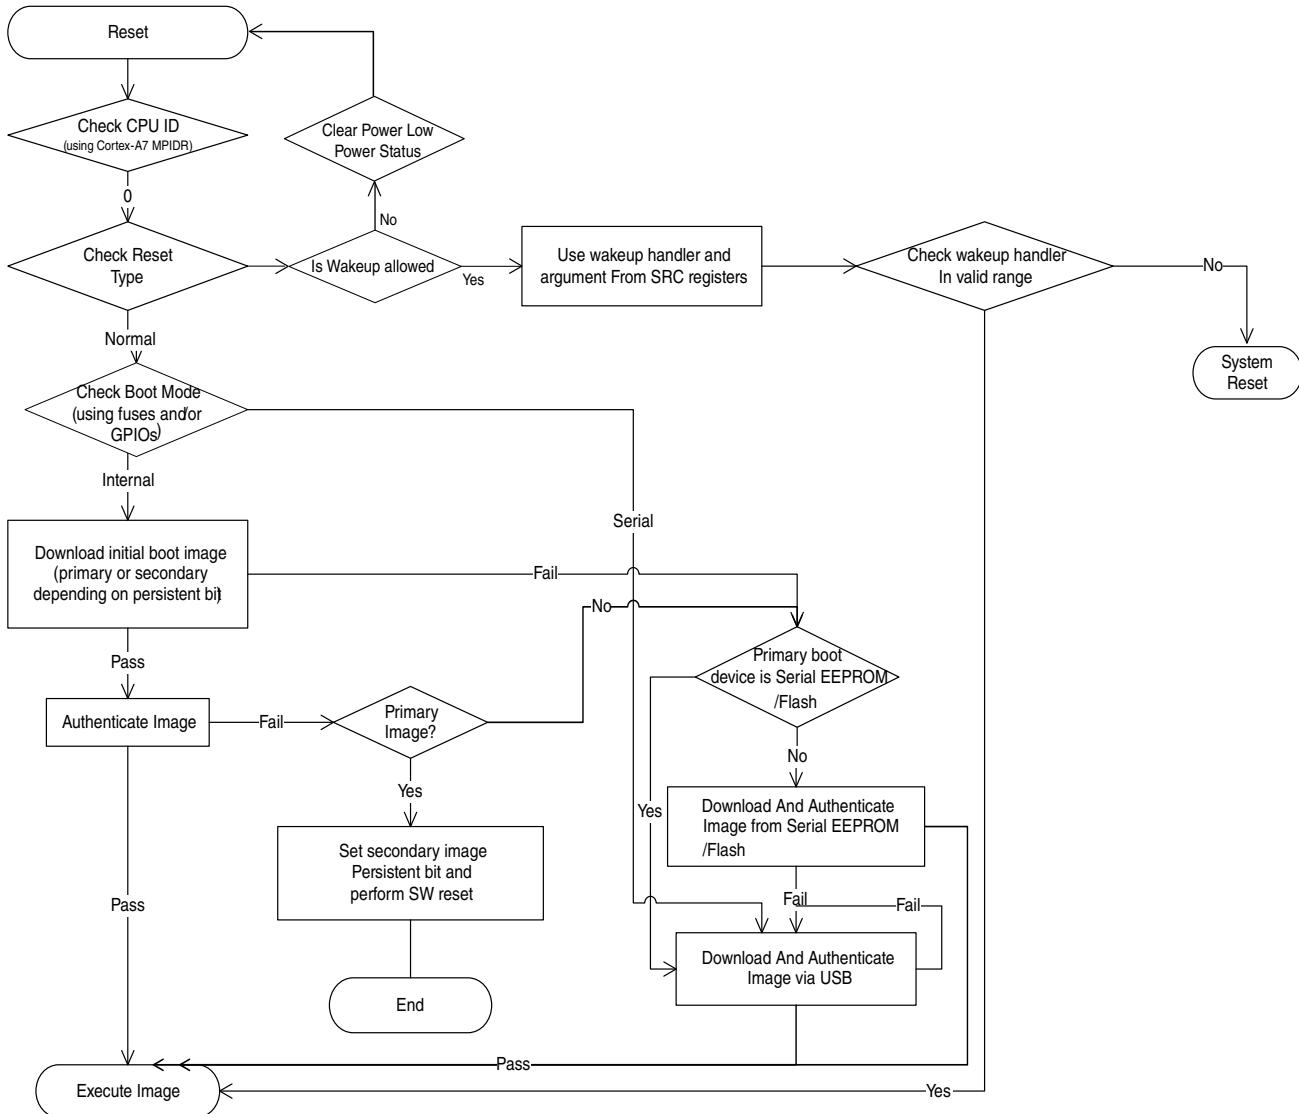

The BOOT\_MODE is initialized by sampling the BOOT\_MODE0 and BOOT\_MODE1 inputs on the rising edge of the POR\_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT\_MODE internal register. The state of the internal BOOT\_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC\_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See this table for settings:

**Table 8-1. Boot MODE pin settings**

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

## 8.2.2 High-level boot sequence

The figure found here show the high-level boot ROM code flow.

**Figure 8-1. Boot flow**

## 8.2.3 Boot From Fuses mode (BOOT\_MODE[1:0] = 00b)

A value of 00b in the BOOT\_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot mode \(BOOT\\_MODE\[1:0\] = 0b10\)](#) with one difference. In this mode, the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT\_FUSE\_SEL eFUSE value. If BT\_FUSE\_SEL = 0, indicating that the boot device (for example, flash, SD/MMC) was not programmed yet, the boot flow jumps directly to the Serial Downloader. If BT\_FUSE\_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using the Boot From Fuses mode addresses this problem.

Setting the BT\_FUSE\_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a program image and blow the BT\_FUSE\_SEL and the other boot configuration eFUSES. After the reset, the boot ROM code determines that the BT\_FUSE\_SEL is blown (BT\_FUSE\_SEL = 1) and the ROM code performs an internal boot according to the new eFUSE settings. This allows the user to set BOOT\_MODE[1:0]=00b on a production device and burn the fuses on the same device (by forcing the entry to the Serial Downloader), without changing the value of the BOOT\_MODE[1:0] or the pullups/pulldowns on the BOOT\_MODE pins.

## 8.2.4 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB and UART serial connection.

In this mode, the ROM programs the WDOG1 for a time-out specified by the fuse WDOG Time-out Select (See fusemap for details) if the WDOG\_ENABLE eFuse is 1 and continuously polls for the USB and UART connection. If no activity is found on the USB OTG1 and UART 1/2 and the watchdog timer expires, the Arm core is reset.

### NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB and UART boot flow:

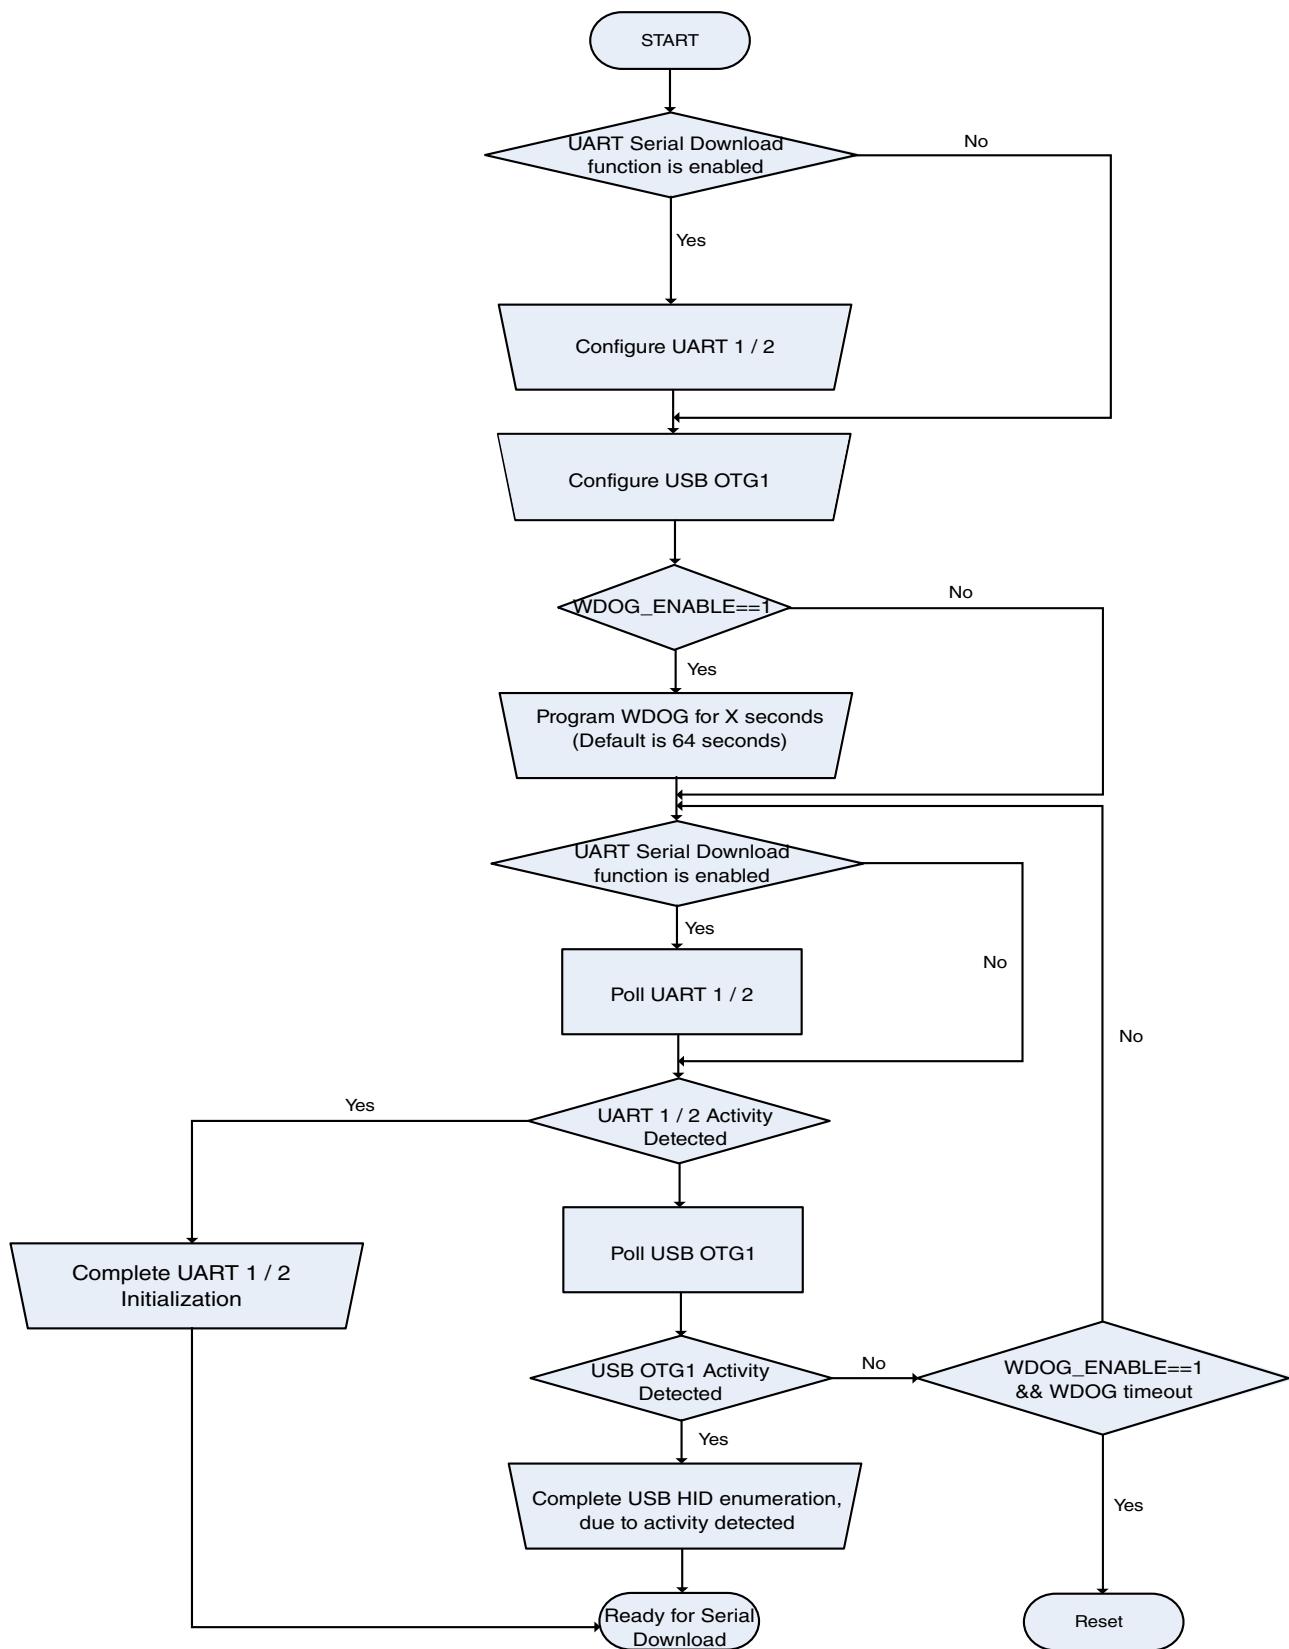

Figure 8-2. Serial Downloader boot flow

### 8.2.5 Internal Boot mode (BOOT\_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT\_MODE[1:0] register selects the Internal Boot mode. In this mode, the processor continues to execute the boot code from the internal boot ROM.

The boot code performs the hardware initialization, loads the program image from the chosen boot device, performs the image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the program image. If an error occurs during the internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to the Internal Boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using the General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT\_FUSE\_SEL) determines whether the ROM uses the GPIO pins for a selected number of configuration parameters or eFUSES in this mode.

- If BT\_FUSE\_SEL = 1, all boot options are controlled by the eFUSES described in [Table 8-2](#).
- If BT\_FUSE\_SEL = 0, the specific boot configuration parameters may be set using the GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 8-2](#). [Table 8-3](#) provides the details of the GPIO pins.

The use of the GPIO overrides is intended for development since these pads are used for other purposes in the deployed products. NXP recommends controlling the boot configuration by the eFUSES in the deployed products and reserving the use of the GPIO mode for the development and testing purposes only.

### 8.2.6 Boot security settings

The internal boot modes use one of three security configurations.

- Closed: This level is intended for use with shipping-secure products. All HAB functions are executed and the security hardware is initialized (the Security Controller or SNVS enters the Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, and the boot flow is aborted with the control being passed to the serial downloader. At this level, the execution does not leave the internal ROM unless the target executable image is authenticated.

- Open: This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. The security hardware is initialized (except for the SNVS which is left in the Non-Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, but have no influence on the boot flow which continues as if the errors did not occur. This configuration is useful for a secure product development because the program image runs even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of the authentication failure.
- Field Return: This level is intended for the parts returned from the shipped products.

## 8.3 Device configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes the boot device selection (SPI, EIM, NOR, SD, MMC, QSPI, and so on), boot device configuration (SD bus width, speed, and so on), and other. In general, the source for this configuration comes from the eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from the GPIO pins, allowing further flexibility during the development process.

### 8.3.1 Boot eFUSE descriptions

This table is a comprehensive list of the configuration parameters that the ROM uses.

**Table 8-2. Boot eFUSE descriptions**

Fuse	Config uratio n	Definition	GPIO <sup>1</sup>	Shipped value	Settings <sup>2</sup>
DIR_BT_DIS	OEM	Disables the NXP reserved modes.	NA	0	0—The reserved NXP modes are enabled. 1—The reserved NXP modes are disabled. This fuse must be blown to 1 for normal operation.
BT_FUSE_SEL	OEM	In the Internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by the GPIO pins	NA	0	If BOOT_MODE[1:0] = 0b10: <ul style="list-style-type: none"><li>0—The bits of the SBMR are overridden by the GPIO pins.</li><li>1—The specific bits of the SBMR are controlled by the eFUSE settings.</li></ul> If BOOT_MODE[1:0] = 0b00

*Table continues on the next page...*

**Table 8-2. Boot eFUSE descriptions  
(continued)**

Fuse	Config uratio n	Definition	GPIO <sup>1</sup>	Shipped value	Settings <sup>2</sup>
		or the eFUSE settings in the On-Chip OTP Controller (OCOTP).  In the Boot From Fuse mode BOOT_MODE[1:0] = 00, the BT_FUSE_SEL fuse indicates whether the bit configuration eFuses are programmed.			<ul style="list-style-type: none"> <li>0—The BOOT configuration eFuses are not programmed yet. The boot flow jumps to the serial downloader.</li> <li>1—The BOOT configuration eFuses are programmed. The regular boot flow is performed.</li> </ul>
SEC_CONFIG[1:0]	SEC_C ONFIG[ 0] - NXP  SEC_C ONFIG[ 1] - OEM	Security Configuration, as defined in <a href="#">Boot security settings</a>	NA	01	00—Reserved 01—Open (allows any program image, even if the authentication fails) 1x—Closed (The program image executes only if authenticated)

1. This setting can be overridden by the GPIO settings when the BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse

### 8.3.2 GPIO boot overrides

This table provides a list of the GPIO boot overrides:

**Table 8-3. GPIO override contact assignments**

Package pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot mode selection
BOOT_MODE0	Input	

*Table continues on the next page...*

**Table 8-3. GPIO override contact assignments (continued)**

Package pin	Direction on reset	eFuse
LCD1_DATA00	Input	BOOT_CFG1[0]
LCD1_DATA01	Input	BOOT_CFG1[1]
LCD1_DATA02	Input	BOOT_CFG1[2]
LCD1_DATA03	Input	BOOT_CFG1[3]
LCD1_DATA04	Input	BOOT_CFG1[4]
LCD1_DATA05	Input	BOOT_CFG1[5]
LCD1_DATA06	Input	BOOT_CFG1[6]
LCD1_DATA07	Input	BOOT_CFG1[7]
LCD1_DATA08	Input	BOOT_CFG2[0]
LCD1_DATA09	Input	BOOT_CFG2[1]
LCD1_DATA10	Input	BOOT_CFG2[2]
LCD1_DATA11	Input	BOOT_CFG2[3]
LCD1_DATA12	Input	BOOT_CFG2[4]
LCD1_DATA13	Input	BOOT_CFG2[5]
LCD1_DATA14	Input	BOOT_CFG2[6]
LCD1_DATA15	Input	BOOT_CFG2[7]
LCD1_DATA16	Input	BOOT_CFG4[0]
LCD1_DATA17	Input	BOOT_CFG4[1]
LCD1_DATA18	Input	BOOT_CFG4[2]
LCD1_DATA19	Input	BOOT_CFG4[3]
LCD1_DATA20	Input	BOOT_CFG4[4]
LCD1_DATA21	Input	BOOT_CFG4[5]
LCD1_DATA22	Input	BOOT_CFG4[6]
LCD1_DATA23	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override the corresponding eFUSE values, depending on the setting of the BT\_FUSE\_SEL fuse.

### 8.3.3 Device Configuration Data (DCD)

The DCD is the configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on DCD.

## 8.4 Device initialization

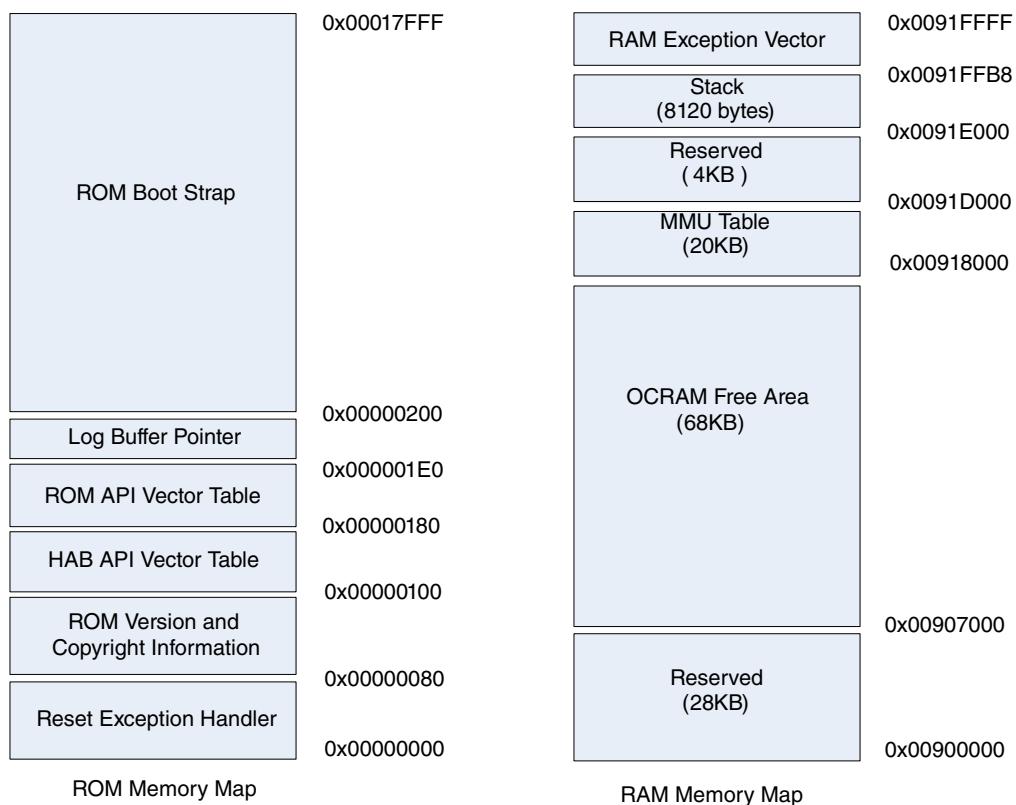

This section describes the details of the ROM and provides the initialization details.

This includes details on:

- The ROM memory map
- The RAM memory map
- On-chip blocks that the ROM must use or change the POR register default values
- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

### 8.4.1 Internal ROM/RAM memory map

These figures show the iROM memory map:

**Figure 8-3. Internal ROM and RAM memory map**

#### NOTE

The entire OCRAM region can be used freely after the boot.

## 8.4.2 Boot block activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in an alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and the boot device selection:

- APBH—the DMA engine to drive the GPMI module
- BCH—40-bit error correction hardware engine with the AXI bus master and a private connection to the GPMI
- CCM—Clock Control Module
- ECSPI—Enhanced Configurable Serial Peripheral Interface
- EIM—External Interface Module used for the NOR and OneNAND devices
- GPMI—NAND controller pin interface
- OCOTP\_CTRL—On-Chip OTP Controller; the OCOTP contains the eFUSES
- IOMUXC—I/O Multiplexer Control which allows the GPIO use to override the eFUSE boot settings;
- IOMUXC GPR—I/O Multiplexer Control General-Purpose Registers
- DCP—Data Co-Processor
- QSPI—QuadSPI flash
- SNVS—Secure Non-Volatile Storage
- SRC—System Reset Controller
- UART—Universal Asynchronous Receiver/Transmitter controller
- USB—used for the serial download of a boot device provisioning program
- USDHC—Ultra-Secure Digital Host Controller
- WDOG-1—Watchdog timer

## 8.4.3 Clocks at boot time

The table below show the various clocks and their sources used by the ROM.

**Table 8-4. Normal frequency clocks configuration**

Clock	CCM signal	Source	Frequency (MHz) BT_FREQ=0	Frequency (MHz) BT_FREQ=1
ARM PLL	pll1_sw_clk		396	396
System PLL	pll2_sw_clk		528	528
USB PLL	pll3_sw_clk		480	480
AHB	ahb_clk_root	528 MHz PLL/PFD352	132	88
IPG	ipg_clk_root	528 MHz PLL/PFD352	66	44

## Device initialization

After the reset, each Arm core has access to all peripherals. The ROM code disables the clocks listed in the following table, except for the boot devices listed in the second column.

**Table 8-5. List of disabled clocks**

Clock name	Enabled for boot device
CCGR0_APBHDMA_CLK_SEL	NAND
CCGR0_ASRC_CLK_SEL	
CCGR0_CAN1_CLK_SEL	
CCGR0_CAN1_SERIAL_CLK_SEL	
CCGR0_CAN2_CLK_SEL	
CCGR0_CAN2_SERIAL_CLK_SEL	
CCGR0_UART2_CLK_SEL	UART2
CCGR1_ECSPI1_CLK_SEL	ECSPI1
CCGR1_ECSPI2_CLK_SEL	ECSPI2
CCGR1_ECSPI3_CLK_SEL	ECSPI3
CCGR1_ECSPI4_CLK_SEL	ECSPI4
CCGR1_EPIT1_CLK_SEL	
CCGR1_EPIT2_CLK_SEL	
CCGR1_ADC1_CLK_SEL	
CCGR1_ADC2_CLK_SEL	
CCGR1_UART3_CLK_SEL	
CCGR1_UART4_CLK_SEL	
CCGR2_CSI_CLK_SEL	
CCGR3_CSI_CORE_CLK_SEL	
CCGR2_I2C1_CLK_SEL	
CCGR2_I2C2_CLK_SEL	
CCGR2_I2C3_CLK_SEL	
CCGR2_LCD_CLK_SEL	
CCGR2_PXP_CLK_SEL	
CCGR3_ENET_CLK_SEL	
CCGR3_LCDIF_PIX_CLK_SEL	
CCGR3_QSPI1_CLK_SEL	QSPI1
CCGR3_UART5_CLK_SEL	
CCGR3_UART6_CLK_SEL	
CCGR4_PWM1_CLK_SEL	
CCGR4_PWM2_CLK_SEL	
CCGR4_PWM3_CLK_SEL	
CCGR4_PWM4_CLK_SEL	
CCGR4_RAWNAND_U_BCH_INPUT_A_CLK_SEL	NAND
CCGR4_RAWNAND_U_GPMI_BCH_INPUT_BCG_CLK_SEL	NAND
CCGR4_RAWNAND_U_GPMI_BCH_INPUT_GPMI_CLK_SEL	NAND

*Table continues on the next page...*

**Table 8-5. List of disabled clocks (continued)**

Clock name	Enabled for boot device
CCGR4_RAWNAND_U_GPMI_INPUT_APB_CLK_SEL	NAND
CCGR4_TSC_CLK_SEL	
CCGR5_SDMA_CLK_SEL	
CCGR5_SPDIF_CLK_SEL	
CCGR5_SPBA_CLK_SEL	
CCGR5_UART1_CLK_SEL	
CCGR5_UART7_CLK_SEL	
CCGR5_KPP_CLK_SEL	
CCGR5_SAI1_CLK_SEL	
CCGR5_SAI2_CLK_SEL	
CCGR5_SAI3_CLK_SEL	
CCGR6_USBOH3_CLK_SEL	USB
CCGR6_USDHC1_CLK_SEL	USDHC1
CCGR6_USDHC2_CLK_SEL	USDHC2
CCGR6_EMI_SLOW_CLK_SEL	NOR, OneNAND
CCGR6_PWM8_CLK_SEL	
CCGR6_SIM1_CLK_SEL	
CCGR6_SIM2_CLK_SEL	
CCGR6_I2C4_SERIAL_CLK_SEL	
CCGR6_PWM5_CLK_SEL	
CCGR6_PWM6_CLK_SEL	
CCGR6_PWM7_CLK_SEL	
CCGR6_UART8_CLK_SEL	

#### 8.4.4 Enabling MMU and caches

The boot ROM includes a feature that enables the Memory Management Unit (MMU) and the caches to improve the boot speed.

The L1 instruction cache is enabled at the start of the image download. The L1 data cache, L2 cache, and MMU are enabled during the image authentication. When the HAB authentication completes, the ROM disables the L1 data cache, L2 cache, and MMU.

The L1 Instruction cache, L1 data cache, L2 cache, and MMU is controlled by eFuse. By default, these features are enabled.

Enabling the MMU when booting non-securely with SEC\_CONFIG=Open and setting the CSF pointer in the Image Vector Table to NULL has no impact on the boot performance. With this configuration, it is recommended to blow the BT\_MMU\_DISABLE fuse.

## 8.4.5 Exception handling

The exception vectors located at the start of the ROM are used to map all the Arm exceptions (except the reset exception) to a duplicate exception vector table in the internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in the ROM.

After the boot, the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate exception vector table in the RAM.

### Mapping ROM Exception Vector Table

```
; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR    PC, Reset_Addr
LDR    PC, Undefined_Addr
LDR    PC, SWI_Addr
LDR    PC, Prefetch_Addr
LDR    PC, Abort_Addr
NOP          ; Reserved vector
LDR    PC, IRQ_Addr
LDR    PC, FIQ_Addr

; Define exception vector table
Reset_Addr   DCD    start_address
Undefined_Addr DCD    iRAM_Undefined_Handler
SWI_Addr     DCD    iRAM_SWI_Handler
Prefetch_Addr DCD    iRAM_Prefetch_Handler
Abort_Addr   DCD    iRAM_Abort_Handler
                DCD    0           ; Reserved vector
IRQ_Addr     DCD    iRAM_IRQ_Handler
FIQ_Addr     DCD    iRAM_FIQ_Handler

start_address DCD start ;reset handler vector
```

## 8.4.6 Interrupt handling during boot

No special interrupt-handling routines are required during the boot process. The interrupts are disabled during the boot ROM execution and may be enabled in a later boot stage.

## 8.4.7 Persistent bits

Some modes of the boot ROM require the registers that keep their values after a warm reset. The SRC General-Purpose registers are used for this purpose.

See this table for persistent bits list and description:

**Table 8-6. Persistent bits**

Bit name	Bit location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used—primary and secondary. Used only for the boot modes that support redundant boot.
PERSIST_BLOCK_REWRITE	SRC_GPR10[29]	This bit is used as a warning. It identifies that there are errors in the NAND blocks that hold the application image. See <a href="#">NAND flash</a> for more details.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds the entry function for the CPU0 to wake up from the low-power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds the argument of entry function for the CPU0 to wake up from the low-power mode.
PERSIST_OVERRIDE_SBMR1	SRC_GPR10[28]	This bit instructs the ROM code to use the SRC_GPR9 register as if it is the SBMR1. This allows the software to override the fuse bits and boot from an alternative boot source. This feature is valid for a WDOG time-out reset only, and can be disabled if the DIR_BT_DIS fuse is blown.
PERSIST_SBMR1_VALUE	SRC_GPR9	The value to override the SBMR1.

## 8.5 Boot devices (internal boot)

The chip supports these boot flash devices:

- NOR flash with the External Interface Module (EIM), located on CS0, 16-bit bus width.
- OneNAND flash with the EIM interface, located on CS0, 16-bits bus width.
- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface. Page sizes of 2 KB, 4 KB, and 8 KB. The bus widths of 8-bit with 2 through 40-bit BCH hardware ECC (Error Correction) are supported.
- Quad SPI flash.
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards.
- EEPROM boot via SPI (serial flash).

## Boot devices (internal boot)

The selection of the external boot device type is controlled by the BOOT\_CFG1[7:4] eFUSES. See this table for more details:

**Table 8-7. Boot device selection**

BOOT_CFG1[7:4]	Boot device
0000	NOR/OneNAND (EIM)
0001	QSPI
0011	Serial ROM (SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC
1xxx	Raw NAND

### 8.5.1 NOR flash/OneNAND using EIM interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes, based on the fuse settings.

**Table 8-8. EIM boot eFUSE descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped value	Settings
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0000	0000—boot from the EIM interface
BOOT_CFG1[3]	OEM	NOR/OneNAND selection	Yes	0	0—NOR 1—OneNAND
BOOT_CFG2[7:6]	OEM	Muxing scheme	Yes	00	00—muxed, 16-bit data (low half) interface 01—reserved 10—not muxed, 16-bit data (low half) interface 11—reserved
BOOT_CFG2[5:4]	OEM	OneNAND page size	Yes	00	00—1 KB 01—2 KB 10—4 KB 11—reserved

1. This setting can be overridden by the GPIO settings when the BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.

### 8.5.1.1 NOR flash boot operation

Booting from the NOR flash is supported via the EIM interface. The ROM reads the Image Vector Table and Boot Data structures to determine if the image can be executed directly from the EIM address space or copied to another memory.

The start field of the Boot Data Structure specifies the final location of the image (see [Image Vector Table and Boot Data](#)).

### 8.5.1.2 OneNAND flash boot operation

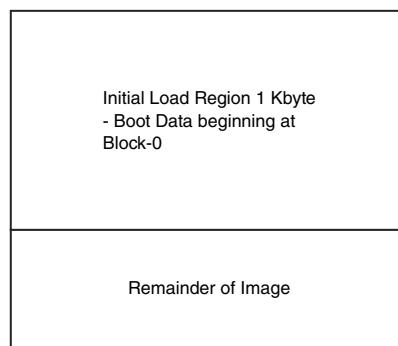

At system power-up, the OneNAND device automatically copies the Initial Load Region of 1 KB from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

#### NOTE

The OneNAND boot RAM memory containing the Initial 1-KB Load Region must contain the IVT, DCD, and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the program image contents to the application destination pointer (located in the start entry of the Boot Data (see [Image Vector Table and Boot Data](#)). The ROM determines the size of the program image by the length specified by the size entry in the Boot Data structure (see [Image Vector Table and Boot Data](#)). A failure in loading data from the OneNAND device for any reason forces the chip to enter the Serial Downloader. Otherwise, the booting from the OneNAND device continues.

This figure illustrates the layout of the program image on the OneNAND boot device:

**Figure 8-4. Program image layout on the OneNAND flash device**

Before accessing the OneNAND device, the chip waits approximately 500 µs after the Power-On Reset. This delay is required for the OneNAND device to become ready. After this initial 500 µs delay, it can take additional 70 µs for the OneNAND device to load the

## Boot devices (internal boot)

Initial Load Region of 1 KB into its boot RAM. The chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 KB was loaded to the OneNAND boot RAM before continuing with the boot flow.

### 8.5.1.3 IOMUX configuration for EIM devices

The EIM interface uses the dedicated contacts on the IC.

The contacts assigned to the data signals used by the EIM are shown in this table:

**Table 8-9. EIM IOMUX pin configuration**

Signal	A/D16 (Muxed, 16-bit data interface)	A+D (Not muxed, 16-bit data interface)
DATA0	CSI_DATA00.alt4	LCD_DATA08.alt4
DATA1	CSI_DATA01.alt4	LCD_DATA09.alt4
DATA2	CSI_DATA02.alt4	LCD_DATA10.alt4
DATA3	CSI_DATA03.alt4	LCD_DATA11.alt4
DATA4	CSI_DATA04.alt4	LCD_DATA12.alt4

## 8.5.2 NAND flash

The boot ROM supports a number of MLC/SLC NAND flash devices from different vendors and LBA NAND flash devices. The Error Correction and Control (ECC) subblock (BCH) is used to detect the errors.

### 8.5.2.1 NAND eFUSE configuration

The boot ROM determines the configuration of the external NAND flash by parameters, either provided by the eFUSE, or sampled on the GPIO pins during boot. See [Table 8-10](#) for parameters details.

#### NOTE

BOOT\_CFGx sampled on the GPIO pins depends on the BT\_FUSE\_SEL setting. See [Boot Fusemap](#) for details.

#### NOTE

For BOOT\_CFG[3:2], although ROM always boots from CS0\_B, for multiple chip selects, such as some NAND chips which consist of multi CS. This fuse must be burned correctly. The number of devices means the number of chip selects.

**Table 8-10. NAND boot eFUSE descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped value	Settings
BOOT_CFG1[7]	OEM	Boot device selection	Yes	0	1—boot from the NAND Interface
BOOT_CFG1[6]	OEM	BT_TOGGLEMODE	Yes	0	0—raw NAND 1—toggle mode NAND
BOOT_CFG1[5:4]	OEM	Pages in block	Yes	0	00—128 01—64 10—32 11—256
BOOT_CFG1[3:2]	OEM	Number of devices	Yes	00	00—1 device 01—2 device 10—4 device 11—Reserved
BOOT_CFG1[1:0]	OEM	Row address cycles	Yes	00	00—3 01—2 10—4 11—5
BOOT_CFG2[7:5]	OEM	Toggle mode 33 MHz preamble delay, read latency	Yes	000	000—16 GPMICLK cycles 001—1 GPMICLK cycles 010—2 GPMICLK cycles 011—3 GPMICLK cycles 100—4 GPMICLK cycles 101—5 GPMICLK cycles 110—6 GPMICLK cycles 111—7 GPMICLK cycles
BOOT_CFG2[4:3]	OEM	Boot search count	Yes	00	00—2 01—2 10—4 11—8
BOOT_CFG2[2]	OEM	Boot frequencies (ARM/DDR)	Yes	0	0—500/400 MHz 1—250/200 MHz
BOOT_CFG2[1]	OEM	Reset time	Yes	0	0—12 ms 1—22 ms (LBA NAND)
0x470[0]	OEM	Override pad settings	Yes	0	Override NAND pad settings 0—use the default values 1—use the PAD_SETTINGS value
0x6D0[5:0]	OEM	PAD_SETTINGS[5:0]	Yes	0	NAND pad settings value

*Table continues on the next page...*

**Table 8-10. NAND boot eFUSE descriptions (continued)**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped value	Settings
0x6D0[11:8]	OEM	READ_RETRY_SEQ_ID[3:0]	Yes	0000	0000—don't use the ROM embedded read-retry sequence 0001—use Micron 20 nm read-retry sequence 0010—use Toshiba A19 nm read-retry sequence 0011—use Toshiba 19 nm read-retry sequence 0100—use SanDisk 19 nm read-retry sequence 0101—use SanDisk 1ynm read-retry sequence 0110—use Hynix 20 nm A die read-retry sequence 0111—use Hynix 26 nm read-retry sequence 1000—use Hynix 20 nm B die read-retry sequence 1001—use Hynix 20 nm C die read-retry sequence 1010 to 1111—reserved

1. The setting can be overridden by the GPIO settings when the BT\_FUSE\_SEL fuse is intact. See [Table 3](#) for the corresponding GPIO pin.

### 8.5.2.2 NAND flash boot flow and Boot Control Blocks (BCB)

There are two BCB data structures:

- FCB
- DBBT

As a part of the NAND media initialization, the ROM driver uses safe NAND timings to search for the Firmware Configuration Block (FCB) that contains the optimum NAND timings, the page address of the Discovered Bad Block Table (DBBT) Search Area, and the start page address of the primary and secondary firmware.

The hardware ECC level to use is embedded inside the FCB block. The FCB data structure is also protected using the ECC. The driver reads raw 2112 bytes of the first sector and runs through the software ECC engine that determines whether the FCB data is valid or not.

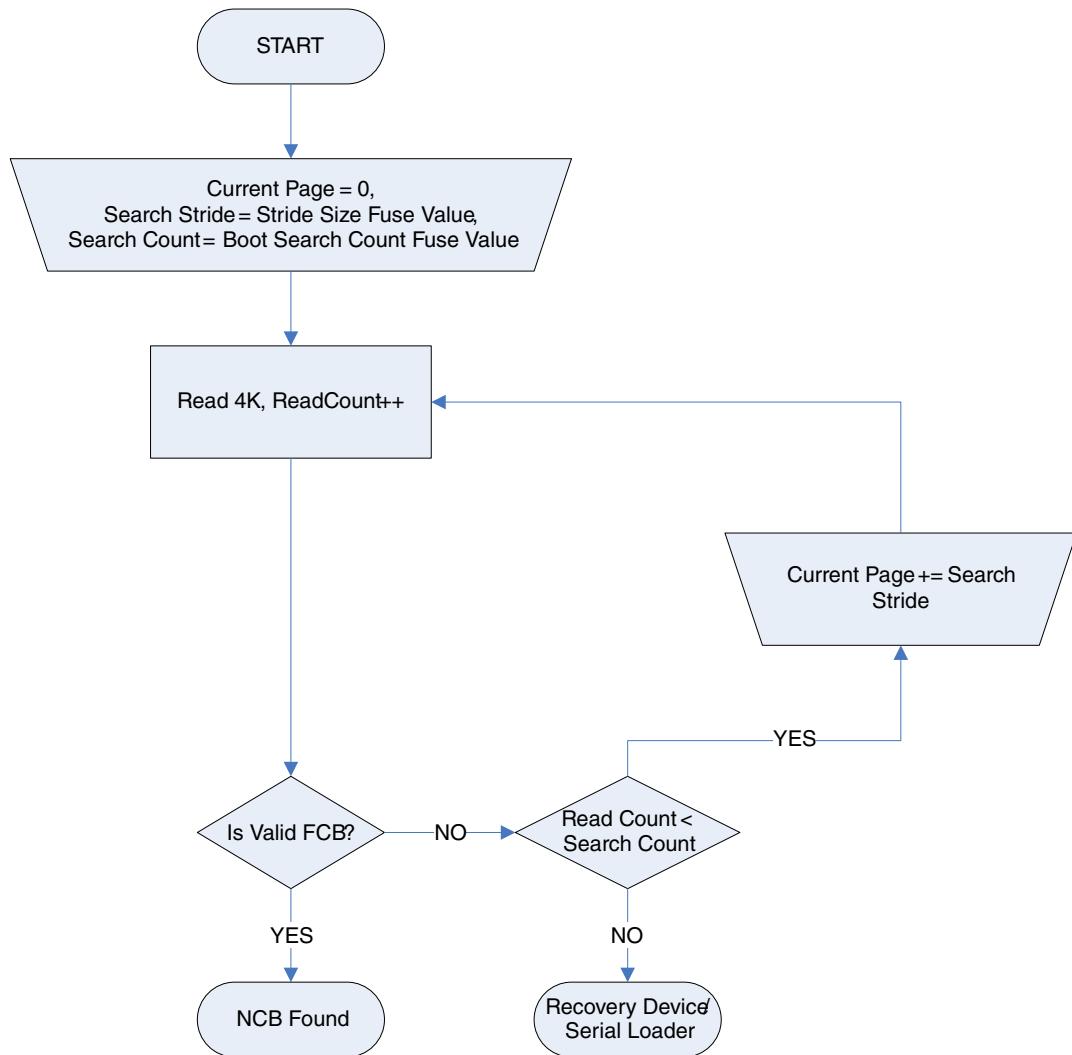

#### **Boot devices (internal boot)**

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments the page number to the Search Stride number of pages to read for the next BCB until the SearchCount pages have been read.

If the search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters the serial download mode.

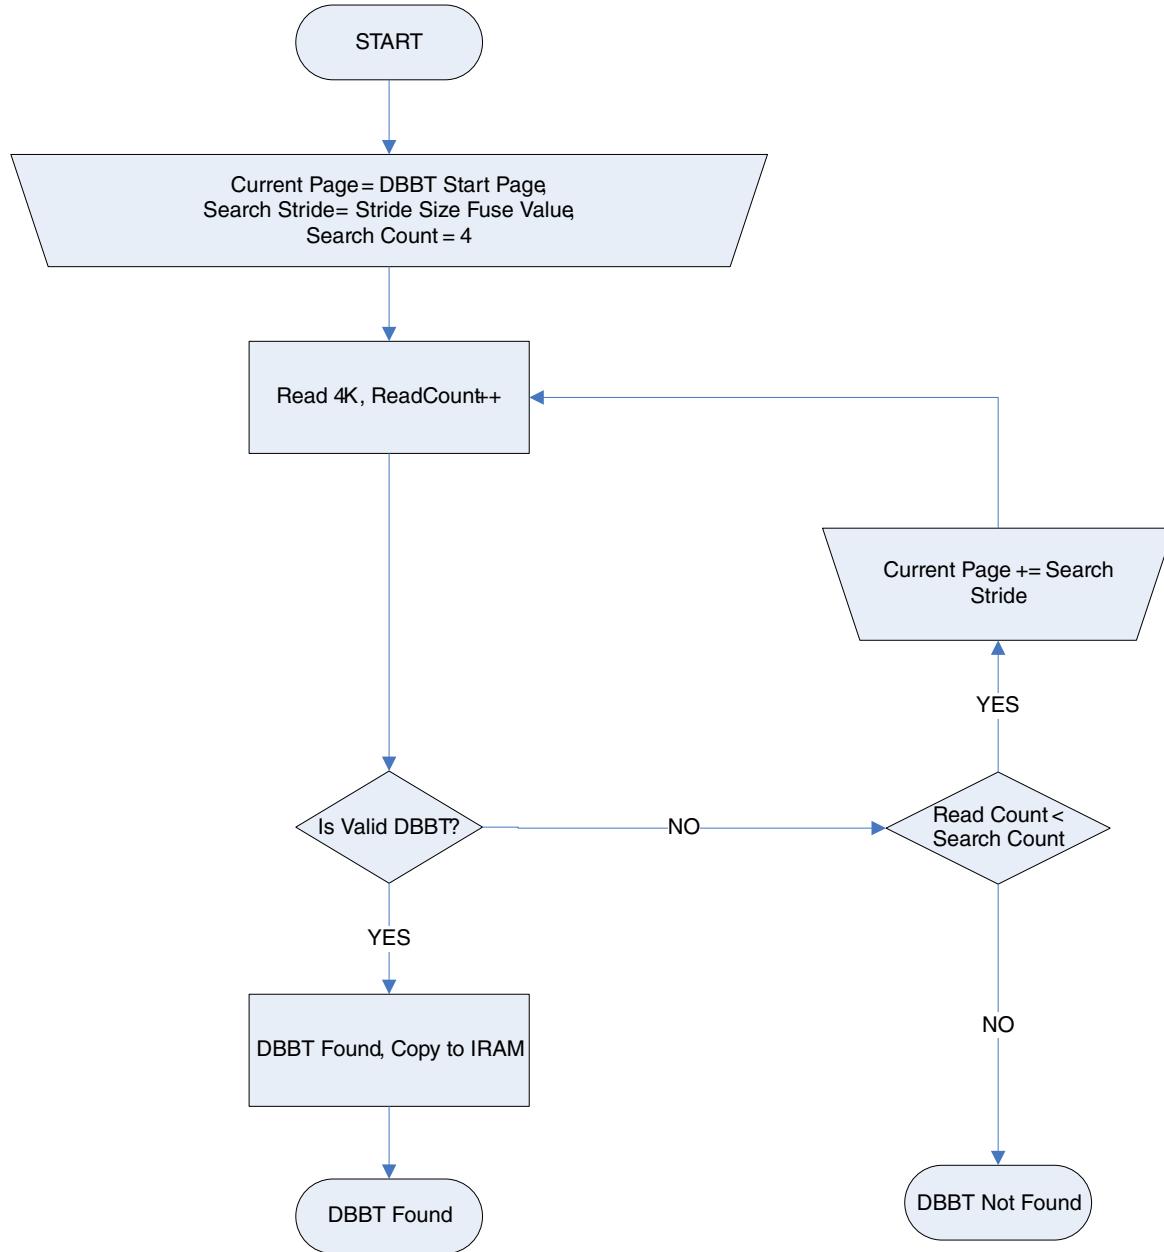

The FCB contains the page address of the DDBT Search Area, and the page address for primary and secondary boot images. The DDBT is searched in the DDBT Search Area, just like the FCB is searched. After the FCB is read, the DDBT is loaded, and the primary or secondary boot image is loaded using the starting page address from the FCB.

This figure shows the state diagram of the FCB search:

**Figure 8-5. FCB search flow**

When the FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If the DDBT Search Area is 0 in the FCB, the ROM assumes that there are no bad blocks on the NAND device boot area. See this figure for the DDBT search flow:

## Boot devices (internal boot)

**Figure 8-6. DBBT search flow**

The BCB search and load function also monitors the ECC correction threshold and sets the PERSIST\_BLOCK\_REWRITE persistent bit if the threshold exceeds the maximum ECC correction ability.

If there is a page with a number of errors higher than ECC can correct during the primary image read, the boot ROM turns on the PERSIST\_SECONDARY\_BOOT bit and performs the software reset (After the software reset, the secondary image is used).

If there is a page with number of errors higher than ECC can correct during secondary image read, the boot ROM goes to the serial loader.

### 8.5.2.3 Firmware configuration block

The FCB is the first sector in the first good block. The FCB must be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so, in case the first NAND block becomes corrupted, the ROM finds its copy in the next NAND block. The search area must span over at least two NAND blocks. The location information for the DDBT search area, FW1, and FW2 are all specified in the FCB. This table shows the flash control block structure:

**Table 8-11. Flash control block structure**

Name	Start byte	Size in bytes	Description
Reserved	0	4	Reserved for Fingerprint #1(Checksum)
FingerPrint	4	4	32-bit word with a value of 0x20424346, in ascii "FCB"
Version	8	4	32-bit version number; this version of FCB is 0x00000001
m_NANDTiming	12	8	8 B of data for eight NAND timing parameters from the NAND datasheet. The eight parameters are:  m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH.  The ROM only uses the first four parameters, but the FCB provides space for other four parameters to be used by the bootloader or other applications.
PageDataSize	20	4	The number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size.
TotalPageSize	24	4	The total number of bytes in a page. Typically, 2112 for 2-KB page or 4224 or 4314 for 4-KB page or 8568 for 8-KB page.

*Table continues on the next page...*

**Table 8-11. Flash control block structure (continued)**

Name	Start byte	Size in bytes	Description
SectorsPerBlock	28	4	The number of pages per block. Typically 64 or 128 or depending on the NAND device type.
NumberOfNANDs	32	4	Not used by ROM
TotalInternalDie	36	4	Not used by ROM
CellType	40	4	Not used by ROM
EccBlockNEccType	44	4	Value from 0 to 20 is used to set the BCH Error Correction level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring the BCH40 page layout registers.
EccBlock0Size	48	4	Size of block B0 used in configuring the BCH40 page-layout registers.
EccBlockNSize	52	4	Size of block BN used in configuring the BCH40 page-layout registers.
EccBlock0EccType	56	4	Value from 0 to 20 used to set the BCH Error Correction level 0, 2, 4, .. or 40 for Block BN of ECC page, used in configuring the BCH40 page layout registers.
MetadataBytes	60	4	Size of metadata bytes used in configuring the BCH40 page-layout registers.
NumEccBlocksPerPage	64	4	Number of the ECC blocks BN not including B0. This value is used in configuring the BCH40 page-layout registers.
EccBlockNEccLevelSDK	68	4	Not used by ROM
EccBlock0SizeSDK	72	4	Not used by ROM
EccBlockNSizeSDK	76	4	Not used by ROM
EccBlock0EccLevelSDK	80	4	Not used by ROM
NumEccBlocksPerPageSDK	84	4	Not used by ROM
MetadataBytesSDK	88	4	Not used by ROM
EraseThreshold	92	4	Not used by ROM
Firmware1_startingPage	104	4	Page number address where the first copy of bootable firmware is located.
Firmware2_startingPage	108	4	Page number address where the second copy of bootable firmware is located.
PagesInFirmware1	112	4	Size of the first copy of firmware in pages.
PagesInFirmware2	116	4	Size of the second copy of firmware in pages.
DBBTSearchAreaStartAddress	120	4	Page address for the bad block table search area.
BadBlockMarkerByte	124	4	This is an input offset in the BCH page for the ROM to swap with the first byte of metadata after reading a page using the BCH40. The ROM supports the restoration of manufacturer-marked bad block markers in the page and this offset is the bad block marker offset location.

*Table continues on the next page...*

**Table 8-11. Flash control block structure (continued)**

Name	Start byte	Size in bytes	Description
BadBlockMarkerStartBit	128	4	This is an input bit offset in the BadBlockMarkerByte for the ROM to use when swapping eight bits with the first byte of metadata.
BBMarkerPhysicalOffset	132	4	This is the offset where the manufacturer leaves the bad block marker on a page.
BCHType	136	4	0 for BCH20 and 1 for BCH40. The chip is backwards compatible to BCH20 and this field tells the ROM to use the BCH20 or BCH40 block.
TMTiming2_ReadLatency	140	4	Toggle mode NAND timing parameter read latency, the ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_PreambleDelay	144	4	Toggle mode NAND timing parameter Preamble Delay. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_CEDelay	148	4	Toggle mode NAND timing parameter CE Delay. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_PostambleDelay	152	4	Toggle mode NAND timing parameter Postamble Delay. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_CmdAddPause	156	4	Toggle mode NAND timing parameter Cmd Add Pause. The ROM uses this value to configure the timing2 register of the GPMI.
TMTiming2_DataPause	160	4	Toggle mode NAND timing parameter Data Pause. The ROM uses this value to configure the timing2 register of the GPMI.
TMSpeed	164	4	This is the toggle mode speed for the ROM to configure the gpmi clock. 0 for 33 MHz, 1 for 40 MHz, and 2 for 66 MHz.
TMTiming1_BusyTimeout	168	4	Toggle mode NAND timing parameter Busy Timeout. The ROM uses this value to configure the timing1 register of the GPMI.
DISBBM	172	4	If 0, the ROM swaps the BadBlockMarkerByte with metadata[0] after reading a page using the BCH40. If the value is 1, the ROM does not swap.
BBMark_spare_offset	176	4	The offset in the metadata place which stores the data in the bad block marker place.
Onfi_sync_enable	180	4	Enable the Onfi nand sync mode support.
Onfi_sync_speed	184	4	Speed for the Onfi nand sync mode: 0 - 24 MHz, 1 - 33 MHz, 2 - 40 MHz, 3 - 50 MHz, 4 - 66 MHz, 5 - 80 MHz, 6 - 100 MHz, 7 - 133 MHz, 8 - 160 MHz, 9 - 200 MHz

*Table continues on the next page...*

**Table 8-11. Flash control block structure (continued)**

Name	Start byte	Size in bytes	Description
Onfi_syncNANDData	188	28	The parameters for the Onfi nand sync mode timing. They are read latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, and busy_timeout.
DISBB_Search	216	4	Disable the bad block search function when reading the firmware, only using DBBT.
Reserved	220	64	Reserved for future use.

### 8.5.2.4 Discovered Bad Block Table (DBBT)

See this table for the DBBT format:

**Table 8-12. DBBT structure**

Name	Start byte	Size in bytes	Description
reserved	0	4	-
FingerPrint	4	4	32-bit word with a value of 0x44424254,in ascii "DBBT"
Version	8	4	32-bit version number; this version of DBBT is 0x00000001
reserved	12	4	-
DBBT_NUM_OF_PAGES	16	4	Size of the DBBT in pages
reserved	20	4*PageSize-20	-
reserved	4*PageSize	4	-
Number of Entries	4*PageSize + 4	4	Number of bad blocks
Bad Block Number	4*PageSize + 8	4	First bad block number
Bad Block Number	4*PageSize + 12	4	Second bad block number
-	-	-	Next bad block number
-	-	-	-
Last bad block number	-	-	Last bad block number

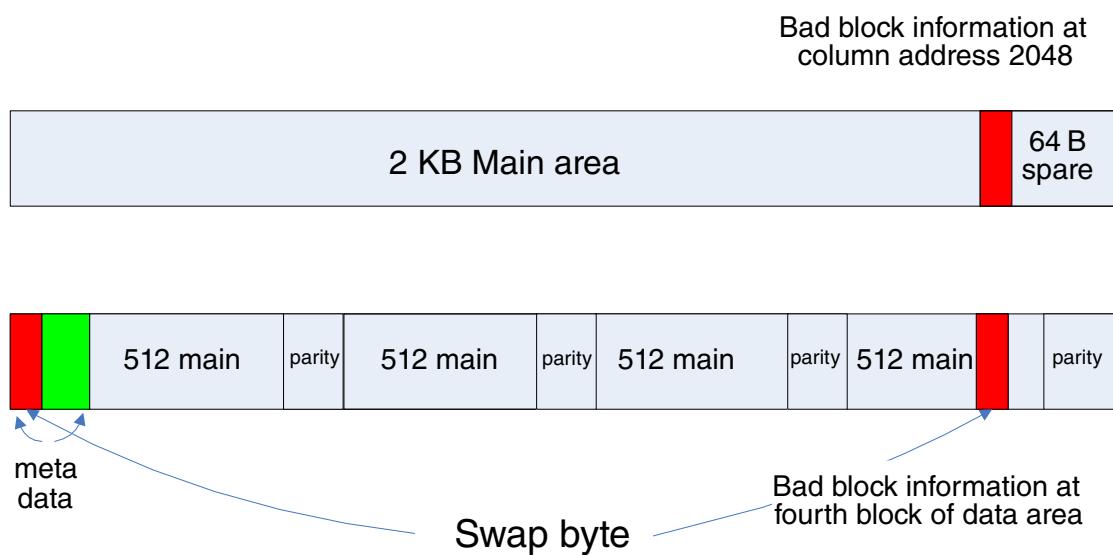

### 8.5.2.5 Bad block handling in ROM

During the firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If the Bad Block table start page is null, check the manufactory made Bad Block marker. The location of the Bad Block marker is at the first three or last three pages in every block of the NAND flash. The NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark that a block is bad or not. A value of 0xFF means good block, non-FF means bad block.

To preserve the BI (bad block information), the flash updater or gang programmer applications must swap the Bad Block Information (BI) data to byte 0 of the metadata area for every page before programming the NAND flash. When the ROM loads the firmware, it copies back the value at metadata[0] to the BI offset in the page data. This figure shows how the factory bad block marker is preserved:

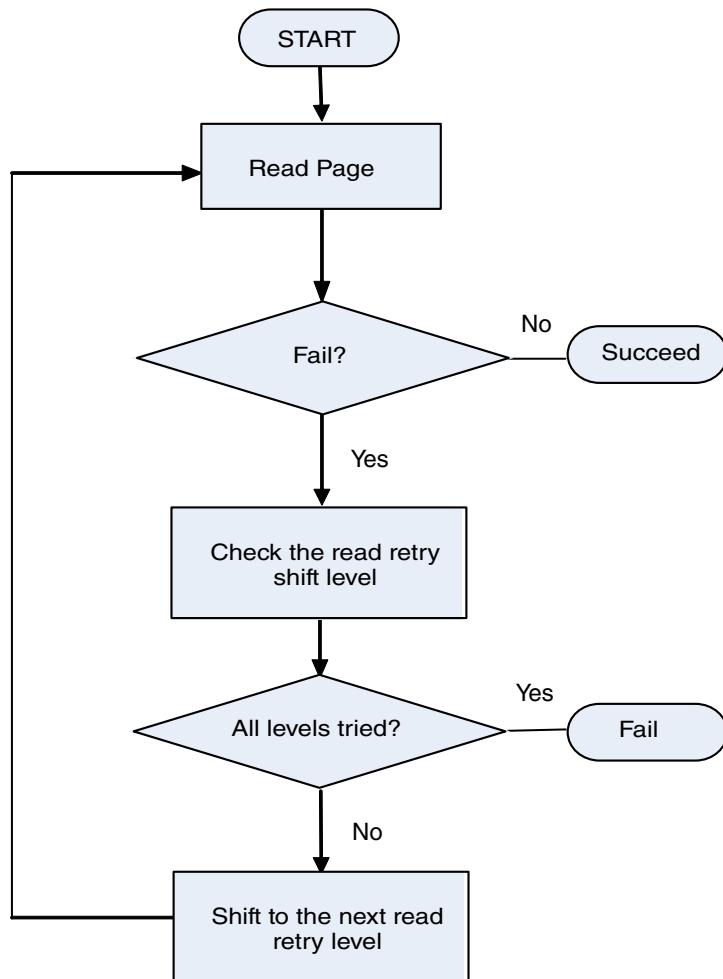

**Figure 8-7. Factory bad block marker preservation**

In the FCB structure, there are two elements (`m_u32BadBlockMarkerByte` and `m_u32BadBlockMarkerStartBit`) to indicate the byte and bit place in the page data that the manufacturer marked the bad block marker.

### 8.5.2.6 Read-retry handling in the ROM

The read-retry is used to recover the bit errors beyond the ECC correction threshold from NAND. If reading of a page failed and the `read_retry_enable` field in FCB is set to 1, the ROM issues a read-retry command sequence to shift the read level before reading the page again. If the previous reading failed, the ROM continues to shift the read level until the reading succeeds or all levels were tried. The state diagram of the read-retry is shown in this figure:

**Figure 8-8. Read-retry flow**

Different vendors and different processes may have different read-retry sequences. At this time, the ROM supports five read-retry sequences. Blowing the READ\_RETRY\_SEQ\_ID[3:0] fuse can help to determine which sequence to use.

The read-retry sequences are listed in this table:

**Table 8-13. Read-retry sequences**

Vendor	Process	READ_RETRY_SEQ_ID[3:0]	Comment
Micron	20nm	2'b0001	The detail of this RR sequence is documented in "64 Gb, 128 Gb, 256 Gb, 512 Gb Asynchronous/Synchronous NAND Features(Release: 4/20/12)", contact Micron for that document.

*Table continues on the next page...*

**Table 8-13. Read-retry sequences (continued)**

Vendor	Process	READ_RETRY_SEQ_ID[3:0]	Comment
Toshiba	A19nm	2'b0010	The detail of this RR sequence is documented in "TOSHIBA Technical Information A19nm MLC NAND Retry Read Sequence", contact Toshiba for that document.
	19nm	2'b0011	The detail of this RR sequence is documented in "TOSHIBA Technical Information 19nm MLC NAND Read Retry Sequence Rev1.6", contact Toshiba for that document.
SanDisk	19nm	2'b0100	The detail of this RR sequence is documented in "App Note 023 (v1.0) 19nm eX2 ABL Dynamic Read Sequence & Parameter Table", contact SanDisk for that document.
	1ynm	2'b0101	The detail of this RR sequence is documented in "Application Note 1y_023 19nm eX2 ABL Dynamic Read Sequence & Parameter Table", contact SanDisk for that document.
Hynix	26nm	2'b0111	The detail of this RR sequence is documented in "26nm 32Gb MLC RAWNAND", contact Hynix for that document.
	20nm A Die	2'b0110	The detail of this RR sequence is documented in "20nm 32Gb MLC C-die Application Note", contact Hynix for that document.
	20nm B Die	2'b1000	The detail of this RR sequence is documented in "20nm 32Gb MLC C-die Application Note", contact Hynix for that document.
	20nm C Die	2'b1001	The detail of this RR sequence is documented in "20nm 32Gb MLC C-die Application Note", contact Hynix for that document.

### 8.5.2.7 Toggle mode DDR NAND boot

If the BT\_TOGGLEMODE efuse is blown, the ROM does the following to boot from the Samsung's toggle mode DDR NAND.

#### 8.5.2.7.1 GPMI and BCH clocks configuration

The ROM sets the clock source and the dividers in the CCM registers.

If the BOOT\_CFG1[6] is set (toggle mode), the GPMI/BCH CLK source is PLL2PFD4, and running at 66 MHz, otherwise the GPMI/ BCH CLK souce is PLL3, running at 24 MHz. The ROM sets the default values to timing0, timing1, and timing2 gpmi registers for 24 MHz clock speed. It uses the BOOT\_CFG fuse to configure the GPMI timing2 register parameters preamble delay and read latency. The default value for these parameters is 2 when the fuses are not blown.

The default timing parameter values used by the ROM for the toggle-mode device are:

- Timing0.ADDRESS\_SETUP = 5
- Timing0.DATA\_SETUP = 10
- Timing0.DATA\_HOLD = 10
- Timing1.DEVICE\_BUSY\_TIMEOUT = 0 x 500
- Timing2.READ\_LATENCY = BOOT\_CFG2[7:5] if blown, otherwise 2
- Timing2.CE\_DELAY = 2
- Timing2.PREAMBLE\_DELAY = BOOT\_CFG2[7:5] if blown, otherwise 2
- Timing2.POSTAMBLE\_DELAY = 3
- Timing2.CMDADD\_PAUSE = 4
- Timing2.DATA\_PAUSE = 6

The default timing parameters can be overridden by the TMTiming2\_ReadLatency, TMTiming2\_PreambleDelay, TMTiming2\_CEDelay, TMTiming2\_PostambleDelay, TMTiming2\_CmdAddPause, and TMTiming2\_DataPause parameters of the FCB.

### **8.5.2.7.2 Setup DMA for DDR transfers**

In the DMA descriptors, the GPMI is configured to read the page data at a double data rate, the word length is set to 16, and the transfer count to a half of the page size.

### **8.5.2.7.3 Reconfigure timing and speed using values in FCB**

After reading the FCB page with the GPMI set to default timings and a speed of 33 MHz, the ROM reconfigures the CCM dividers to run the gpmi/bch clks to a desired speed specified in the FCB for the rest of the boot process. The GPMI timing registers are also reconfigured to the values specified in the FCB.

The GPMI speed can be configured using the FCB parameter TMSPeek:

- 0—24 MHz
- 1—33 MHz
- 2—40 MHz
- 3—50 MHz
- 4—66 MHz
- 5—80 MHz
- 6—100 MHz
- 7—133 MHz
- 8—160 MHz
- 9—200 MHz

The GPMI timing0 register fields data\_setup, data\_hold, and address\_setup are set to the values specified for the data\_setup and data\_hold and address\_setup in the FCB member m\_NANDTiming.

The GPMI timing1.DEVICE\_BUSY\_TIMEOUT is set to the value specified in the FCB member TMTiming1\_BusyTimeout.

The GPMI timing2 register values are set using the FCB members TMTiming2.READ\_LATENCY, CE\_DELAY, PREAMBLE\_DELAY, POSTAMBLE\_DELAY, CMDADD\_PAUSE, and DATA\_PAUSE.

## 8.5.2.8 Typical NAND page organization

### 8.5.2.8.1 BCH ECC page organization

The first data block is called block 0 and the rest of the blocks are called block N. A separate ECC level scan is used for block 0 and block N.

The metadata bytes must be located at the beginning of a page, starting at byte 0, followed by the data block 0, the ECC bytes for data block 0, the block 1 and its ECC bytes, and so on, up until the N data blocks. The ECC level for the block 0 can be different from the ECC level for the rest of the blocks.

For the NAND boot with page-size restrictions and the data block size restricted to 512 B, only few combinations of the ECC for block 0 and block N are possible.

This figure shows the valid layout for 2112-byte sized page.

M	Block0 512 bytes	EccB0	Block1 512 bytes	EccBN	Block2 512 bytes	EccBN	Block3 512 bytes	EccBN
---	---------------------	-------	---------------------	-------	---------------------	-------	---------------------	-------

**Figure 8-9. Valid layout for 2112-byte sized page**

The example below is for 13 bits of parity (GF13). The number of ECC bits required for a data block is calculated using the (ECC\_Correction\_Level \* 13) bits.

In the above layout, the ECC size for EccB0 and EccBN must be selected to not exceed a total page size of 2112 bytes. The EccB0 and EccBN can be one of the 2, 4, 6, 8, 10, 12, 14, 16, 18, and 20 bits on the ECC correction level. The total bytes are:

$$[M + (\text{data\_block\_size} \times 4) + ([\text{EccB0} + (\text{EccBN} \times 3)] \times 13) / 8] \leq 2112;$$

M = metadata bytes and data\_block\_size is 512.

#### Boot devices (internal boot)

There are four data blocks of 512 bytes each in a page of 2-KB page sized NAND. The values of EccB0 and EccBN must be such that the above calculation does not result in a value greater than 2112 bytes.

M	Block0 512 bytes	EccB0	Block1 512 bytes	EccBN	Block2 512 bytes	EccBN	Block3 512 bytes	EccBN
	Block4 512 bytes	EccBN	Block5 512 bytes	EccBN	Block6 512 bytes	EccBN	Block7 512 bytes	EccBN

**Figure 8-10. Valid layout for 4-KB sized page**

Different NAND manufacturers have different sizes for a 4-KB page; 4314 bytes is typical.

$$[M + (\text{data\_block\_size} \times 8) + ([\text{EccB0} + (\text{EccBN} \times 7)] \times 13) / 8] \leq 4314;$$

M= metadata bytes and data\_block\_size is 512.

There are eight data blocks of 512 bytes each in a page of a 4-KB page sized NAND. The values of the EccB0 and EccBN must be such that the above calculation does not result in a value greater than the size of a page in a 4-KB page NAND.

#### 8.5.2.8.2 Metadata

The number of bytes used for the metadata is specified in the FCB. The metadata for the BCH encoded pages is placed at the beginning of a page. The ROM only cares about the first byte of metadata to swap it with a bad block marker byte in the page data after each page read; it is important to have at least one byte for the metadata bytes field in the FCB data structure.

#### 8.5.2.9 IOMUX configuration for NAND

The following table shows the RawNAND IOMUX pin configuration.

**Table 8-14. NAND IOMUX pin configuration**

Signal	Pad name
NAND.CLE	NAND_CLE.alt0
NAND.ALE	NAND_ALE.alt0
NAND.DATA00	NAND_DATA00.alt0

*Table continues on the next page...*

**Table 8-14. NAND IOMUX pin configuration (continued)**

Signal	Pad name
NAND.DATA01	NAND_DATA01.alt0
NAND.DATA02	NAND_DATA02.alt0
NAND.DATA03	NAND_DATA03.alt0
NAND.DATA04	NAND_DATA04.alt0
NAND.DATA05	NAND_DATA05.alt0
NAND.DATA06	NAND_DATA06.alt0
NAND.DATA07	NAND_DATA07.alt0
NAND.RE_B	NAND_RE_B.alt0
NAND.WE_B	NAND_WE_B.alt0
NAND.CE1_B	NAND_CE1_B.alt0
NAND.CE0_B	NAND_CE0_B.alt0
NAND.DQS	NAND_DQS.alt0
NAND.READY_B	NAND_READY_B.alt0
NAND.CE2_B	CSI_MCLK.alt2
NAND.CE3_B	CSI_PIXCLK.alt2
NAND.WP_B	NAND_WP_B.alt0

## 8.5.3 Expansion device

The ROM supports booting from the MMC/eMMC and SD/eSD compliant devices.

### 8.5.3.1 Expansion device eFUSE configuration

The SD/MMC/eSD/eMMC/SDXC boot can be performed using either the USDHC ports, based on the setting of the BOOT\_CFG2[4:3] (Port Select) fuse or it is associated to the GPIO input value at the boot.

All USDHC ports support the eMMC4.4 and eMMC4.5 fast boot. See this table for details:

**Table 8-15. USDHC boot eFUSE descriptions**

Fuse	Config	Definition	GPIO	Shipped value	Settings
0x450[7:6]	OEM	Boot device selection	Yes	00	01 - Boot from the USDHC interface
0x450[5]	OEM	SD/MMC selection	Yes	0	0 - SD/eSD/SDXC 1 - MMC/eMMC
0x450[4]	OEM	Fast boot support	Yes	0	0 - Normal boot

*Table continues on the next page...*

**Table 8-15. USDHC boot eFUSE descriptions

0X6D0[5:0]	OEM	PAD_SETTINGS	Yes	000000	Override number

The boot code supports these standards:

#### Boot devices (internal boot)

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST\_BOOT
- SDXCv3.0

The MMC/SD/eSD/SDXC/eMMC can be connected to any of the uSDHC blocks and can be booted by copying 4 KB of data from the MMC/SD/eSD/eMMC device to the internal RAM. After checking the Image Vector Table header value (0xD1) from program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts from the Boot Data Structure the destination pointer and length of image to be copied to the RAM device from where the code execution occurs.

The maximum image size to load into the SD/MMC boot is 32 MB. This is due to a limited number of uSDHC ADMA Buffer Descriptors allocated by the ROM.

#### NOTE

The initial 4 KB of the program image must contain the IVT, DCD, and the Boot Data structures.

**Table 8-16. SD/MMC frequencies**

	SD	MMC	MMC (DDR mode)
Identification (KHz)	347.22		
Normal-speed mode (MHz)	25	20	25
High-speed mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

#### NOTE

The boot ROM code reads the application image length and the application destination pointer from the image.

### 8.5.3.2 MMC and eMMC boot

This table provides the MMC and eMMC boot details.

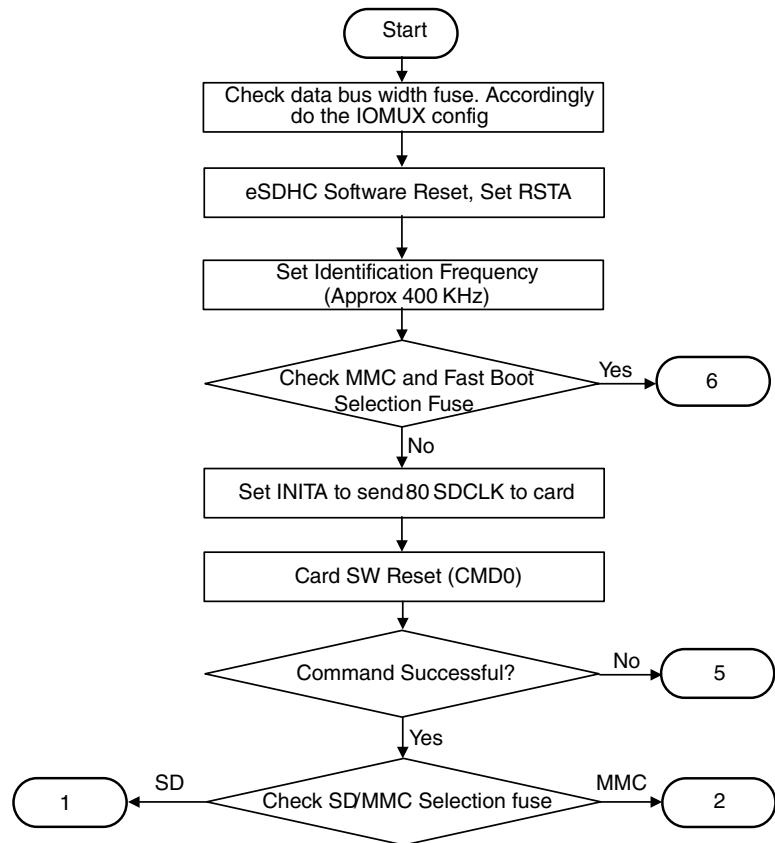

**Table 8-17. MMC and eMMC boot details**

Normal boot mode	During the initialization (normal boot mode), the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, the voltage validation is performed, and the ROM boot code checks the high-voltage settings and the card capacity. The ROM boot
------------------	--

*Table continues on the next page...*

**Table 8-17. MMC and eMMC boot details (continued)**

	<p>code supports both the high-capacity and low-capacity MMC/eMMC cards. After the initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in the normal boot mode or 40 MHz in the high-speed mode). The eMMC is also interfaced via the USDHC and follows the same flow as the MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in the BOOT_PARTITION_ENABLE field or the user partition was mentioned, the ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 device supporting special boot mode	If using an eMMC4.3 or eMMC4.4 device that supports the special boot mode, it can be initiated by pulling the CMD line low. If the BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via the DATA lines and the ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. If the BOOT ACK is enabled, the ROM waits 50 ms to get the BOOT ACK and if the BOOT ACK is received by the ROM. If BOOT ACK is disabled ROM waits 1 second for data. If the BOOT ACK or data was received, the eMMC4.3/eMMC4.4 is booted in the "boot mode", otherwise the eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by the BOOT_CFG1[4] (fast boot) fuse. The BOOT ACK is selected by the BOOT_CFG2[1].
eMMC4.4 device	If using the eMMC4.4 device, the Double Data Rate (DDR) mode can be used. This mode can be selected by the BOOT_CFG2[7:5] (bus width) fuse.

**Figure 8-11. Expansion device boot flow (1 of 6)**

i.MX 6ULL Applications Processor Reference Manual, Rev. 1, 11/2017

### 8.5.3.3 SD, eSD, and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, the SD/eSD/SDXC card voltage validation is performed. During the voltage validation, the boot code first checks with the high-voltage settings; if that fails, it checks with the low-voltage settings.

The capacity of the card is also checked. The boot code supports the high-capacity and low-capacity SD/eSD/SDXC cards after the voltage validation card initialization is done.

During the card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes that the card is a normal SD or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, the boot code switches to a higher frequency (25 MHz in the normal-speed mode or 50 MHz in the high-speed mode). The ROM also supports the FAST\_BOOT mode booting from the eSD card. This mode can be selected by the BOOT\_CFG1[4] (Fast Boot) fuse described in [Table 8-15](#).

For the UHSI cards, the clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2, ports. This enables the voltage switch process to set the signaling voltage to 1.8 V during the voltage validation. The bus width is fixed at a 4-bit width and a sampling point tuning process is needed to calibrate the number of the delay cells. If the SD Loopback Clock eFuse is set, the feedback clock comes directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by the BOOT\_CFG1[3:2], and the SD Loopback Clock is selected by the BOOT\_CFG1[0].

The UHSI calibration start value (MMC\_DLL\_DLY[6:0]) and the step value (BOOT\_CFG2[7:5]) can be set to optimize the sample point tuning process.

If the SD Power Cycle Enable eFuse is 1, the ROM sets the SD\_RST pad low, waits for 5 ms, and then sets the SD\_RST pad high. If the SD\_RST pad is connected to the SD power supply enable logic on board, it enables the power cycle of the SD card. This may be crucial in case the SD logic is in the 1.8 V states and must be reset to the 3.3 V states.

The SDR50 and SDR104 boots are not supported on the USDHC1 and USDHC2 ports because there are no reset signals for those ports when connected in the IOMUX.

### 8.5.3.4 IOMUX configuration for SD/MMC

**Table 8-18. SD/MMC IOMUX pin configuration**

Signal	USDHC1	USDHC2

### 8.5.3.5 Redundant boot support for expansion device

The ROM supports the redundant boot for an expansion device. The primary or secondary image is selected, depending on the PERSIST\_SECONDARY\_BOOT setting. (see [Table 8-6](#)).

If the PERSIST\_SECONDARY\_BOOT is 0, the boot ROM uses address 0x0 for the primary image.

If the PERSIST\_SECONDARY\_BOOT is 1, the boot ROM reads the secondary image table from address 0x200 on the boot media and uses the address specified in the table.

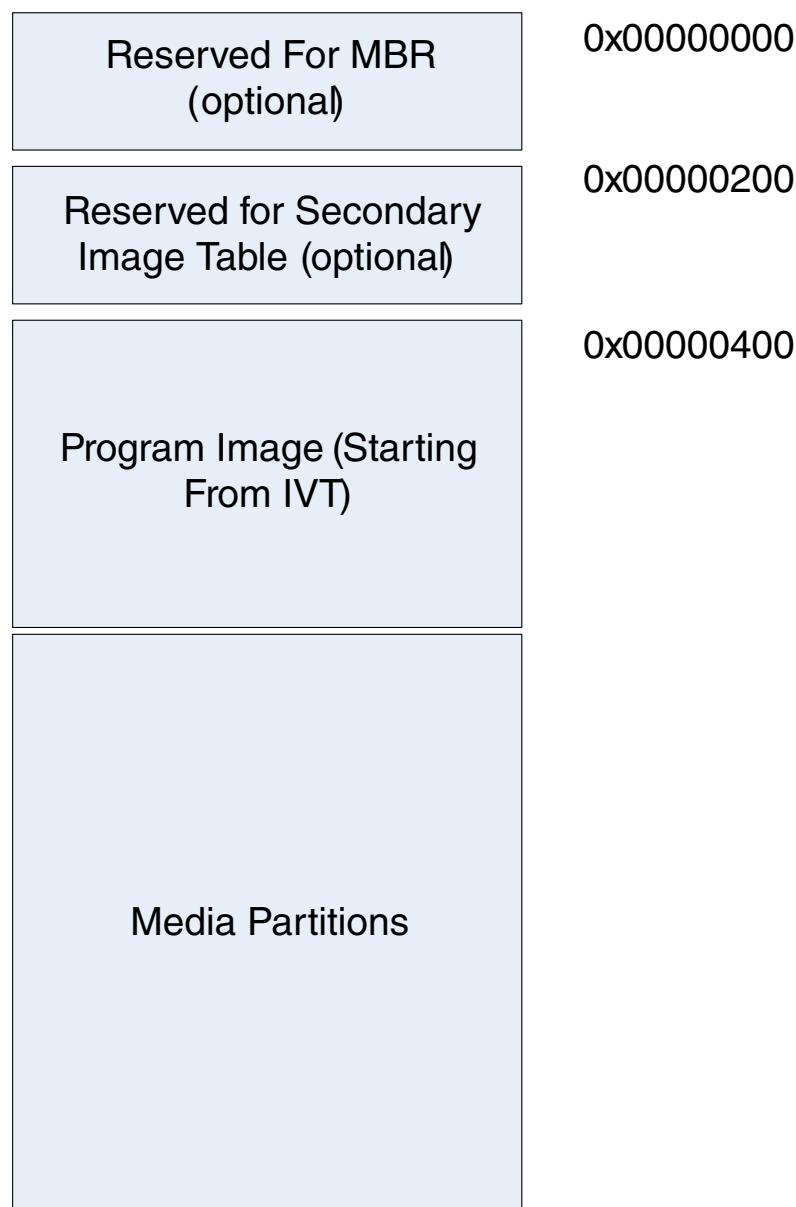

**Table 8-19. Secondary image table format**

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- The tag is used as an indication of the valid secondary image table. It must be 0x00112233.
- The firstSectorNumber is the first 512-byte sector number of the secondary image.

For the secondary image support, the primary image must reserve the space for the secondary image table. See this figure for the typical structures layout on an expansion device.

**Figure 8-18. Expansion device structures layout**

For the Closed mode, if there are failures during primary image authentication, the boot ROM turns on the PERSIST\_SECONDARY\_BOOT bit (see [Table 8-6](#)) and performs the software reset. (After the software reset, the secondary image is used.)

## 8.5.4 Serial ROM through SPI

The chip supports booting from serial memory devices, such as EEPROM and serial flash, using the SPI.

These ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4) interfaces.

### 8.5.4.1 Serial ROM eFUSE configuration

The boot ROM code determines the type of device using the following parameters, either provided by the eFUSE settings or sampled on the I/O pins, during boot.

See this table for details:

**Table 8-20. Serial ROM boot eFUSE descriptions**

Fuse	Config	Definition	GPIO <sup>1</sup>	Shipped value	Settings
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0000	0011 - Boot from the serial ROM
BOOT_CFG4[6]	OEM	EEPROM recovery enable	Yes	0	0 - Disabled EEPROM recovery 1 - Enabled EEPROM recovery
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPIx_SS0 01 - ECSPIx_SS1 10 - ECSPIx_SS2 11 - ECSPIx_SS3
BOOT_CFG4[3]	OEM	SPI addressing (SPI only)	Yes	0	0 - 2 B (16-bit) 1 - 3 B (24-bit)
BOOT_CFG4[2:0]	OEM	Port select	Yes	00	000 - ECSPI-1 001 - ECSPI-2 010 - ECSPI-3 011 - ECSPI-4 1xx - Reserved

1. The setting can be overridden by the GPIO settings when the BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4 block can be used as a boot device using the ECSPI interface for the serial ROM boot. The SPI interface is configured to operate at 15 MHz for 3-byte addressing devices and at 3.75 MHz for 2-byte addressing devices.

The boot ROM copies 4 KB of data from the serial ROM device to the internal RAM. After checking the Image Vector Table header value (0xD1) from the program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts the destination pointer and length of image from the Boot Data Structure to be copied to the RAM device from where the code execution occurs.

#### **NOTE**

The Initial 4 KB of program image must contain the IVT, DCD, and the Boot Data Structures.

#### **8.5.4.2 ECSPI boot**

The Enhanced Configurable SPI (ECSPI) interface is configured in the master mode and the EEPROM device is connected to the ECSPI interface as a slave.

The boot ROM code copies 4 KB of data from the EEPROM device to the internal RAM. If the DCD verification is successful, the ROM code copies the initial 4 KB of data, as well as the rest of the image extracted from the application image, directly to the application destination. The ECSPI can read data from the EEPROM using 2- or 3-byte addressing. Its burst length is 32 B.

#### **NOTE**

The Serial ROM Chip Select Number is determined by the BOOT\_CFG4[5:4] (Chip Select) fuse.

When using the SPI as a boot device, the chip supports booting from both the serial EEPROM and serial flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at the boot (see [Table 8-20](#) for details).

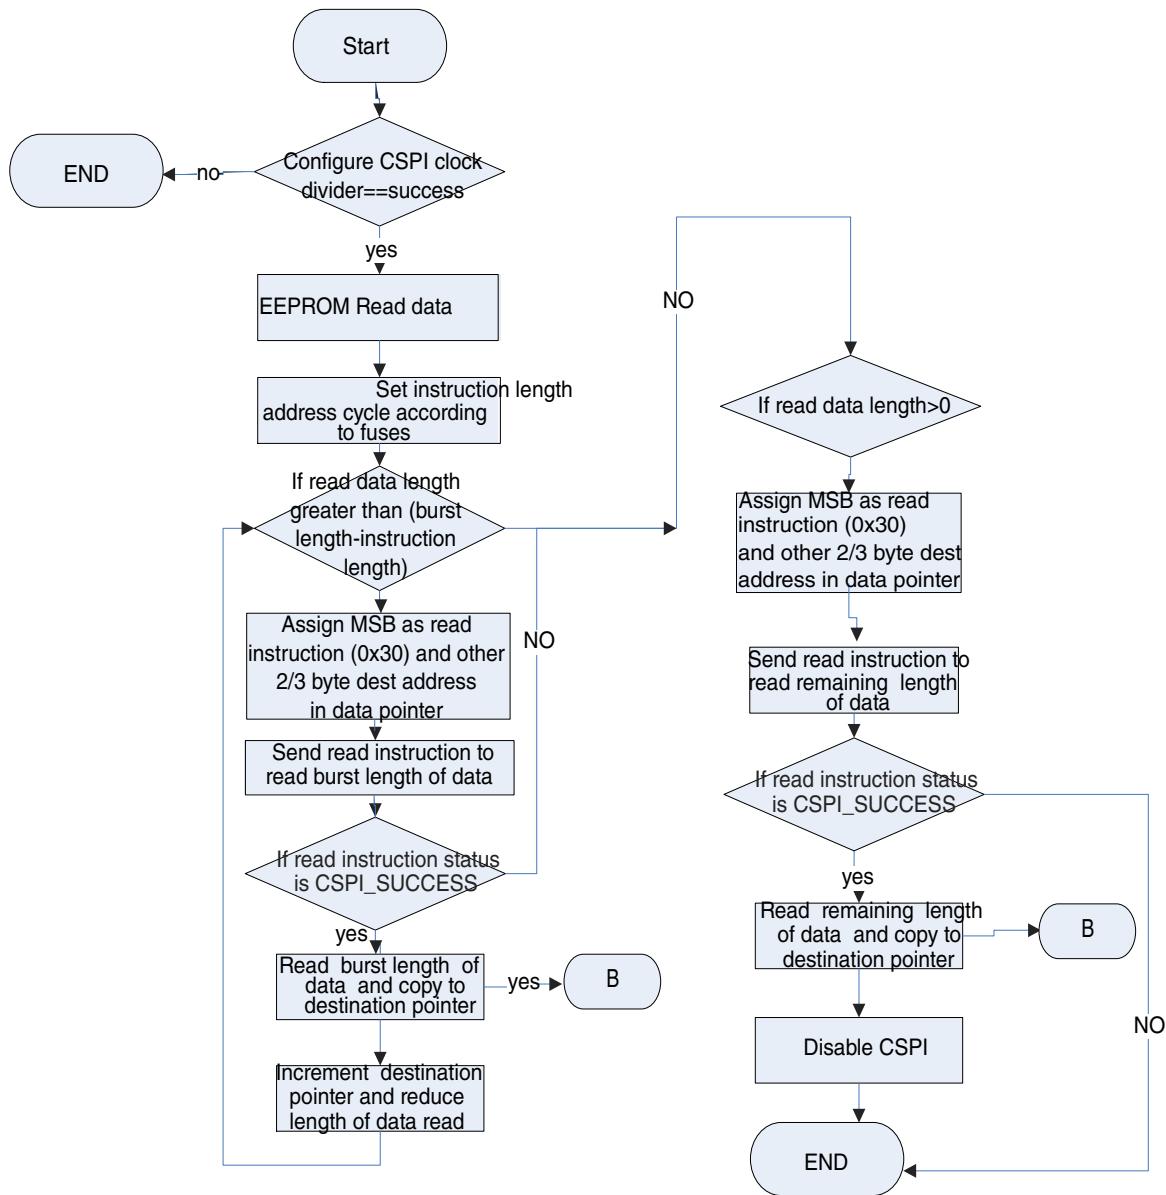

Figure 8-19. CSPI flow chart

#### 8.5.4.2.1 ECSPI IOMUX pin configuration

The contacts assigned to the signals used by the CSPI blocks are shown in this table:

Table 8-21. ECSPI IOMUX pin configuration

Signal	eCSPI1	eCSPI2	eCSPI3	eCSPI4
MISO	CSI_DATA07.alt3	CSI_DATA03.alt3	UART2_RTS_B.alt8	ENET2_TX_CLK.alt3
MOSI	CSI_DATA06.alt3	CSI_DATA02.alt3	UART2_CTS_B.alt8	ENET2_TX_EN.alt3

Table continues on the next page...

**Table 8-21. ECSPI IOMUX pin configuration  
(continued)**

Signal	eCSPI1	eCSPI2	eCSPI3	eCSPI4
<b>SCLK</b>	CSI_DATA04.alt3	CSI_DATA00.alt3	UART2_RX_DATA.alt8	ENET2_TX_DATA1.alt3

## 8.6 QuadSPI serial flash memory boot

### 8.6.1 QuadSPI eFUSE configuration

**Table 8-22. QSPI Boot eFUSE descriptions**

Fuse	Config	Definition	GPIO	Shipped value	Settings
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0001	0001 - Boot from QuadSPI
BOOT_CFG1[3]	OEM	QuadSPI interface selection	Yes	0	0 - QSPI1 1 - Reserved

### 8.6.2 QuadSPI serial flash BOOT operation

The Boot ROM attempts to boot from the QuadSPI flash if the BOOT\_CFG1[7:4] fuses are programmed to 0001, as shown in the QuadSPI eFUSE configuration table. The ROM initializes the requested QuadSPI Interface as selected in the Fuse bit BOOT\_CFG1[3] in the QuadSPI eFUSE configuration. The QuadSPI interface initialization is a two-step process.

The ROM expects the QuadSPI configuration parameters (as explained in the QuadSPI Configuration Parameters) to be present in the serial flash memory from the offset 0x400 of serial flash of length 512 bytes. The ROM reads these configuration parameters using the default read command configured in the LUT of the QuadSPI interface with the SCLOCK operating at 18 MHz.

## QuadSPI serial flash memory boot

In the second step, the ROM configures the selected QuadSPI interface with the configuration parameters read from the serial flash and starts the boot procedure. Refer to Table 19-12 for details on the QuadSPI configuration parameters and to the QuadSPI boot flow chart for a detailed boot flow chart of the QuadSPI.

Both booting the XIP and non-XIP image is supported from the serial flash. For the XIP boot, the image must be built for the QuadSPI address space, and for the non-XIP, the image can be built to execute from the DDR or OCRAM.

For the QUAD mode boot, the Boot ROM expects the Quad Enable bit inside the QSPI flash to be already set before the booting starts. Therefore, the QUAD enable bit must be set in the non-volatile register of the flash at the time of programming.

### NOTE

If the SPI flash device requires the quad enable command, it can be sent via these configuration structure fields:

device\_quad\_mode\_en, device\_cmd, write\_cmd\_ipcr,  
write\_enable\_ipcr, busy\_bit\_offset, and read\_status\_ipcr.

### 8.6.3 QuadSPI configuration parameters

The QuadSPI Configuration Parameters Table is built in the boot image at a fixed offset of 0x400 from the QSPI NOR A1 base address (368 B). This table lists the various QuadSPI configuration parameters:

**Table 8-23. QuadSPI configuration parameters**

Name	Offset	Size in bytes	Description															
DQS Loopback	0	4	DQS LoopBack Mode to enable the Dummy Pad, 0 - Disable, 1 - Enable															
Hold Delay	4	4	Hold Delay for QSPI[0,1] A/B  <table border="1"><thead><tr><th>Value</th><th>QSPI1 B</th><th>QSPI1 A</th></tr></thead><tbody><tr><td>00</td><td>Disable</td><td>Disable</td></tr><tr><td>01</td><td>Disable</td><td>Enable</td></tr><tr><td>10</td><td>Enable</td><td>Disable</td></tr><tr><td>11</td><td>Enable</td><td>Enable</td></tr></tbody></table>	Value	QSPI1 B	QSPI1 A	00	Disable	Disable	01	Disable	Enable	10	Enable	Disable	11	Enable	Enable
Value	QSPI1 B	QSPI1 A																
00	Disable	Disable																
01	Disable	Enable																
10	Enable	Disable																
11	Enable	Enable																
Reserved	8	4	Reserved to 0															
Reserved	12	4	Reserved to 0															
device_quad_mo de_en	16	4	Send the Quad enable command to the SPI device.															
device_cmd	20	4	Command to send to the SPI device.															

*Table continues on the next page...*

**Table 8-23. QuadSPI configuration parameters (continued)**

Name	Offset	Size in bytes	Description																
write_cmd_ipcr	24	4	IPCR register value for a write command																
write_enable_ipcr	28	4	IPCR register value for Enable																
Chip Select hold time	32	4	This is a chip-select hold time in terms of Serial clock (For Example 1 serial clock cycle 0-15).																
Chip Select setup time	36	4	Chip select setup time in terms of Serial clock (For example 1 serial clock).																
Serial Flash A1 size	40	4	Serial flash A1 size in units of bytes																
Serial Flash A2 size	44	4	Serial flash A2 size in units of bytes																
Serial Flash B1 size	48	4	Serial flash B1 size in units of bytes																
Serial Flash B2	52	4	Serial flash B2 size in units of bytes																
Serial Clock Frequency	56	4	<p>This is a serial clock frequency select parameter.</p> <table border="1"> <thead> <tr> <th>Value</th><th>Clock</th></tr> </thead> <tbody> <tr> <td>00</td><td>18 MHz</td></tr> <tr> <td>01</td><td>49 MHz</td></tr> <tr> <td>02</td><td>55 MHz</td></tr> <tr> <td>03</td><td>60 MHz</td></tr> <tr> <td>04</td><td>66 MHz</td></tr> <tr> <td>05</td><td>76 MHz</td></tr> <tr> <td>06</td><td>99 MHz (only SDR mode)</td></tr> </tbody> </table>	Value	Clock	00	18 MHz	01	49 MHz	02	55 MHz	03	60 MHz	04	66 MHz	05	76 MHz	06	99 MHz (only SDR mode)
Value	Clock																		
00	18 MHz																		
01	49 MHz																		
02	55 MHz																		
03	60 MHz																		
04	66 MHz																		
05	76 MHz																		
06	99 MHz (only SDR mode)																		
busy_bit_offset	60	4	SPI flash device busy bit offset in its status register, used for enabling the Quad mode of the SPI device																
Mode of operation of serial Flash	64	4	<p>This field describes the mode of operation of Serial flash</p> <table border="1"> <thead> <tr> <th>Value</th><th>Mode</th></tr> </thead> <tbody> <tr> <td>01</td><td>Single</td></tr> <tr> <td>02</td><td>Dual</td></tr> <tr> <td>04</td><td>Quad</td></tr> </tbody> </table>	Value	Mode	01	Single	02	Dual	04	Quad								
Value	Mode																		
01	Single																		
02	Dual																		
04	Quad																		
Serial Flash Port B Selection	68	4	<p>Port A is always available. This field informs the device ROM about the availability of Port B.</p> <p>0 – Port B is not used. 1 – Port B is used.</p>																
Dual Data Rate mode enable	72	4	<p>This field enables the device ROM to enable the DDR mode.</p> <p>0 – DDR mode is disabled. 1 – DDR mode is enabled.</p>																

*Table continues on the next page...*

**Table 8-23. QuadSPI configuration parameters (continued)**

Name	Offset	Size in bytes	Description
Data Strobe Signal enable in Serial Flash	76	4	This field enables the Data Strobe signal in the Serial flash which supports it. 0 – Disable DQS 1 – Enable DQS
Parallel Mode enable	80	4	This field enables the parallel mode. The data are read from the Serial flash in the parallel mode. Refer to the QSP chapter for details. 0 – Disable Parallel mode in QSPI 1 – Enable Parallel Mode in QSPI
CS1 on Port A	84	4	This field enables CS1 on port A 0 – Disable CS1 on Port A 1 – Enable CS1 on Port A
CS1 on Port B	88	4	This field enables CS1 on port B 0 – Disable CS1 on Port B 1 – Enable CS1 on Port B
Full Speed Phase Selection	92	4	Select the edge of the sampling clock valid for the full-speed commands: 0 - Select the sampling at the non-inverted clock 1 - Select the sampling at the inverted clock  This bit is also used to shift the dqs_enable when the DQS mode is selected.
Full Speed Delay Selection	96	4	Select the delay w.r.t. the reference edge for the sample point valid for full-speed commands: 0 - One clock cycle delay 1 - Two clock cycles delay  This bit is also used to shift the dqs_enable when the DQS mode is selected.
DDR Sampling Point	100	4	Select the sampling point for the incoming data when the serial flash is in the DDR mode.  <b>NOTE:</b> The valid values are (b000-b111)
LUT program sequence	104	256	256 bytes of the Look-Up Table program sequence. The ROM programs the LUT of QuadSPI with this parameter supplied.  It assumes that the optimize read command sequence which is used to read the data from the Serial flash and fill the AHB buffer is programmed at index 0.
read_status_ipcr	360	4	IPCR value of Read Status Reg
enable_dqs_phase	364	4	Enable DQS Phase
Reserved	368	36	Not used
dqs_pad_setting_override	404	4	DQS pin pad setting override
sclk_pad_setting_override	408	4	SCLK pin pad setting override
data_pad_setting_override	412	4	DATA pins pad setting override

*Table continues on the next page...*

**Table 8-23. QuadSPI configuration parameters (continued)**

Name	Offset	Size in bytes	Description
cs_pad_setting_override	416	4	CS pins pad setting override
dqs_loopback_internal	420	4	0 - dqs loopback from pad 1 - dqs loopback internally
dqs_phase_sel	424	4	dqs phase selection
dqs_fa_delay_chain_sel	428	4	dqs fa delay chain selection
dqs_fb_delay_chain_sel	432	4	dqs fb delay chain selection
sclk_fa_delay_chain_sel	436	4	sclk fa delay chain selection
sclk_fb_delay_chain_sel	440	4	sclk fb delay chain selection
Reserved	444	64	Reserved
tag	508	4	End flag of the QSPI parameters area

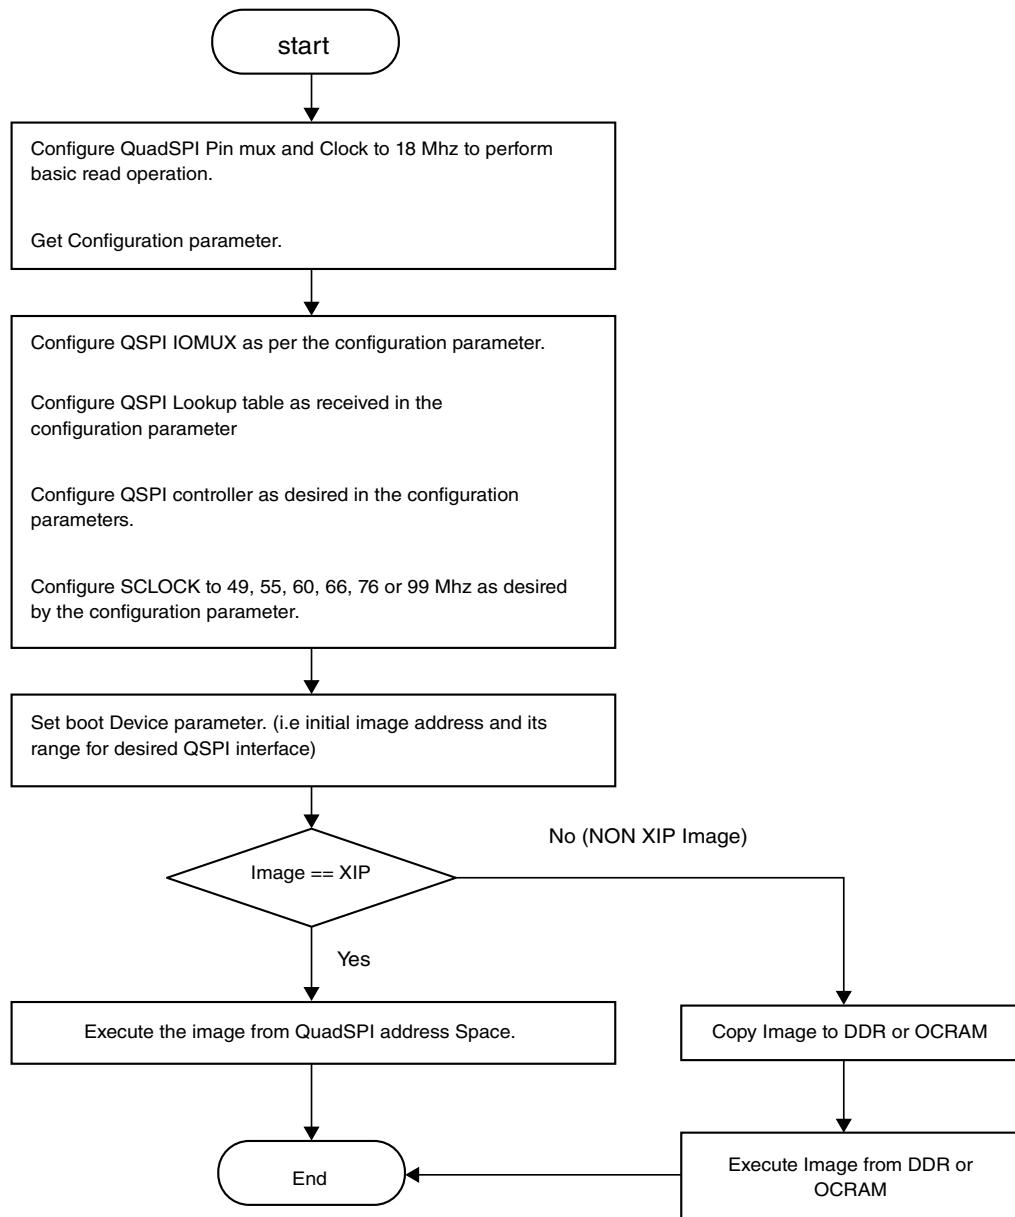

## 8.6.4 IOMUX configuration for QSPI devices

The QSPI interface uses the dedicated contacts on the IC. The contacts assigned to the data signals used by the QSPI are shown in these tables:

**Table 8-24. QuadSPI IOMUX pin configuration**

Signal	QSPI1
A_SCLK	NAND_WP_b.alt2
A_SS0_B	NAND_DQS.alt2
A_SS1_B	NAND_DATA07.alt2
A_DATA0	NAND_READY_B.alt2
A_DATA1	NAND_CE0_B.alt2
A_DATA2	NAND_CE1_B.alt2
A_DATA3	NAND_CLE.alt2
A_DQS	NAND_ALE.alt2
B_SCLK	NAND_RE_B.alt2
B_SS0_B	NAND_WE_B.alt2
B_SS1_B	NAND_DATA00.alt2
B_DATA0	NAND_DATA02.alt2
B_DATA1	NAND_DATA03.alt2
B_DATA2	NAND_DATA04.alt2
B_DATA3	NAND_DATA05.alt2
B_DQS	NAND_DATA01.alt2

## 8.6.5 QuadSPI boot flow chart

**Figure 8-20. QuadSPI boot flow chart**

### NOTE

If the flash is configured for the "high-performance mode" (where the command is generated only once) in the LUT program sequence, then the external reset must be routed to the flash reset to allow rebooting in case of a device reset different from the Power-On Reset. This high-performance mode must

be exited by the application before any low-power mode entry, where the device is supposed to reboot from QSPI flash on the low-power mode exit. In general, any preserved configuration in the external flash is not understood by the device after the reset.

## 8.7 Program image

This section describes the data structures that are required to be included in the user's program image. The program image consists of:

- Image vector table—a list of pointers located at a fixed address that the ROM examines to determine where the other components of the program image are located.
- Boot data—a table that indicates the program image location, program image size in bytes, and the plugin flag.
- Device configuration data—IC configuration data.
- User code and data.

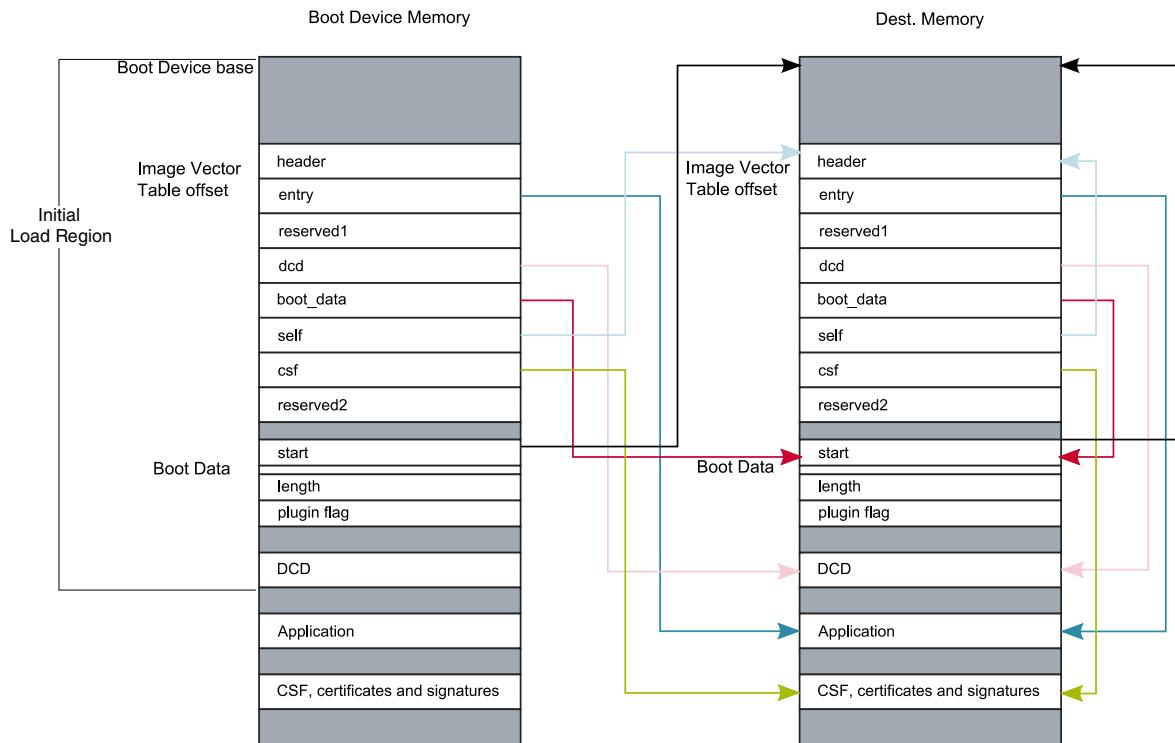

### 8.7.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder or the image memory map is flexible and is determined by the contents of the IVT.

**Table 8-25. Image Vector Table Offset and Initial Load Region Size**

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

**Figure 8-21. Image Vector Table**

### 8.7.1.1 Image vector table structure

The IVT has the following format where each entry is a 32-bit word:

**Table 8-26. IVT format**

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See <a href="#">Device Configuration Data (DCD)</a> for further details on the DCD.
boot data: Absolute address of the boot data
self: Absolute address of the IVT. Used internally by the ROM.
csf: Absolute address of the Command Sequence File (CSF) used by the HAB library. See <a href="#">High-Assurance Boot (HAB)</a> for details on the secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

[Figure 8-22](#) shows the IVT header format:

Tag	Length	Version
-----	--------	---------

**Figure 8-22. IVT header format**

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40 or 0x41

### 8.7.1.2 Boot data structure

The boot data must follow the format defined in the table found here, each entry is a 32-bit word.

**Table 8-27. Boot data format**

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see <a href="#">Plugin image</a> )

### 8.7.2 Device Configuration Data (DCD)

Upon reset, the chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving the optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is a configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various peripherals on the chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately after the reset. This allows the chip to interface with any NOR flash device, but has the disadvantage of slow performance. Additionally, some components (such as DDR) require some sequence of register programming as a part of the configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and the MMDC registers to the optimal settings.

## Program image

The ROM determines the location of the DCD table based on the information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big-endian byte array of the allowable DCD commands. The maximum size of the DCD is limited to 1768 B.

Header
[CMD]
[CMD]
...

**Figure 8-23. DCD data format**

The DCD header is 4 B with the following format:

Tag	Length	Version
-----	--------	---------

**Figure 8-24. DCD header format**

where:

Tag: A single-byte field set to 0xD2

Length: a two-byte field in the big-endian format containing the overall length of the DCD (in bytes) including the header

Version: A single-byte field set to 0x41

### 8.7.2.1 Write data command

The write data command is used to write a list of given 1-, 2- or 4-byte values (or bitmasks) to a corresponding list of target addresses.

The format of the write data command (in a big-endian byte array) is shown in this table:

**Table 8-28. Write data command format**

Tag	Length	Parameter
	Address	
	Value/Mask	

*Table continues on the next page...*

**Table 8-28. Write data command format (continued)**

[Address]
[Value/Mask]
...
[Address]
[Value/Mask]

where:

Tag: a single-byte field set to 0xCC

Length: a two-byte field in a big-endian format, containing the length of the Write Data Command (in bytes) including the header

Address: the target address to which the data must be written

Value/Mask: the data value (or bitmask) to be written to the preceding address

The parameter field is a single byte divided into the bitfields, as follows:

**Table 8-29. Write data command parameter field**

7	6	5	4	3	2	1	0
flags						bytes	

where

bytes: the width of the target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only specific bits may be overwritten at the target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes' and flags' parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

**Table 8-30. Interpretation of write data command flags**

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address != val_msk	Set bitmask

**NOTE**

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values are larger or any of the bitmasks are wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within the allowed region, none of the values are written. The list of allowable blocks and target addresses for the chip are provided below.

**Table 8-31. Valid DCD address ranges**

Address range	Start address	Last address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
IOMUXC GPR	0x020E4000	0x020E7FFF
CCM register set	0x020C4000	0x020C7FFF
ANADIG registers	0x020C8000	0x020C8FFF
MMDC register set	0x021B0000	0x021B3FFF
OCRAM free space	0x00907000	0x00917FF0
EIM registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFF7FFF
EPIT	EPIT1: 0x020D0000	EPIT1: 0x020D3FFF

**8.7.2.2 Check data command**

The check data command is used to test for a given 1-, 2-, or 4-byte bitmasks from a source address.

The check data command is a big-endian byte array with the format shown in this table:

**Table 8-32. Check data command format**

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: a single-byte field set to 0xCF

Length: a two-byte field in the big-endian format containing the length of the check data command (in bytes) including the header

Address: the source address to test

Mask: the bit mask to test

Count: an optional poll count; If the count is not specified, this command polls

indefinitely

until the exit condition is met. If count = 0, this command behaves as for the NOP.

The parameter field is a single byte divided into bitfields, as follows:

**Table 8-33. Check data command parameter field**

7	6	5	4	3	2	1	0
flags				bytes			

where

bytes: the width of target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only the specific bits may be overwritten at a target address  
(otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag  
(otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

**Table 8-34. Interpretation of check data command flags**

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask)!= mask	Any bit clear
1	1	(*address & mask)!= 0	Any bit set

### NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

### 8.7.2.3 NOP command

This command has no effect.

The format of the NOP command is a big-endian four-byte array, as shown in this table:

**Table 8-35. NOP command format**

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: a single-byte field set to 0xC0

Length: a two-byte field in big endian containing the length of the NOP command in bytes (fixed to a value of 4)

Undefined: this byte is ignored and can be set to any value.

#### 8.7.2.4 Unlock command

The unlock command is used to prevent specific engine features from being locked when exiting the ROM.

The format of the unlock command (in a big-endian byte array) is shown in this table:

**Table 8-36. Unlock command format**

Tag	Length	Eng
	Value	
	Value	
	...	
	Value	

where:

Tag: a single-byte field set to 0xB2

Eng: the engine to be left unlocked

Values: [optional] the unlock values required by the engine

#### NOTE

This command may not be used in the DCD structure if the SEC\_CONFIG is configured as closed.

## 8.8 Plugin image

The ROM supports a limited number of boot devices. When using other devices as a boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) as a firmware to provide the missing boot drivers.

Additionally, the plugin can be customized to support boot drivers, which is more flexible when performing the device initialization, such as condition judging, delay assertion, or to apply custom settings to the boot device and memory system.

In addition to the standard images, the chip also supports plugin images. The plugin images return the execution to the ROM whereas the standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot data structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end, the plugin function must return with the program image parameters. (See [High-level boot sequence](#) for details about the boot flow).

The boot ROM authenticates the plugin image before running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32
*iwt_offset);
```

#### ARGUMENTS PASSED:

- start - the image load address on exit.
- bytes - the image size on exit.
- iwt\_offset - the offset (in bytes) of the IVT from the image start address on exit.

#### RETURN VALUE:

- 1 - success
- 0 - failure

## 8.9 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB and UART serial connection.

In this mode, the ROM programs the WDOG1 for a time-out specified by the fuse WDOG Time-out Select (See fusemap for details) if the WDOG\_ENABLE eFuse is 1 and continuously polls for the USB and UART connection. If no activity is found on the USB OTG1 and UART 1/2 and the watchdog timer expires, the Arm core is reset.

### NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

## **Serial Downloader**

This figure shows the USB and UART boot flow:

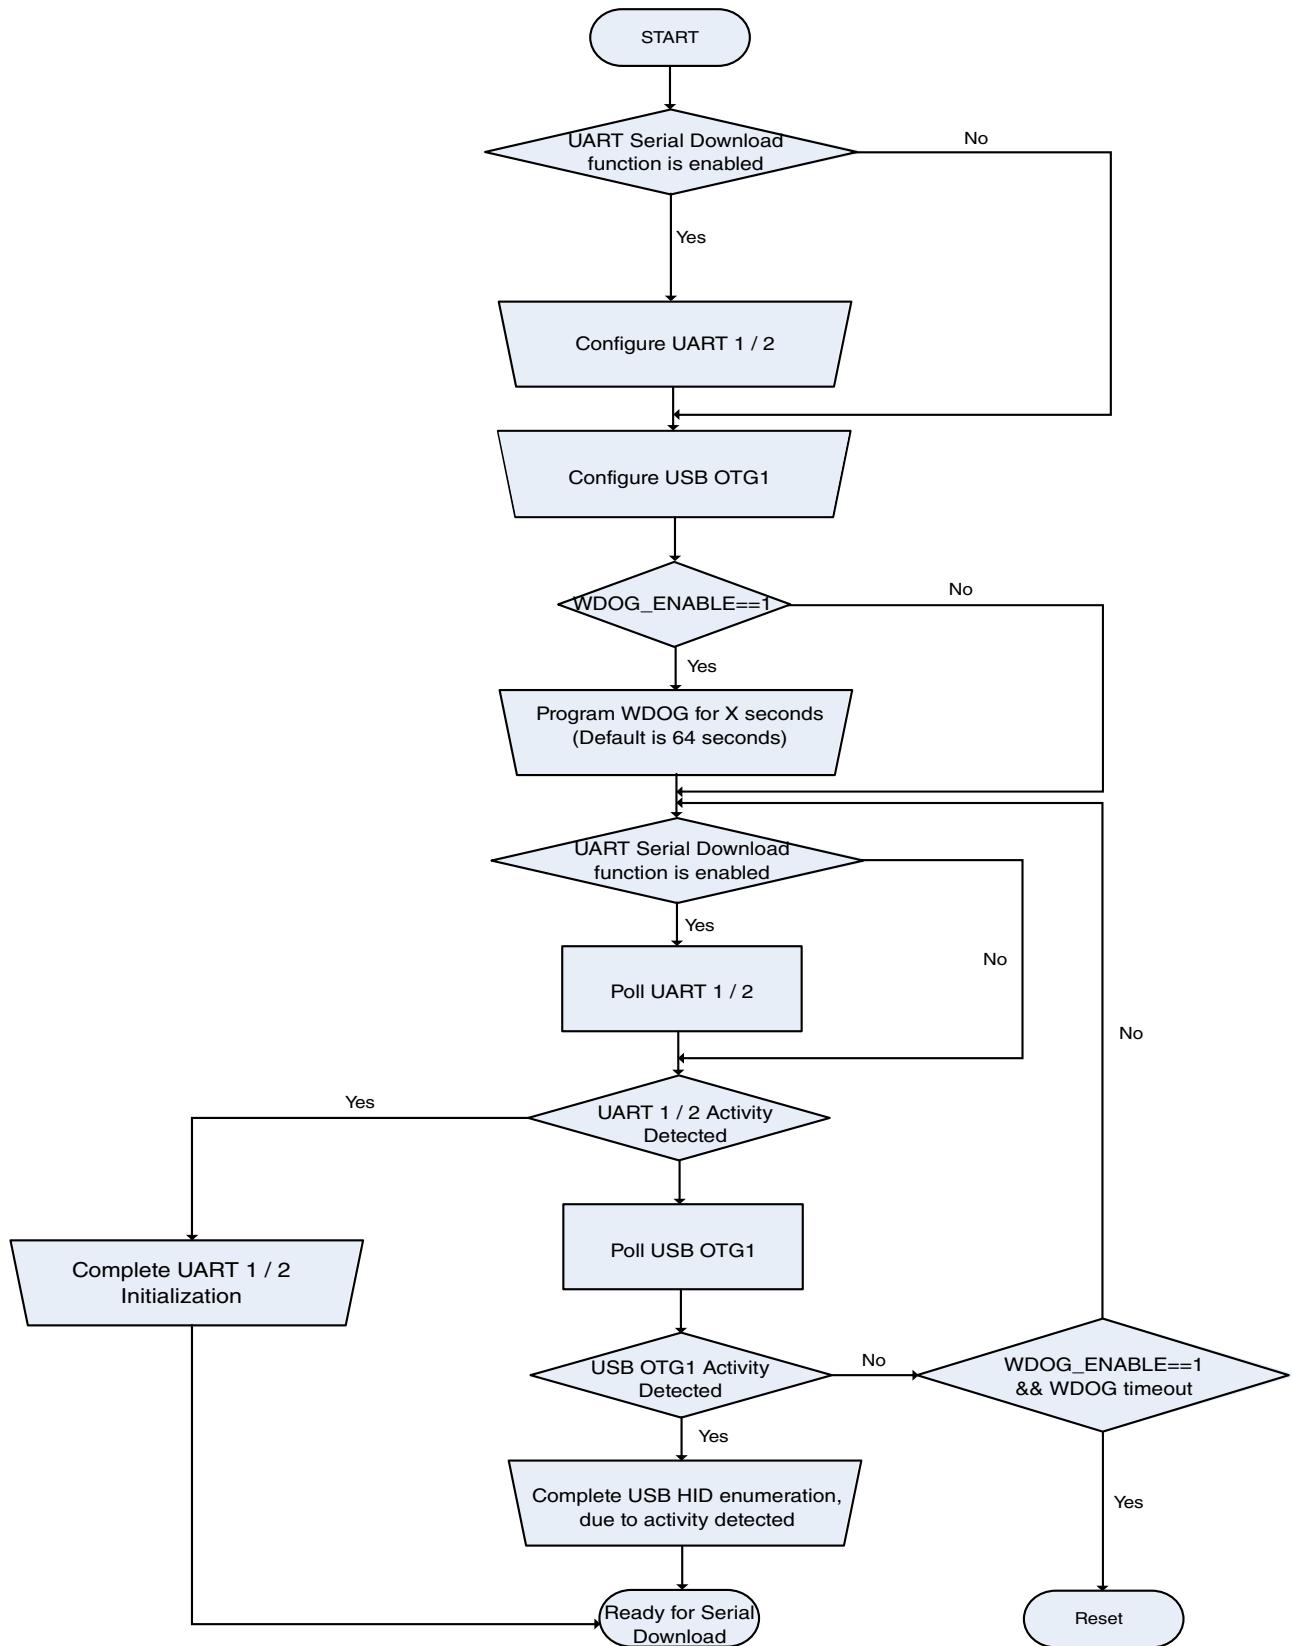

Figure 8-25. Serial Downloader boot flow

## 8.9.1 USB

The USB support is composed of the USBOH3USBO2 (USB OTG1USB OTG core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of four HID reports are used to implement the SDP protocol for data transfers, as described in [Table 8-37](#).

**Table 8-37. USB HID reports**

Report ID (first byte)	Transfer endpoint	Direction	Length	Description
1	control OUT	Host to device	17 B	SDP command from the host to the device.
2	control OUT	Host to device	Up to 1025 B	Data associated with the report 1 SDP command.
3	interrupt	Device to host	5 B	HAB security configuration. The device sends 0x12343412 in the closed mode and 0x56787856 in the open mode.
4	interrupt	Device to host	Up to 65 B	Data in response to the SDP command in report 1.

### 8.9.1.1 USB configuration details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for the USB device driver are listed in the following table.

**Table 8-38. VID/PID and strings for USB device driver**

Descriptor	Value
VID	0x15A2 (NXP vendor ID)
PID <sup>1</sup>	0x007D

*Table continues on the next page...*

**Table 8-38. VID/PID and strings for USB device driver (continued)**

Descriptor	Value
String Descriptor1 (manufacturer)	NXP Semiconductors
String Descriptor2 (product)	S Blank SE Blank NS Blank
String Descriptor4	NXP Flash
String Descriptor5	NXP Flash

1. Allocation based on the BPN (Before Part Number)

### 8.9.1.2 IOMUX configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses the dedicated contacts on the IC. See the chip data sheet for details.

## 8.9.2 UART

The ROM supports the UART1 and UART2 ports for boot purposes. The other UART ports on the chip are not supported for boot purposes.

If an event of data ready in the UART FIFO is detected, the ROM enters the UART serial download boot mode, and starts to read the data from the UART port which reports the data ready event. The noise on the UART RX data pad may cause a “data ready” event reported by the UART controller, and further cause the ROM to enter the UART serial download mode. Hardware designers must take care to avoid such exception.

### 8.9.2.1 UART configuration details

**Table 8-39. UART configuration details**

Transmission protocol	RS232
Start bit	1 bit
Stop bit	1 bit
Parity bit	No needed
Flow control	No needed
Baud rate	115200 bps

### 8.9.2.2 UART eFUSE configuration

**Table 8-40. UART eFUSE configuration**

Fuse	Config	Definition	GPIO	Shipped value	Settings
0x470[4]	OEM	UART Serial Download Disabled Selection	Yes	0	0 - UART serial download enabled 1 - disabled

### 8.9.2.3 IOMUX configuration for UART

**Table 8-41. IOMUX configuration for UART**

Signal	UART1	UART2
TXD	UART1_TX_DATA.alt0	UART2_TX_DATA.alt0
RXD	UART1_RX_DATA.alt0	UART2_RX_DATA.alt0

### 8.9.3 Serial Download Protocol (SDP)

The 16-byte SDP command from the host to device is sent using the HID report 1.

This table describes the 16-byte SDP command data structure:

**Table 8-42. 16-byte SDP command data structure**

BYTE offset	Size	Name	Description
0	2	COMMAND TYPE	These commands are supported for the ROM: <ul style="list-style-type: none"> <li>• 0x0101 READ_REGISTER</li> <li>• 0x0202 WRITE_REGISTER</li> <li>• 0x0404 WRITE_FILE</li> <li>• 0x0505 ERROR_STATUS</li> <li>• 0xA0A DCD_WRITE</li> <li>• 0xB0B JUMP_ADDRESS</li> <li>• 0xC0C SKIP_DCD_HEADER</li> </ul>
2	4	ADDRESS	Only relevant for these commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS.

*Table continues on the next page...*

**Table 8-42. 16-byte SDP command data structure (continued)**

BYTE offset	Size	Name	Description
			For the READ_REGISTER and WRITE_REGISTER commands, this field is the address to a register. For the WRITE_FILE and JUMP_ADDRESS commands, this field is an address to the internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for an 8-bit access, 0x10 for a 16-bit access, and 0x20 for a 32-bit access. Only relevant for the READ_REGISTER and WRITE_REGISTER commands.
7	4	DATA COUNT	Size of the data to read or write. Only relevant for the WRITE_FILE, READ_REGISTER, WRITE_REGISTER, and DCD_WRITE commands. For the WRITE_FILE and DCD_WRITE commands, the DATA COUNT is in the byte units.
11	4	DATA	The value to write. Only relevant for the WRITE_REGISTER command.
15	1	RESERVED	Reserved

### 8.9.3.1 SDP commands

The SDP commands are described in the following sections.

#### 8.9.3.1.1 READ\_REGISTER

The transaction for the READ\_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration, and Report4 for the response or the register value.

The register to read is specified in the ADDRESS field of the SDP command. The first device sends Report3 with the security configuration followed by the Report4 with the bytes read at a given address. If the count is greater than 64, multiple reports with the report id 4 are sent until the entire data requested by the host is sent. The STATUS is either 0x12343412 for the closed parts and 0x56787856 for the open or field return parts.

Report1, Command, Host to Device:

1	Valid values for the READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register value
---	----------------

ID 4 bytes of data containing the register value. If the number of bytes requested is less than 4, the remaining bytes must be ignored by the host.

Multiple reports of the report id 4 are sent until the entire requested data is sent.

Report4, Response, Device to Host: last response report

4	Register value
---	----------------

ID 64 bytes of data containing the register value. If the number of bytes requested is less than 64, the remaining bytes must be ignored by the host.

### 8.9.3.1.2 WRITE\_REGISTER

The transaction for the WRITE\_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration and Report4 for the write status.

The host sends Report1 with the WRITE\_REGISTER command. The register to write is specified in the ADDRESS field of the SDP command of Report1, with the FORMAT field set to the data type (number of bits to write, either 8, 16, or 32) and the value to write in the DATA field of the SDP command. The device writes the DATA to the register address and returns the WRITE\_COMPLETE code using Report4 and the security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	4 bytes indicating the security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with the first 4 bytes to indicate that the write is completed with code 0x128A8A12. On failure, the device reports the HAB error status.

### 8.9.3.1.3 WRITE\_FILE

The transaction for the WRITE\_FILE command consists of these reports: Report1 for the command phase, Report2 for the data phase, Report3 for the HAB mode, and Report4 to indicate that the data are received in full.

The size of each Report2 is limited to 1024 bytes (limitation of the USB HID protocol). Hence, multiple Report2 packets are sent by the host in the data phase until the entire data is transferred to the device. When the entire data (DATA\_COUNT bytes) is received, the device sends Report3 with the HAB mode and Report4 with 0x88888888, indicating that the file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP command

=====Optional Begin=====

Host sends the ERROR\_STATUS command to query if the HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

## Serial Downloader

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with the first four bytes to indicate that the file download completed with code 0x88888888. On failure, the device reports the HAB error status.

### 8.9.3.1.4 ERROR\_STATUS

The transaction for the SDP command ERROR\_STATUS consists of three reports.

Report1 is used by the host to send the command; the device sends global error status in four bytes of Report4 after returning the security configuration in Report3. When the device receives the ERROR\_STATUS command, it returns the global error status that is updated for each command. This command is useful to find out whether the last command resulted in a device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	Four bytes Error status
---	-------------------------

ID first 4 bytes status in 64 bytes Report4

### 8.9.3.1.5 DCD\_WRITE

The SDP command DCD\_WRITE is used by the host to send multiple register writes in one shot. This command is provided to speed up the process of programming the register writes (such as to configure an external RAM device).

The command goes with Report1 from the host with COMMAND TYPE set to DCD\_WRITE, ADDRESS which is used as a temporary location of the DCD data, and DATA\_COUNT to the number of bytes sent in the data out phase. In the data phase, the host sends the data for a number of registers using Report2. The device completes the transaction with Report3 indicating the security configuration and Report4 with the WRITE\_COMPLETE code 0x128A8A12.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with the first four bytes to indicate that the write completed with the code 0x128A8A12. On failure, the device reports the HAB error status.

See [Device Configuration Data \(DCD\)](#) for the DCD format description.

### 8.9.3.1.6 SKIP\_DCD\_HEADER

The SDP command SKIP\_DCD\_HEADER is used by the host to inform the device to skip the DCD configuration within the download image.

## Serial Downloader

If the download image must be run on the DDR, the DCD configuration data must be built into the image. In case the host issued DCD\_WRITE to push the DCD configuration data to the device for the DDR initialization, the image with the DCD information causes the ROM to initialize the DDR twice, and may cause the initialization processing to hang.

The SKIP\_DCD\_HEADER command informs the device to skip the DCD configuration within the download image and avoid this issue.

This command is typically sent after JUMP\_ADDRESS. This command is sent by the host in the command-phase of the transaction using Report1, there is no data phase for this command. The device completes the transaction with Report3 indicating the security configuration and Report4 with the OK\_ACK code 0x900DD009.

Report1, Command, Host to Device:

1	SKIP_DCD_HEADER
---	-----------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	OK_ACK (0x900DD009)
---	---------------------

### 8.9.3.1.7 JUMP\_ADDRESS

The SDP command JUMP\_ADDRESS is the last command that the host can send to the device. After this command, the device jumps to the address specified in the ADDRESS field of the SDP command and starts to execute.

This command usually follows after the WRITE\_FILE command. The command is sent by the host in the command-phase of the transaction using Report1. There is no data phase for this command, but the device sends the status Report3 to complete the transaction. If the authentication fails, it also sends Report4 with the HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

This report is sent by the device only in case of an error jumping to the given address, or if the device reports error in Report4, Response, Device to Host:

4	Four bytes HAB error status
---	-----------------------------

ID 4 bytes status, 64 bytes report length

## 8.10 Recovery devices

The chip supports recovery devices. If the primary boot device fails, the boot ROM tries to boot from the recovery device using one of the ECSPI ports.

To enable the recovery device, the BOOT\_CFG4[6] fuse must be set. Additionally, the serial EEPROM fuses must be set as described in [Serial ROM through SPI](#).

## 8.11 USB low-power boot

The ROM supports the USB low-power boot. This feature enables a device with a dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter if the upstream port is a USB charger or a USB host/hub.

If a USB dedicated charger or a host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (max.1.5 A) can be supplied by the charger. If a USB host/hub is connected, a maximal current of 100 mA is supplied to the device and the device is able to power up to boot the image with less than 100 mA.

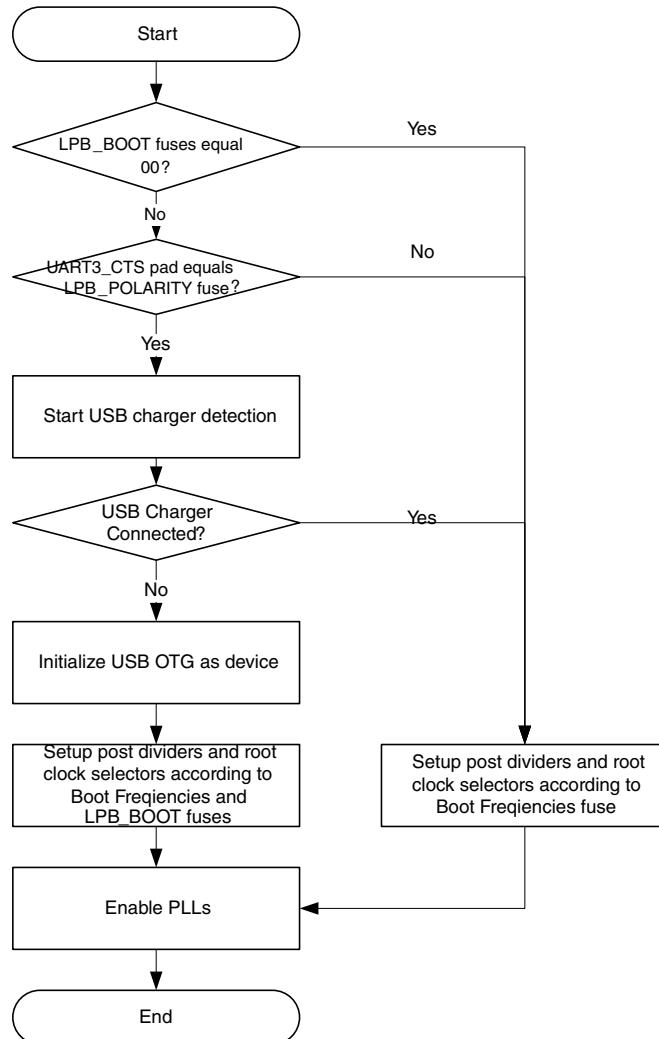

If the LPB\_BOOT fuses are blown, the chip checks if there is a low-power condition via the UART3\_CTS (as GPIO1\_26) pad. If there is a low-power boot condition, the USB charger detection is activated. If there is no USB charger, the ROM initializes the USB as a device and applies division factors on the Arm, DDR, AXI, and AHB root clocks based on the LPB\_BOOT fuses value (see the table below). The polarity of the low-power boot condition on the UART3\_CTS (as GPIO1\_26) pad is set by the BT\_LPB\_POLARITY fuse (see the following figure).

**Table 8-43. USB low-power bus boot frequencies**

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
0	MMDC_CLK_ROOT = 396 MHz FABRIC_CLK_ROOT = 198 MHz AHB_CLK_ROOT = 132 MHz	MMDC_CLK_ROOT = 307 MHz FABRIC_CLK_ROOT = 153 MHz AHB_CLK_ROOT = 102 MHz
1	MMDC_CLK_ROOT = 396 MHz FABRIC_CLK_ROOT = 198 MHz AHB_CLK_ROOT = 132 MHz	MMDC_CLK_ROOT = 307 MHz FABRIC_CLK_ROOT = 153 MHz AHB_CLK_ROOT = 102 MHz
10	MMDC_CLK_ROOT = 198 MHz FABRIC_CLK_ROOT = 99 MHz AHB_CLK_ROOT = 66 MHz	MMDC_CLK_ROOT = 153 MHz FABRIC_CLK_ROOT = 76 MHz AHB_CLK_ROOT = 51 MHz
11	Reserved	Reserved

**Table 8-44. USB low-power CPU boot frequencies**

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
0	ARM_CLK_ROOT = 396 MHz	ARM_CLK_ROOT = 198 MHz
1	ARM_CLK_ROOT = 396 MHz	ARM_CLK_ROOT = 198 MHz
10	ARM_CLK_ROOT = 198 MHz	ARM_CLK_ROOT = 99 MHz
11	Reserved	Reserved

**Figure 8-26. USB low-power boot flow**

## 8.12 SD/MMC manufacture mode

When the internal boot and recover boot (if enabled) failed, the SDMMC\_MFG\_DISABLE fuse bit isn't set and the EEPROM recovery fuse bit is set, the boot goes to the SD/MMC manufacture mode before the serial download mode. In the manufacture mode, one bit bus width is used despite of the fuse setting.

In the manufacture mode, the SD or MMC card will be scanned on the uSDHC1. If a card is detected and a valid boot image is found in the card, the boot image is loaded and executed. Pad of SD1\_CD is used to detect whether a card is inserted or not.

## High-Assurance Boot (HAB)

By default, the SD/MMC manufacture mode is enabled. Blow the fuse of the DISABLE\_SDMMC\_MFG to disable it.

### NOTE

A secondary boot is not supported in the SD/MMC manufacture mode.

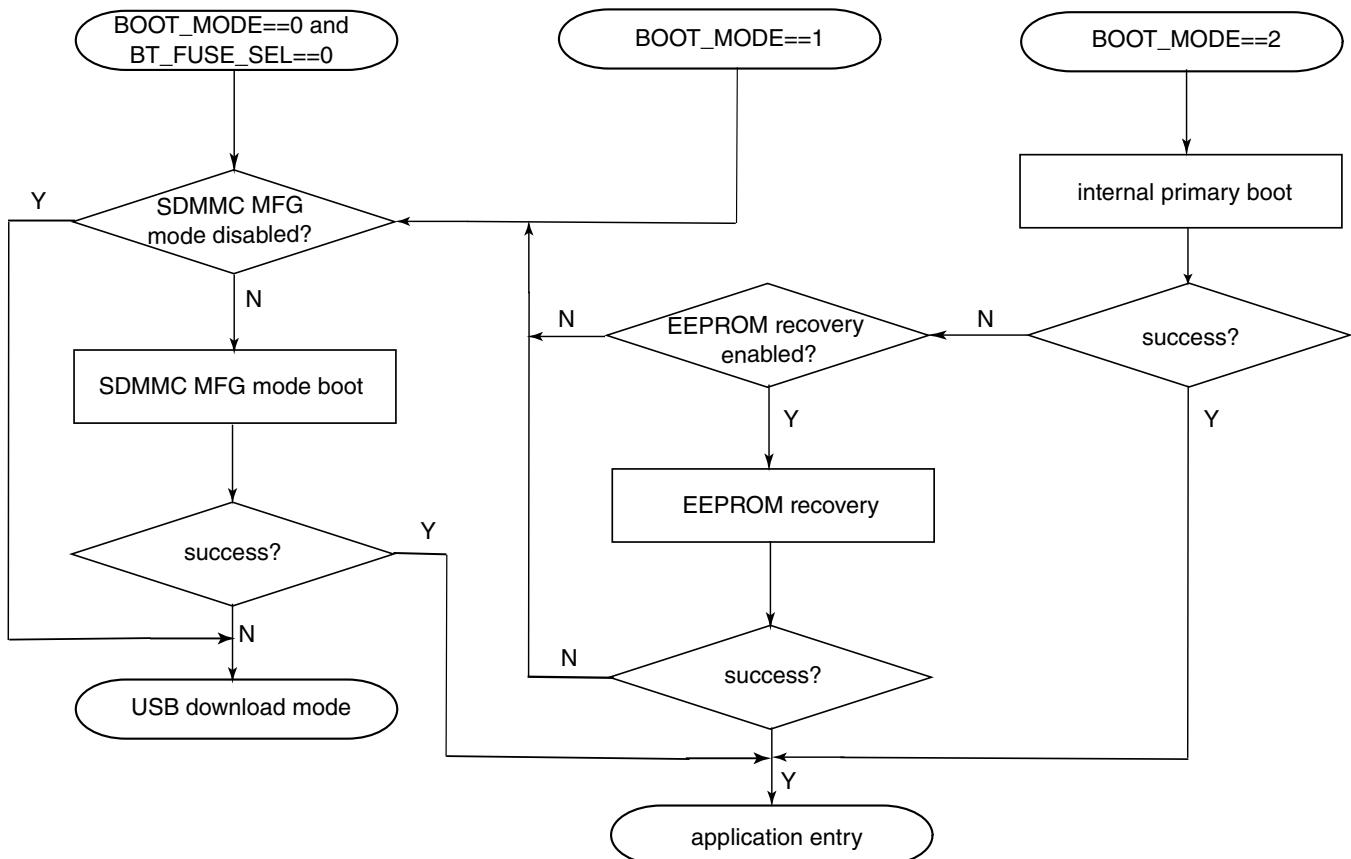

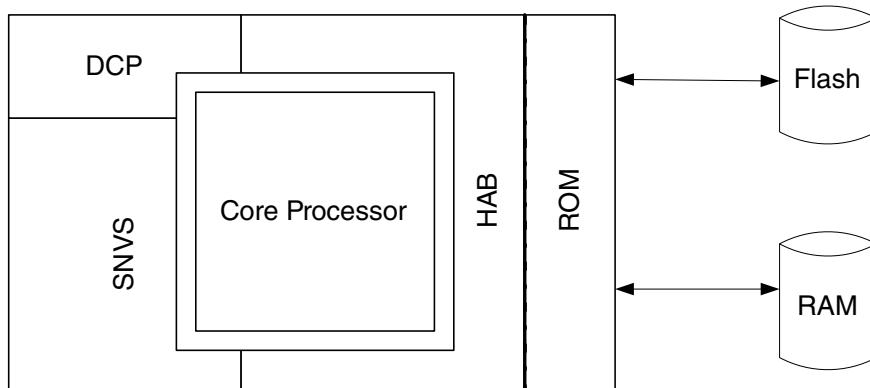

Figure 8-27. SD/MMC manufacture boot flow

## 8.13 High-Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying the areas of code or data in the programmable memory to make it behave in an incorrect manner. The HAB also prevents the attempts to gain access to features which must not be available.

The integration of the HAB feature with the ROM code ensures that the chip does not enter an operational state if the existing hardware security blocks detected a condition that may be a security threat or if the areas of memory deemed to be important were modified. The HAB uses the RSA digital signatures to enforce these policies.

**Figure 8-28. Secure boot components**

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to make sure that the system security state is as expected. The HAB includes a software implementation of SHA-256 for cases where a hardware accelerator can't be used. The RSA key sizes supported are 1024, 2048, and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by the HAB are:

- X.509 public key certificate support
- CMS signature format support

#### NOTE

NXP provides the reference Code Signing Tool (CST) for key generation, certificate generation, and code signing for use with the HAB library. The CST can be found by searching for "IMX\_CST\_TOOL" at <http://www.nxp.com>.

#### NOTE

For further details on using the secure boot feature using HAB, contact your local NXP representative.

### 8.13.1 HAB API vector table addresses

For devices that perform a secure boot, the HAB library may be called by the boot stages that execute after the ROM code.

The RVT table contains the pointers to the HAB API functions and is located at 0x00000100.

**NOTE**

For additional information on the secure boot including the HAB API, contact your local NXP representative.

# Chapter 9

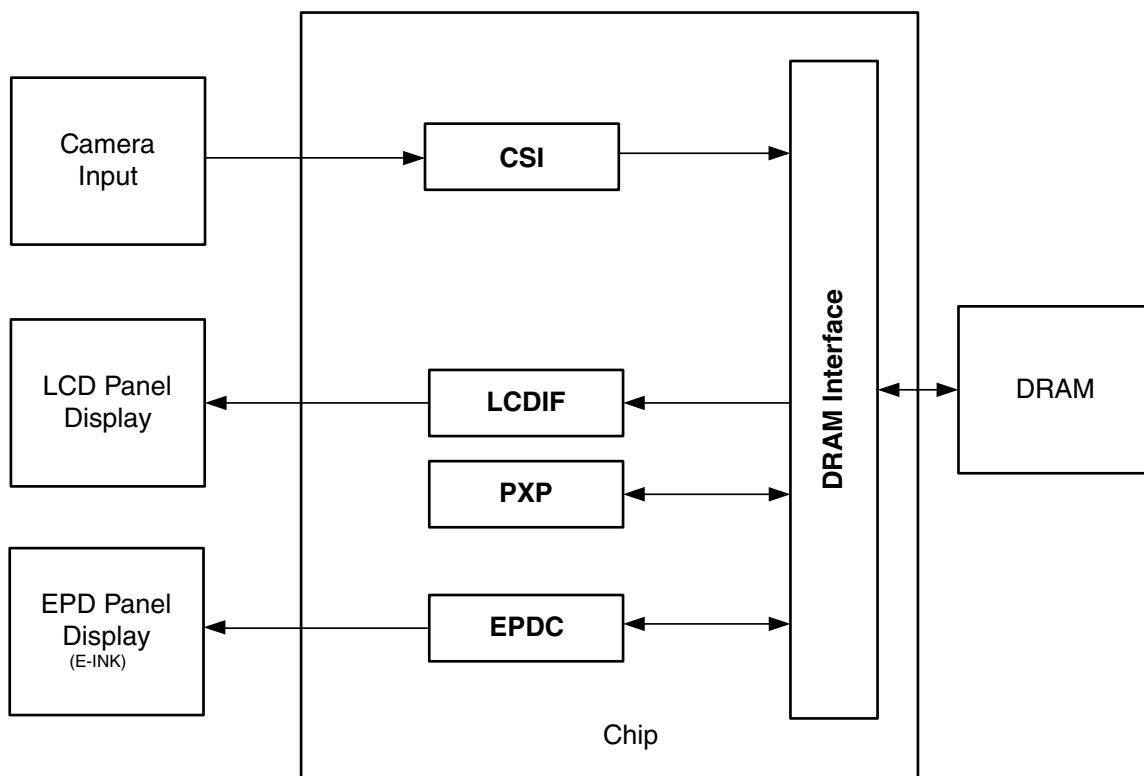

## Multimedia

### 9.1 Display and graphics subsystem

The chip display and graphics subsystem consists of the dedicated modules found here.

- EPDC (electrophoretic display controller): display controller for E-INK EPD panel
- LCD Interface (LCDIF): 24-bit parallel RGB LCD interface
- PXP pixel pipeline: pixel/image processing engine for LCD display
- Camera Sensor Interface (CSI): up to 24-bit parallel interface for image sensor

The following figure shows the high-level integration scheme of the chip display and graphics system.

**Figure 9-1. Chip display and graphics subsystem**

### 9.1.1 Electrophoretic Display Controller

The EPDC is a feature-rich, low power, and high-performance direct-drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution whilst reaching much higher levels of performance and lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the ePXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- Supports direct-driver for E-Ink EPD panels, with up to 2048x1536 resolution at 106 Hz refresh rate (or 4096x4096 resolution at 20 Hz refresh rate)
- Supports up to 64 LUT for concurrent update
- Supports automatic waveform selection based on both input image and current panel content
- Supports collision detection
- Supports both PVI panels and LGD GIP panels.

## 9.1.2 PiXel Processing Pipeline (PXP)

The pixel processing pipeline is used to perform image processing on image/video buffers before sending to an LCD display.

The main features of PXP include:

- Multiple input/output format support, including YUV/RGB/Grayscale
- Supports both RGB/YUV scaling
- Supports overlay with Alpha blending

## 9.1.3 LCD Interface (LCDIF)

The LCDIF is a general purpose display controller that is used to drive a wide range of display devices. These displays can vary in size and capability. Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The LCDIF block supports these different interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh and a DMA interface to manage input data transfers from the LCD requiring minimal CPU overhead.
- 8/16/18/24 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

## 9.1.4 CMOS Sensor Interface (CSI)

## Audio subsystem

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

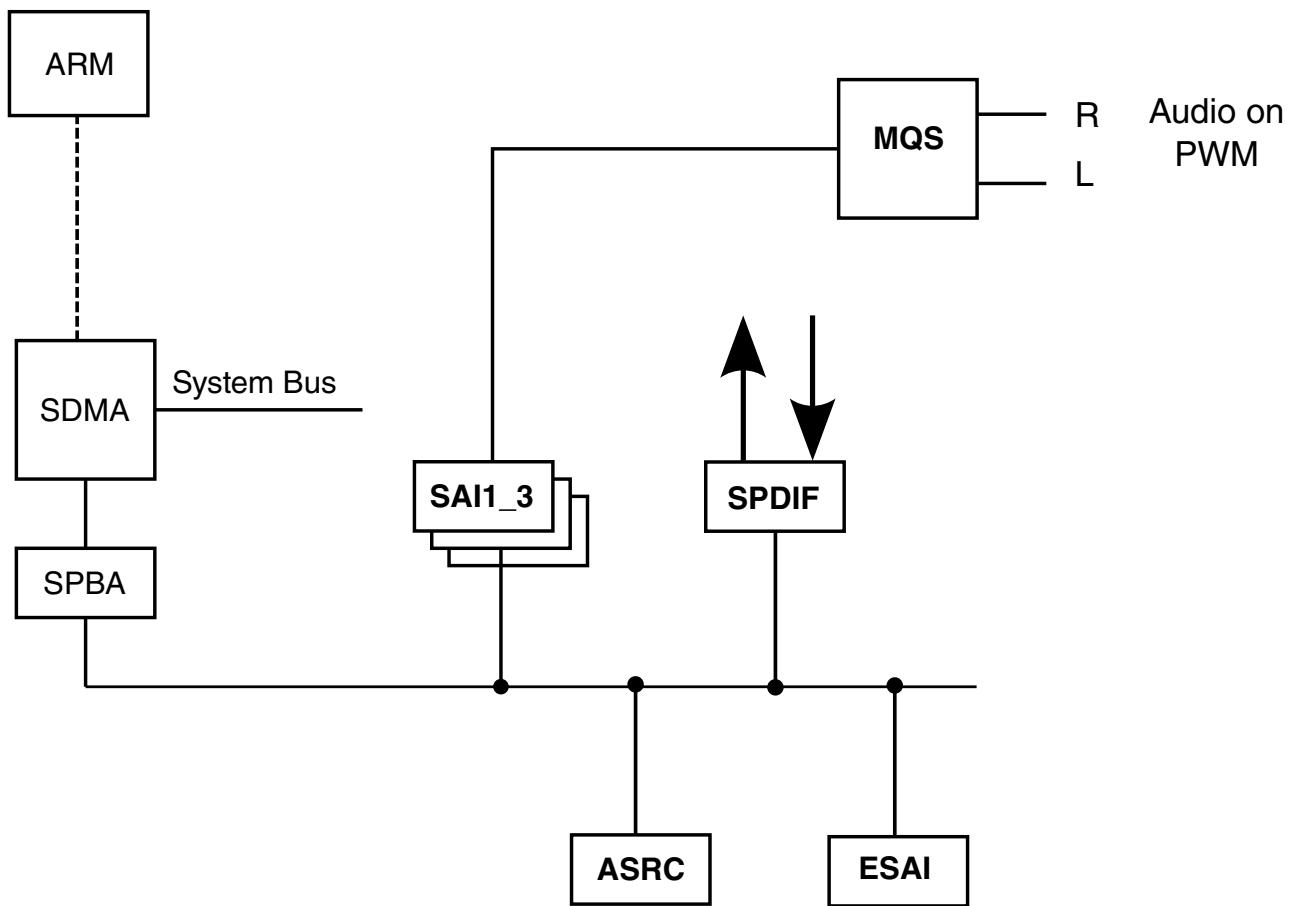

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCC, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support for 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support for double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources:
  - Start of Frame
  - End of Frame
  - Change of Field
  - FIFO full
  - FIFO overrun
  - DMA transfer done
  - CCIR error
  - AHB bus response error
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

## 9.2 Audio subsystem

[Audio Subsystem Module Overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

### 9.2.1 Audio Subsystem Module Overview

The following figure shows a high level block diagram of the audio subsystem.

**Figure 9-2. Audio subsystem block diagram**

AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

ASRC (asynchronous sample rate converter) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of over 120dB THD+N.

The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs. ASRC is connected to the shared peripheral bus.

## 9.2.2 Medium Quality Sound (MQS)

MQS is used to generate medium quality audio via a standard GPIO in the pinmux. The user can connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

- 2-channel, MSB-valid 16 bit, MSB first
- Frame sync aligned with the left channel data
- 44.1 kHz or 48 kHz I2S signals from SAI1
- SNR target as no more than 20 dB for the signals below 10 kHz
- Signals Over 10 kHz have worse THD + N values

## 9.2.3 Synchronous Audio Interface (SAI)

- Transmitter with independent Bit Clock and Frame Sync supporting 1 data line
- Receiver with independent Bit Clock and Frame Sync supporting 1 data line
- Maximum Frame Size of 32 Words
- Word size programmable from 8-bits to 32-bits
- Word size configured separately for first word and remaining words in frame
- Asynchronous FIFO for each Transmit and Receive data line
- Graceful restart after FIFO Error

## 9.2.4 Enhanced Serial Audio Interface (ESAI)

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The ESAI has 12 pins for data and clocking connection to external devices. The ESAI is internally connected to the ESAI\_BIFIFO, and does not connect directly to the shared peripheral bus. The ESAI interface is designed for a 24-bit data bus, while the shared peripheral data bus is 32-bit wide. Also, the ESAI data paths are only double buffered, not allowing efficient DMA service in the applications processor environment. The ESAI\_BIFIFO allows increasing the data buffering and data width matching to the shared peripheral bus.

## 9.2.5 Sony/Philips Digital Interface (SPDIF)

The SPDIF module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. The chip provides one SPDIF transmitter with one output and one SPDIF receiver with four inputs.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIIFTxLeft and SPDIIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphase mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The clock sources should provide a clock that is at least  $64 \times F_s$ , where  $F_s$  is the sampling frequency. The external clock source should provide at least  $128 \times F_s$ . Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example, 128x, 256x or 512x). Also, clock frequency precision of 100ppm or better should be provided.

## 9.2.6 Asynchronous Sample Rate Converter (ASRC)

The incoming audio data may be received from various sources at different sampling rates. The outgoing audio data may have different sampling rates, and it can also be associated to output clocks that are asynchronous to the input clocks.

ASRC converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sampling rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. ASRC supports up to 3 sampling rate pairs.

In the real-time audio use case, both input/output sampling rate clocks are activated. Both sampling rate clocks are directly connected to ASRC, and the ratio estimation of the input clocks to output clocks is used to perform the sample rate conversion in ASRC hardware.

The SAI1, SAI2, SAI3, and SPDIF audio modules can act as either a clock master or a clock slave. Multiplexors are provided on a chip level to select which of the module's clock signal, input or output, will be connected to ASRC input in dependence of the module's operational mode as it is shown in [Figure 9-3](#) and [Table 9-1](#). [Figure 9-3](#) presents the multiplexor cell used for all ASRC input clocks. [Table 9-1](#) shows the detailed clocks, multiplexor control and data bits for each ASRC input clock. For the audio blocks clocks that are directly connected to ASRC (without the multiplexor scheme) see [Table 9-2](#).

In the non-real time streaming audio use case, the input sampling rate clock does not need to be provided. Instead the ideal-ratio value conversion is set in the ASRC interface registers. In this case only the output sampling rate clock must be provided, and the fixed ratio of the input to the output in the register is used to perform the sample rate conversion.

# Chapter 10

## Clock and Power Management

### 10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

### 10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

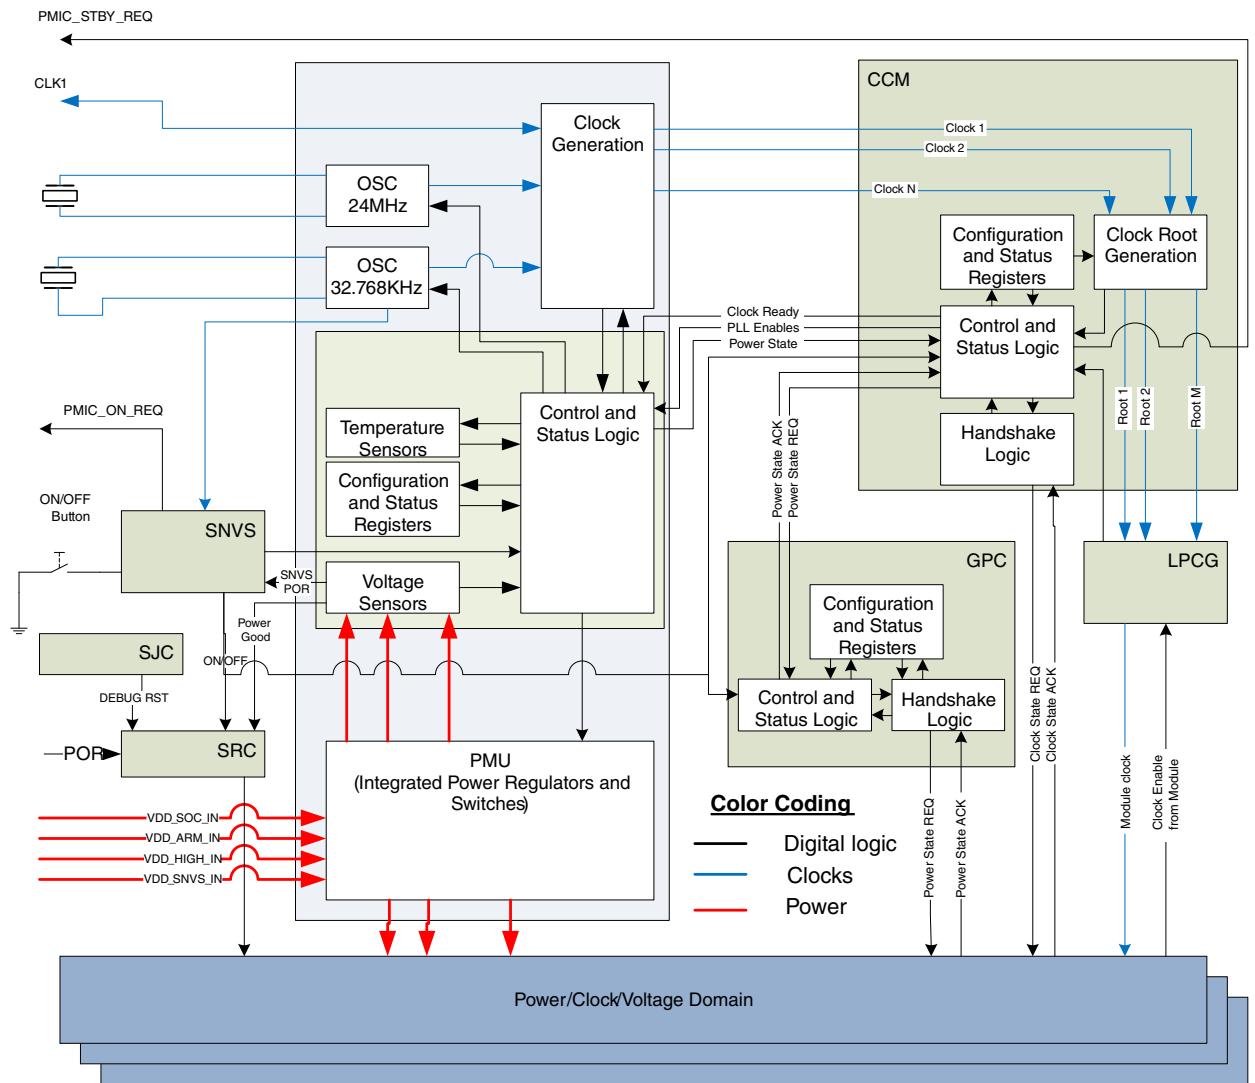

Figure 10-1. Power and clock management framework

## 10.2.1 Centralized components of clock generation and management

Centralized components of the clock generation and management sub-system are implemented in the following blocks:

- **CCM (Clock Control Module):** The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating. See [Clock Controller Module \(CCM\)](#) for

- information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

## 10.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management sub-system are implemented in the following blocks:

- Power Management Unit (PMU). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- General Power Controller (GPC). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

## 10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

## 10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

### NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

## 10.3 Clock Management

### 10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

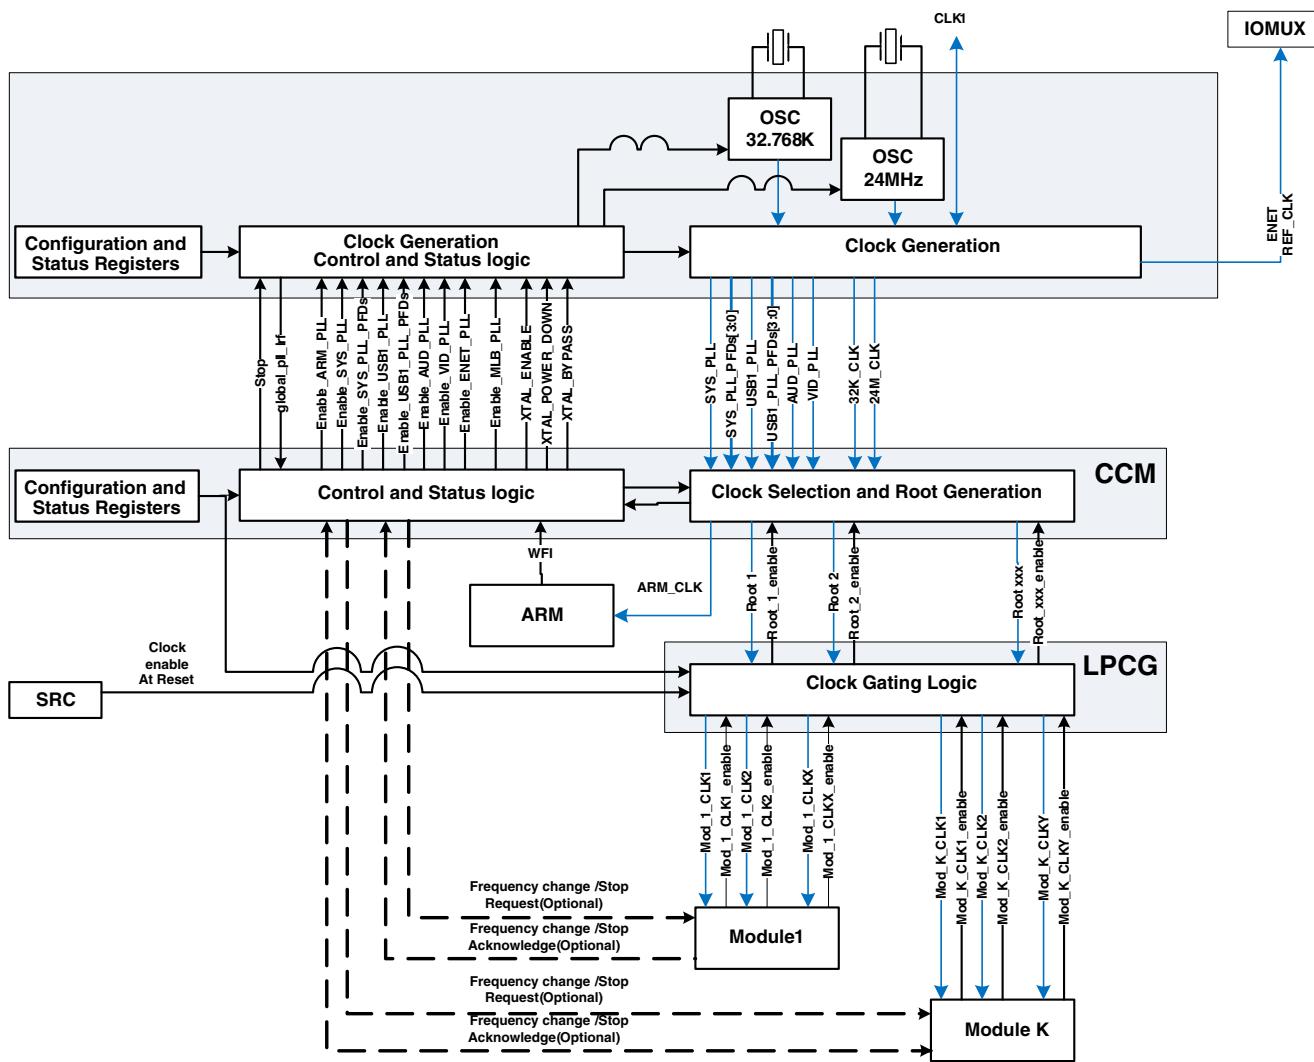

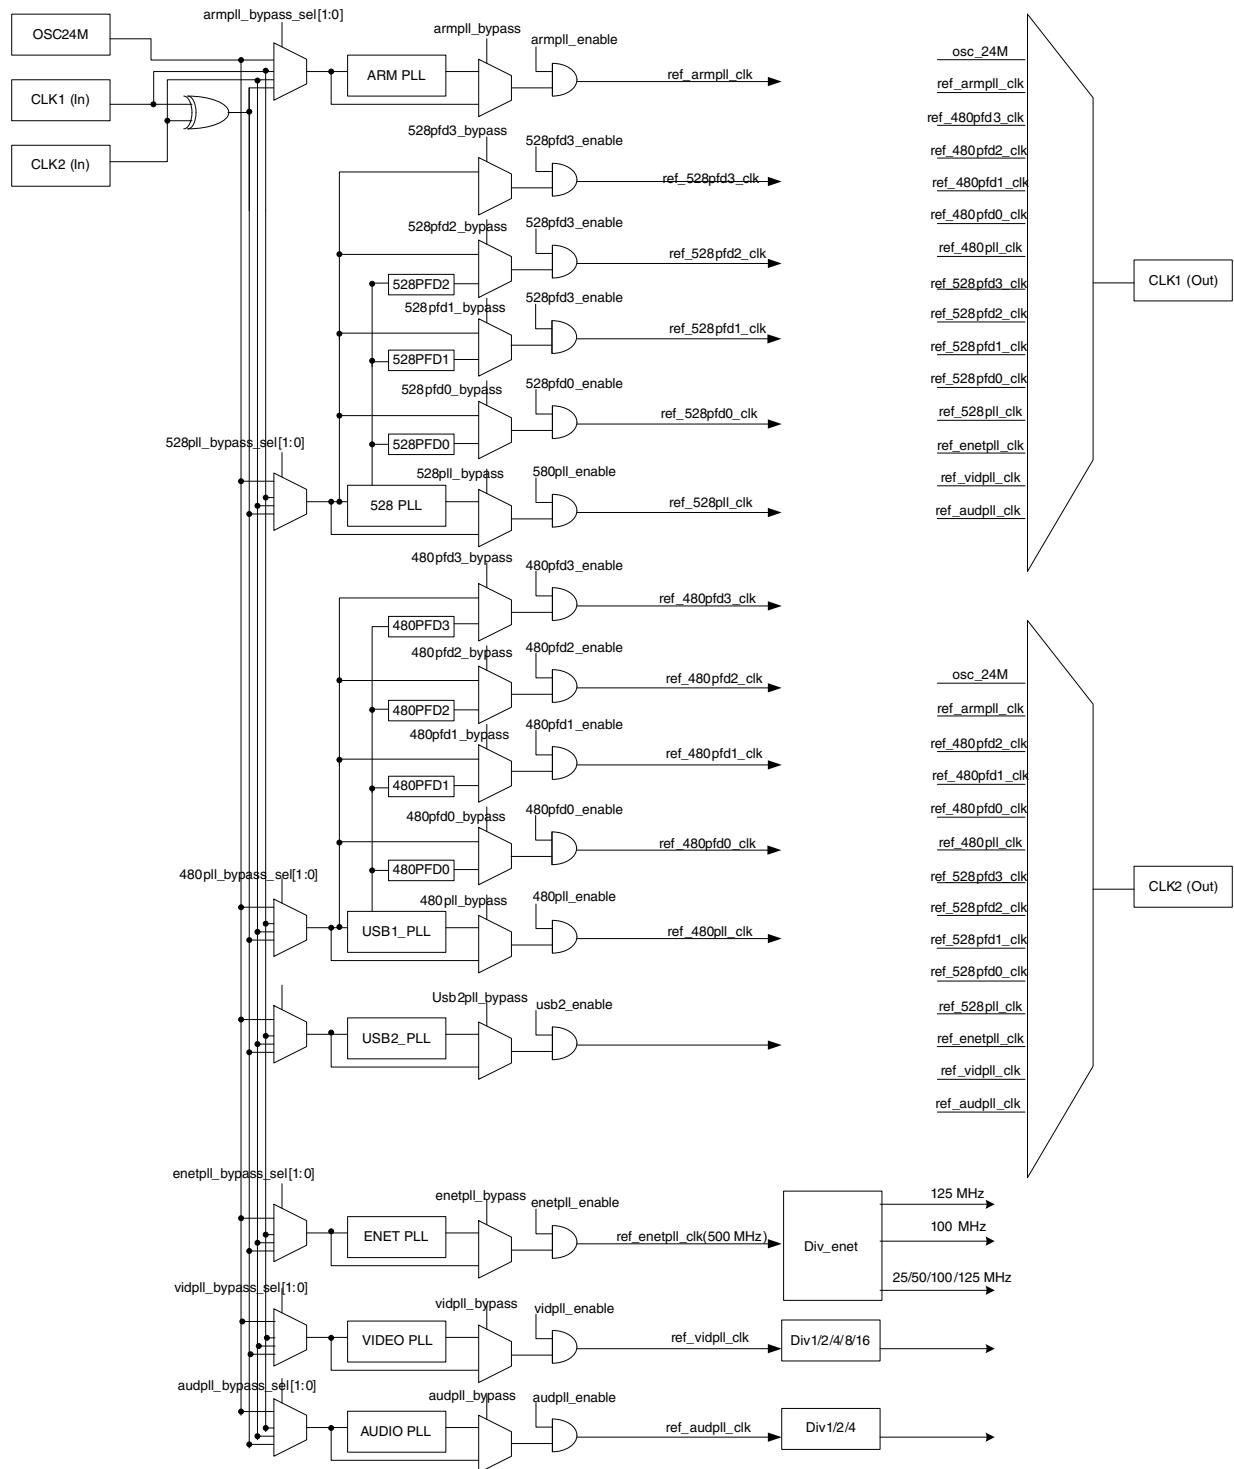

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

## Clock Management

**Figure 10-3. Primary Clock Generation**

### 10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

### 10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

### 10.3.2.2 Low Voltage Differential Signaling (LVDS) I/O ports

There is one LVDS I/O port used for clock generation. The low jitter differential I/O port is provided to input and output clocks. It can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or it can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

### 10.3.2.3 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

#### NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{VCO}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM\_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output

- frequency of up to 1.3 GHz. Note that this frequency is higher than the maximum chip supported frequency 1.0 GHz.
- PLL2 (also referred tp as System\_PLL or 528\_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. Besides the main output, this PLL drives four PFDs (PLL2\_PFD0...PLL2\_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
  - PLL3 (also referred to as USB1\_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3\_PFD0...PLL3\_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
  - PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
  - PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or16 from the PLL VCO frequency
  - PLL6 (also referred to as ENET\_PLL) - This PLL implements a fixed 20+(5/6) multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
    - 50 or 25 MHz for the external ethernet interface.
    - 125 MHz for reduced gigabit ethernet interface.
    - 100 MHz for general purposes.
  - PLL7 (also referred to as USB2\_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as OTG PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.

### 10.3.2.3.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the BYPASS\_CLK\_SRC field of the PLL control register. See [CCM Analog Memory Map/Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at [www.nxp.com](http://www.nxp.com) for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

#### 10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- changing of the DDR memory controller clock. See [MMDC handshake](#) and [Self refresh and Frequency change entry/exit](#) for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

#### NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces, video and display interfaces, or general purpose serial interfaces (e.g. UART, CAN) may cause synchronization loss and should not be done.

#### 10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

## 10.3.3 Peripheral components of clock management system

### 10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory

- clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

### **10.3.3.2 Block level clock management**

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

#### **10.3.3.2.1 Master clock protocol**

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of module supporting master clock protocol USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM\_CMEOR).

### 10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN,EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Overide Register (CCM\_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

### 10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

### 10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

### 10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

## 10.4 Power management

## 10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

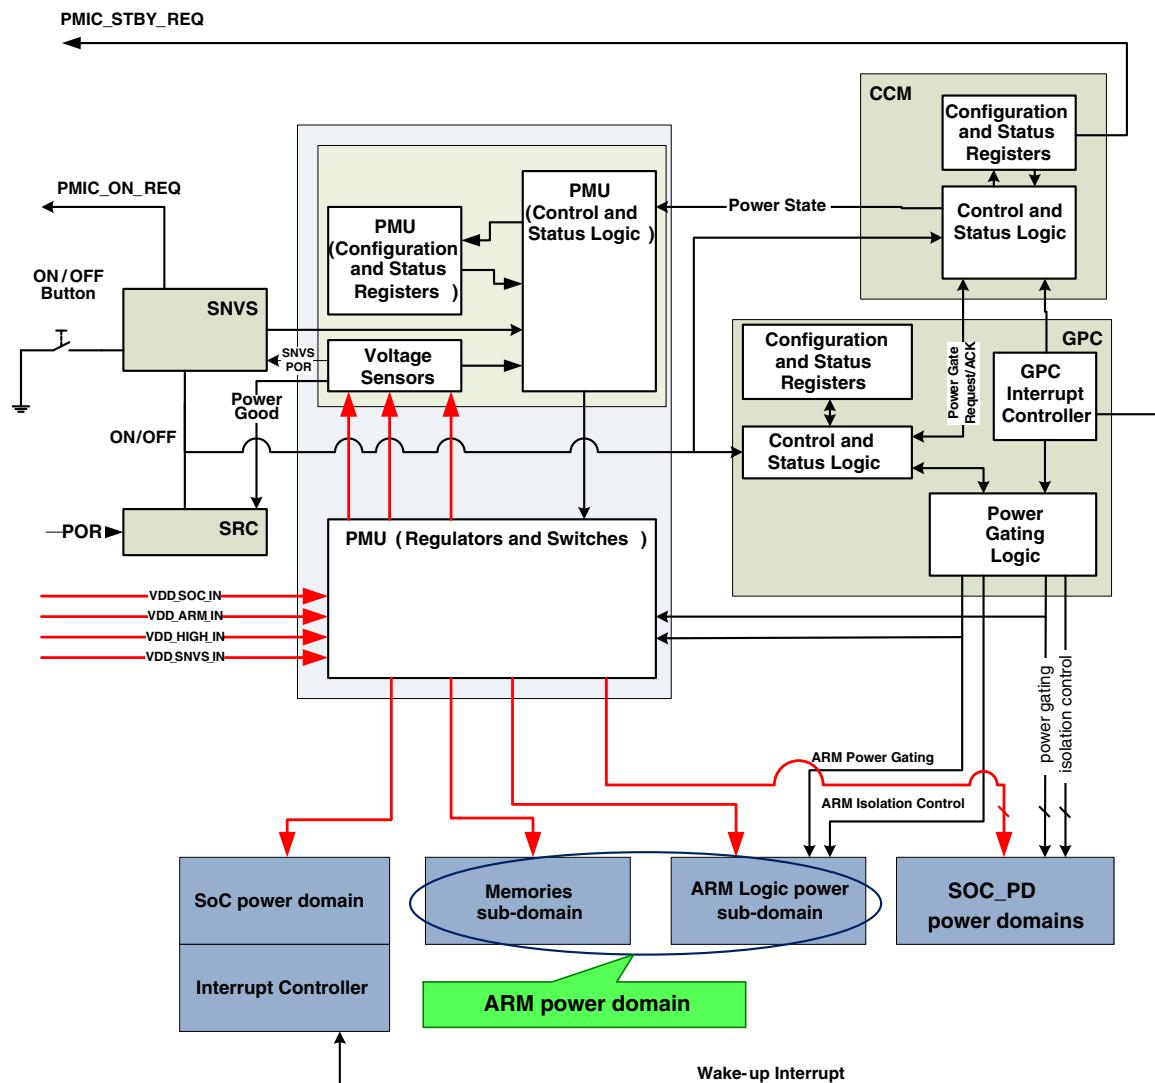

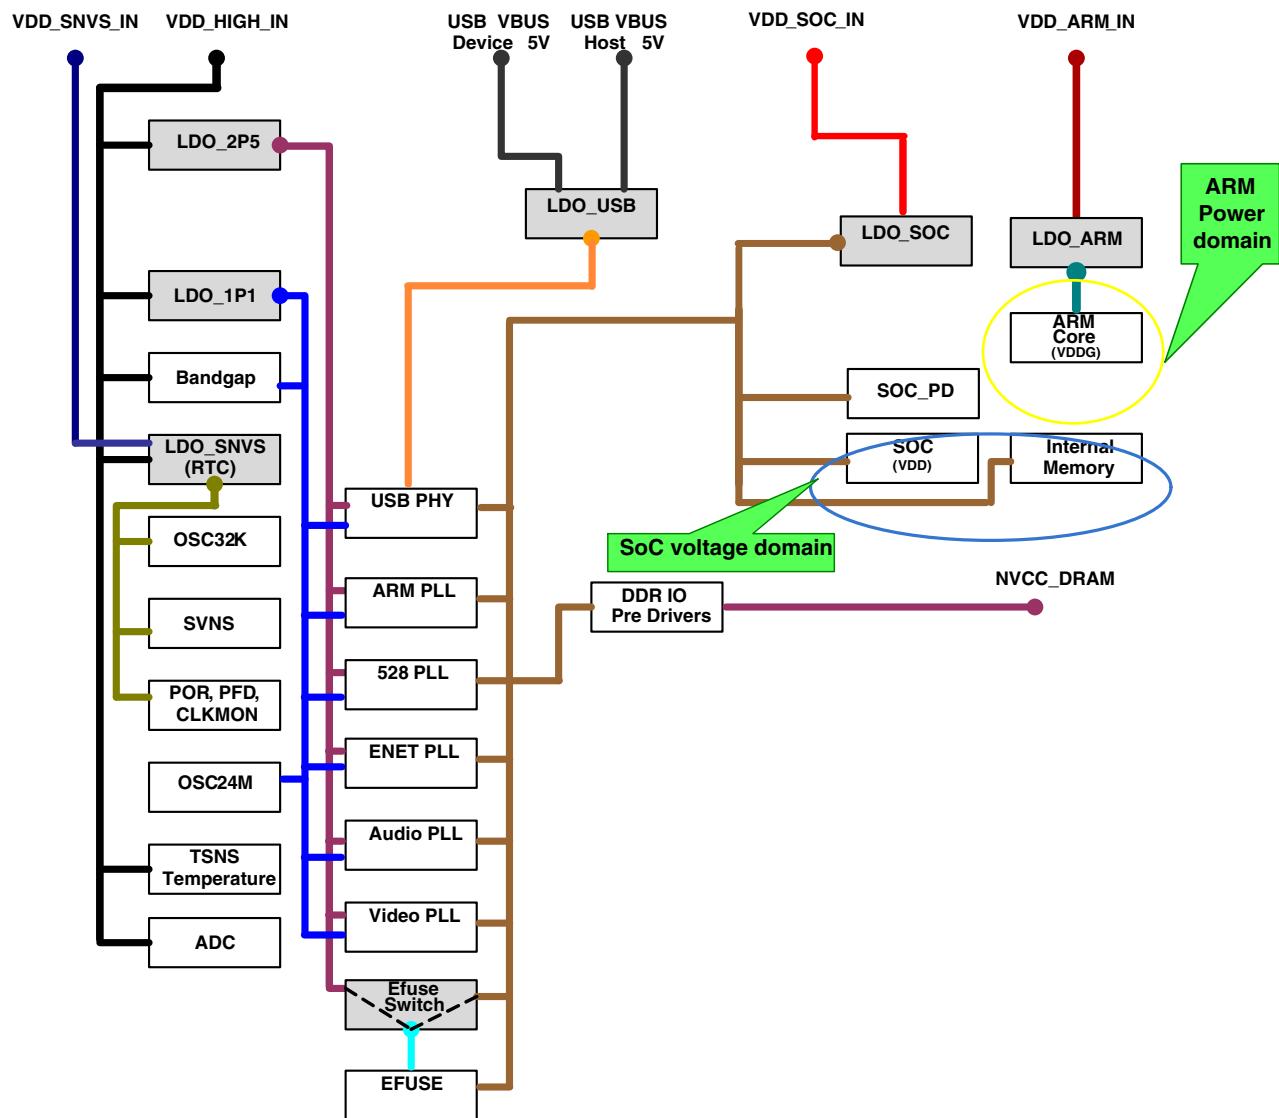

Figure 10-4. Power Management System

### 10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

## Power management

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

**Figure 10-5. i.MX 6ULL Power Tree**

The integrated PMU includes the following components:

- Two Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

### 10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO\_ARM(VDD\_ARM\_IN, VDD\_ARM\_CAP), and LDO\_SOC(VDD\_SOC\_IN, VDD\_SOC\_CAP). LDO\_ARM and LDO\_SOC regulators provide power to the ARM core power domain. LDO\_SOC provides power to the SOC\_PD and SOC power domains(except always-ON SNVS domain).

#### NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- Internal Bypass - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that a period of time (see datasheet) is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to [PMU](#) for further details on bypass and power gate configuration.
- Power Gate - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage of the power FET balances with the leakage of the load.
- Analog regulation mode - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in [Miscellaneous Control Register \(PMU\\_MISC2n\)](#).

For further details of LDO programming and configuration please refer to [Digital Regulator Core Register \(PMU\\_REG\\_COREn\)](#).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In "full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

#### **10.4.1.1.2 Analog LDO regulators**

There are two analog LDO regulators used for general system purposes:

- LDO\_1P1 - The LDO\_1P1 (VDD\_HIGH\_IN, NVCC\_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.
- LDO\_2P5 - The LDO\_2P5 (VDD\_HIGH\_IN, VDD\_HIGH\_CAP) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 40Ohm. Special procedure is recommended to move load back and forth between the main and low power regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, special I/Os (DDR I/O), and other analog and mix signal components integrated into the SoC.

#### **10.4.1.1.3 USB LDO**

The USB\_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

#### 10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH\_IN is present, then the SNVS\_IN supply is internally shorted to the VDDHIGH\_IN supply to allow coin cell recharging if necessary.

#### 10.4.1.2 GPC - General Power Controller

The GPC block includes the sub-blocks listed here.

- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and SOC\_PD power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals.
 

Additional features are as follows:

  - Supports up to 128 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

#### 10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR\_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

## Power management

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

### 10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

The following figure shows the power domain interface within the system.

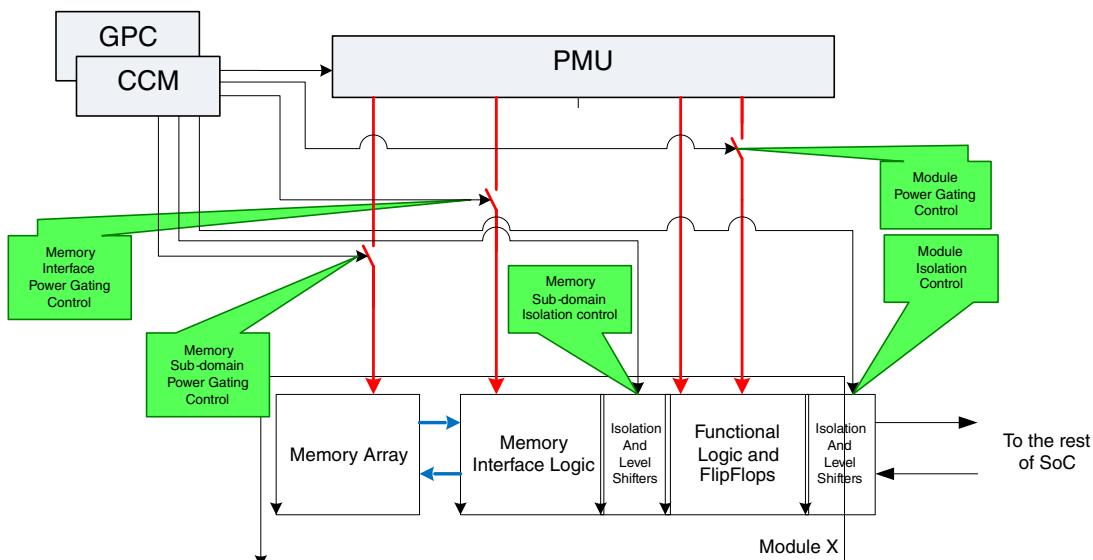

Figure 10-6. Power domain interface

#### 10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- ARM - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated power supply or from an external controllable regulator, preferably high efficiency DCDC converter.
- ARM Memory array - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- SOC\_PD domain -- The SOC\_PD domain contains MMDC, APBHDMA, CSI, ENET, LCDIF, PXP, RawNAND, SDMA, uSDHC and USB. It is supplied by external regulator.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply. SNVS also contains Low Power State Retention (LPSR) GPIO, IOMUX, and LPSR general purpose register.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC. It is supplied by an internal regulator.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A7 Core Platform - DVFS and power gating.
- ARM Cortex-A7 memories - Power gating only.
- SOC\_PD - Power gating only.

See table below for details of the system power domains layout and dependencies.

#### 10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A7 Core Platform is sub-divided into three sub-domains listed below:
- Cortex-A7 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A7 Core Platform TRM.
- Cortex-A7 Core L1 memories - No retention. The L1 memories have a dedicated supply on the package (VDD\_CACHE\_CAP) which should be connected to the Cortex-A7 Core Platform supply. The L1 cache should be flushed prior to power gating in order to allow powering up of the CPU at the same state as before power gating.
- Cortex-A7 Core L2 memories - hardware state-retention since its supplies are driven by the SoC supplies. When Cortex-A7 core is power gated, L2 Cache can be either lefted on with its content retained or power gated together with the core.
- SOC\_PD: This module can be powered gated (together) independently of Cortex-A7 power gating. SOC\_PD is not allowed power down when Cortex-A7 is on. SOC\_PD will be powered on automatically together with Cortex-A7.
- SoC - hardware state-retention in Standby mode.
- SNVS\_LP - hardware state-retention even when SoC supplies are removed.

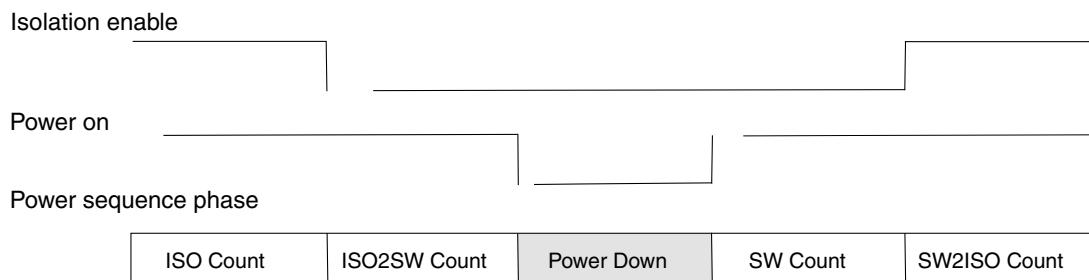

#### 10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

##### 10.4.1.4.3.1 ARM Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
  - Configure the GPC/PGC PGC\_CPU\_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
  - Configure the GPC/PGC PGC\_CPU\_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.

- Configure the GPC PGC PGC\_CPU\_CTRL PCR bit to allow the power down of the platform
- ARM Core Platform should execute a "WFI" instruction.

**Figure 10-7. ARM Core Platform isolation and power on switch flow**

#### 10.4.1.4.3.2 SOC\_PD

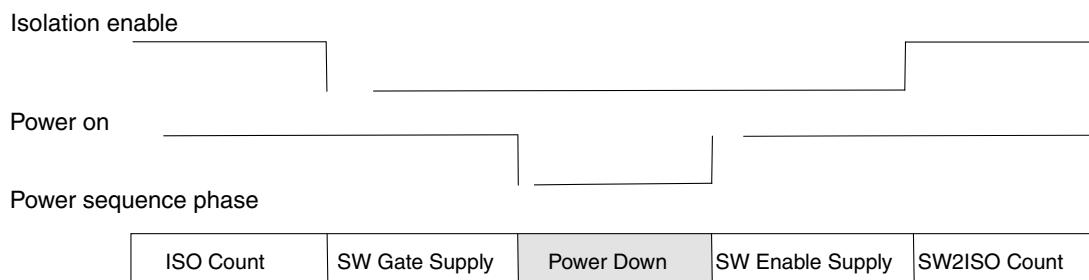

1. Configure the CCM CGR bits ([CCM Memory Map/Register Definition](#)) to disable the SOC\_PD clocks .
2. Configure the GPC/PGC Registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the SOC\_PD logic from the rest of the SoC logic:

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC\_CNTR to power down SOC\_PD

**Figure 10-8. SOC\_PD isolation and power on switch flow**

#### 10.4.1.4.3.3 SoC

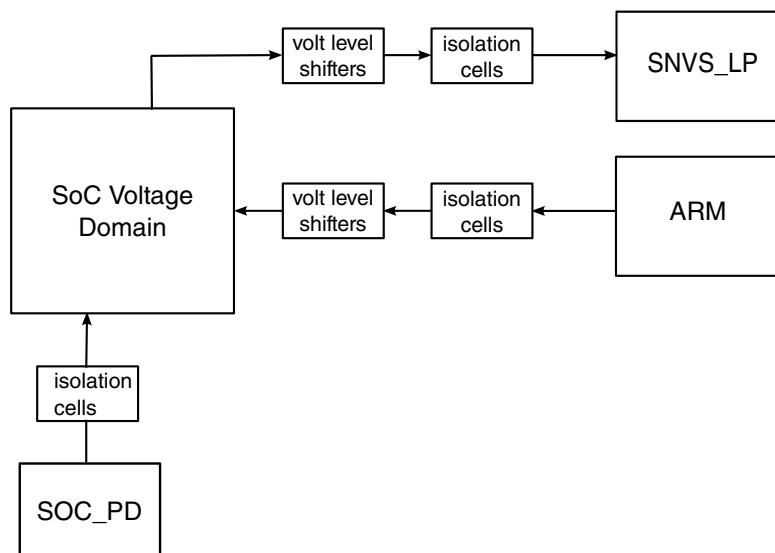

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM\_CCR[COSC\_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS\_LP is powered through an "always on" supply, configuring the SNVS\_LP DP\_EN to "1" allows changing the PMIC\_ON\_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

#### 10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A7 Core Platform and SOC\_PD - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A7 Core Platform executes the "WFI" instruction.
- SNVS\_LP - Different from the 2 cases above, the SNVS\_LP isolation isolates the signals coming from the SoC to the SNVS\_LP. This is required for saving the contents of the SNVS\_LP (such as the real-time clock). The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

**Figure 10-9. Isolation cells and Voltage level shifters placing**

### 10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A7 Core Platform including L1 and L2 cache - Scalable voltage in both dynamic and static scenarios
- SoC Domains - Scalable voltage only in static scenarios
- ANALOG components including PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS\_LP - Fixed voltage

### 10.4.1.6 Voltage domain management

#### 10.4.1.6.1 Dynamic

##### 10.4.1.6.1.1 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and LDOs voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

#### 10.4.1.6.2 Static

##### 10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM\_CCR), CCM Low Power Control Register (CCM\_CLPCR) and PMU Miscellaneous Register 0 (PMU\_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage:

## Power management

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM\_CCR[RBC\_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM\_CCR[REG\_BYP\_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- ARM Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode

### 10.4.1.6.2.2 ANALOG PHYs IPs

Details on how to put the IPs in low power mode can be found in each of the IP documentation. Further reduction can be achieved by settings the ENABLE\_WEAK\_LINREG in the PMU PMU\_REG\_2P5 register.

### 10.4.1.7 System domains layout

The following table describes the different power modes.

**Table 10-1. Low Power Mode Definition (LDO Enabled Mode)**

	System IDLE	Low Power IDLE	SUSPEND
CCM LPM Mode	WAIT	WAIT	STOP
ARM Core	Low Voltage	Power Down	Power Down
L1 Cache	ON	Power Down	Power Down
L2 Cache	ON	ON	Power Down
SOC	Nominal Voltage	Nominal Voltage	Standby Voltage
SOC_PD	ON	ON	ON/Power Down
PLL	ON/Power Down	Power Down	Power Down
XTAL	ON	OFF	OFF
RC OSC	OFF	ON	OFF
DRAM	Self_Refresh <sup>1</sup>	Self-Refresh <sup>2</sup>	Self-Refresh <sup>2</sup>
DRAM IO Low Power	No	Yes	Yes
LDO ARM	ON	Power Gate	Power Gate
LDO SOC	ON	ON	Digital Bypass
LDO2P5	ON	OFF	OFF
LDO1P1	ON	OFF	OFF
WEAK2P5	OFF	ON	OFF
WEAK1P1	OFF	ON	OFF
Bandgap	ON	ON	OFF
Low Power Bandgap	OFF	OFF	OFF
MMDC Clock	24 MHz	OFF	OFF

*Table continues on the next page...*

**Table 10-1. Low Power Mode Definition (LDO Enabled Mode) (continued)**

	<b>System IDLE</b>	<b>Low Power IDLE</b>	<b>SUSPEND</b>
AHB clock	24 MHz	3 MHz	OFF
IPG clock	12 MHz	1.5 MHz	OFF
PER clock	24 MHz	1 MHz	OFF
Module clocks	ON as needed	ON as needed	OFF
GPIO wakeup	yes	Yes	Yes
RTC wakeup	Yes	Yes	Yes
USB remote wakeup	Yes	Yes <sup>3</sup>	Yes <sup>3</sup>
Other wakeup source	Yes	Yes <sup>4</sup>	No

1. Automatic enter self-refresh when there is no DRAM access;
2. Put into self-refresh mode by SW before entering low power mode;
3. Need SOC\_PD power on to support USB remote wakeup;
4. When a module is inside SOC\_PD domain, need SOC\_PD power on to support wakeup from it.

**Table 10-2. Low Power Mode Definition (LDO Bypass Mode)**

	<b>System IDLE</b>	<b>Low Power IDLE</b>	<b>SUSPEND</b>
CCM LPM Mode	WAIT	WAIT	STOP
ARM Core	Low Voltage	Power Down	Power Down
L1 Cache	Low Voltage	Power Down	Power Down
L2 Cache	ON	ON	Power Down
SOC	Nominal Voltage	Nominal Voltage	Standby Voltage
SOC_PD	ON	ON	ON/Power Down
PLL	ON/Power Down	Power Down	Power Down
XTAL	ON	OFF	OFF
RC OSC	OFF	ON	OFF
DRAM	Self_Refresh <sup>1</sup>	Self-Refresh <sup>2</sup>	Self-Refresh <sup>2</sup>
DRAM IO Low Power	No	Yes	Yes
LDO ARM	Digital Bypass	Power Gate	Power Gate
LDO SOC	Digital Bypass	Digital Bypass	Digital Bypass
LDO2P5	ON	OFF	OFF
LDO1P1	ON	OFF	OFF
WEAK2P5	OFF	ON	OFF
WEAK1P1	OFF	ON	OFF
Bandgap	ON	OFF	OFF
Low Power Bandgap	OFF	ON	OFF
MMDC Clock	24 MHz	OFF	OFF
AHB clock	24 MHz	3 MHz	OFF
IPG clock	12 MHz	1.5 MHz	OFF
PER clock	24 MHz	1 MHz	OFF
Module clocks	ON as needed	ON as needed	OFF
GPIO wakeup	Yes	Yes	Yes

Table continues on the next page...

**Table 10-2. Low Power Mode Definition (LDO Bypass Mode) (continued)**

	System IDLE	Low Power IDLE	SUSPEND
RTC wakeup	Yes	Yes	Yes
USB remote wakeup	Yes	Yes <sup>3</sup>	Yes <sup>3</sup>
Other wakeup source	Yes	Yes <sup>4</sup>	No

1. Automatic enter self-refresh when there is no DRAM access;
2. Put into self-refresh mode by SW before entering low power mode;
3. Need SOC\_PD power on to support USB remote wakeup;
4. When a module is inside SOC\_PD domain, need SOC\_PD power on to support wakeup from it.

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the [PMU\\_MISC0\[STOP\\_MODE\\_CONFIG\]](#) bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop\_mode signal. Blocks not described in the section below are unaffected by stop\_mode.

If the stop\_mode\_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop\_mode\_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

**Table 10-3. STOP mode configuration**

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
reg_core	bypassed if not power gated.	bypassed if not power gated
reg_soc	bypassed	bypassed
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration

## 10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains

- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM core) for preserving memory contents and device state in low-power modes
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

#### 10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

**Table 10-4. Power saving design/architecture and power saving techniques**

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	✓		
ARM Core Platform SRPG (Software)		✓	
ARM Core Platform Power Gating		✓	
Clock gating (automatic dynamic and forced)	✓		
Integrated PMU (IR drop, efficiency, accuracy)	✓		✓
C4 package (IR drop, thermal)	✓		
Display Backlight optimization (SW)			✓
Architecture: L2 cache	✓		
Architecture: USB integration			✓
Low Power DDR: LPDDR2, LV-DDR3			✓

### 10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

### 10.4.2.3 Peripheral Power management

#### 10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See [Power Saving and Clock Frequency Change modes](#) for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

#### NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency below 396 MHz may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

### **10.4.2.3.2 Video-Graphics system power management**

### **10.4.2.3.3 IO power reduction**

Software configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs

- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible

### **10.4.3 Examples of External Power Supply Interface**

This section presents the example of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented in the following figure. This scenario minimizes BoM and board design complexity.

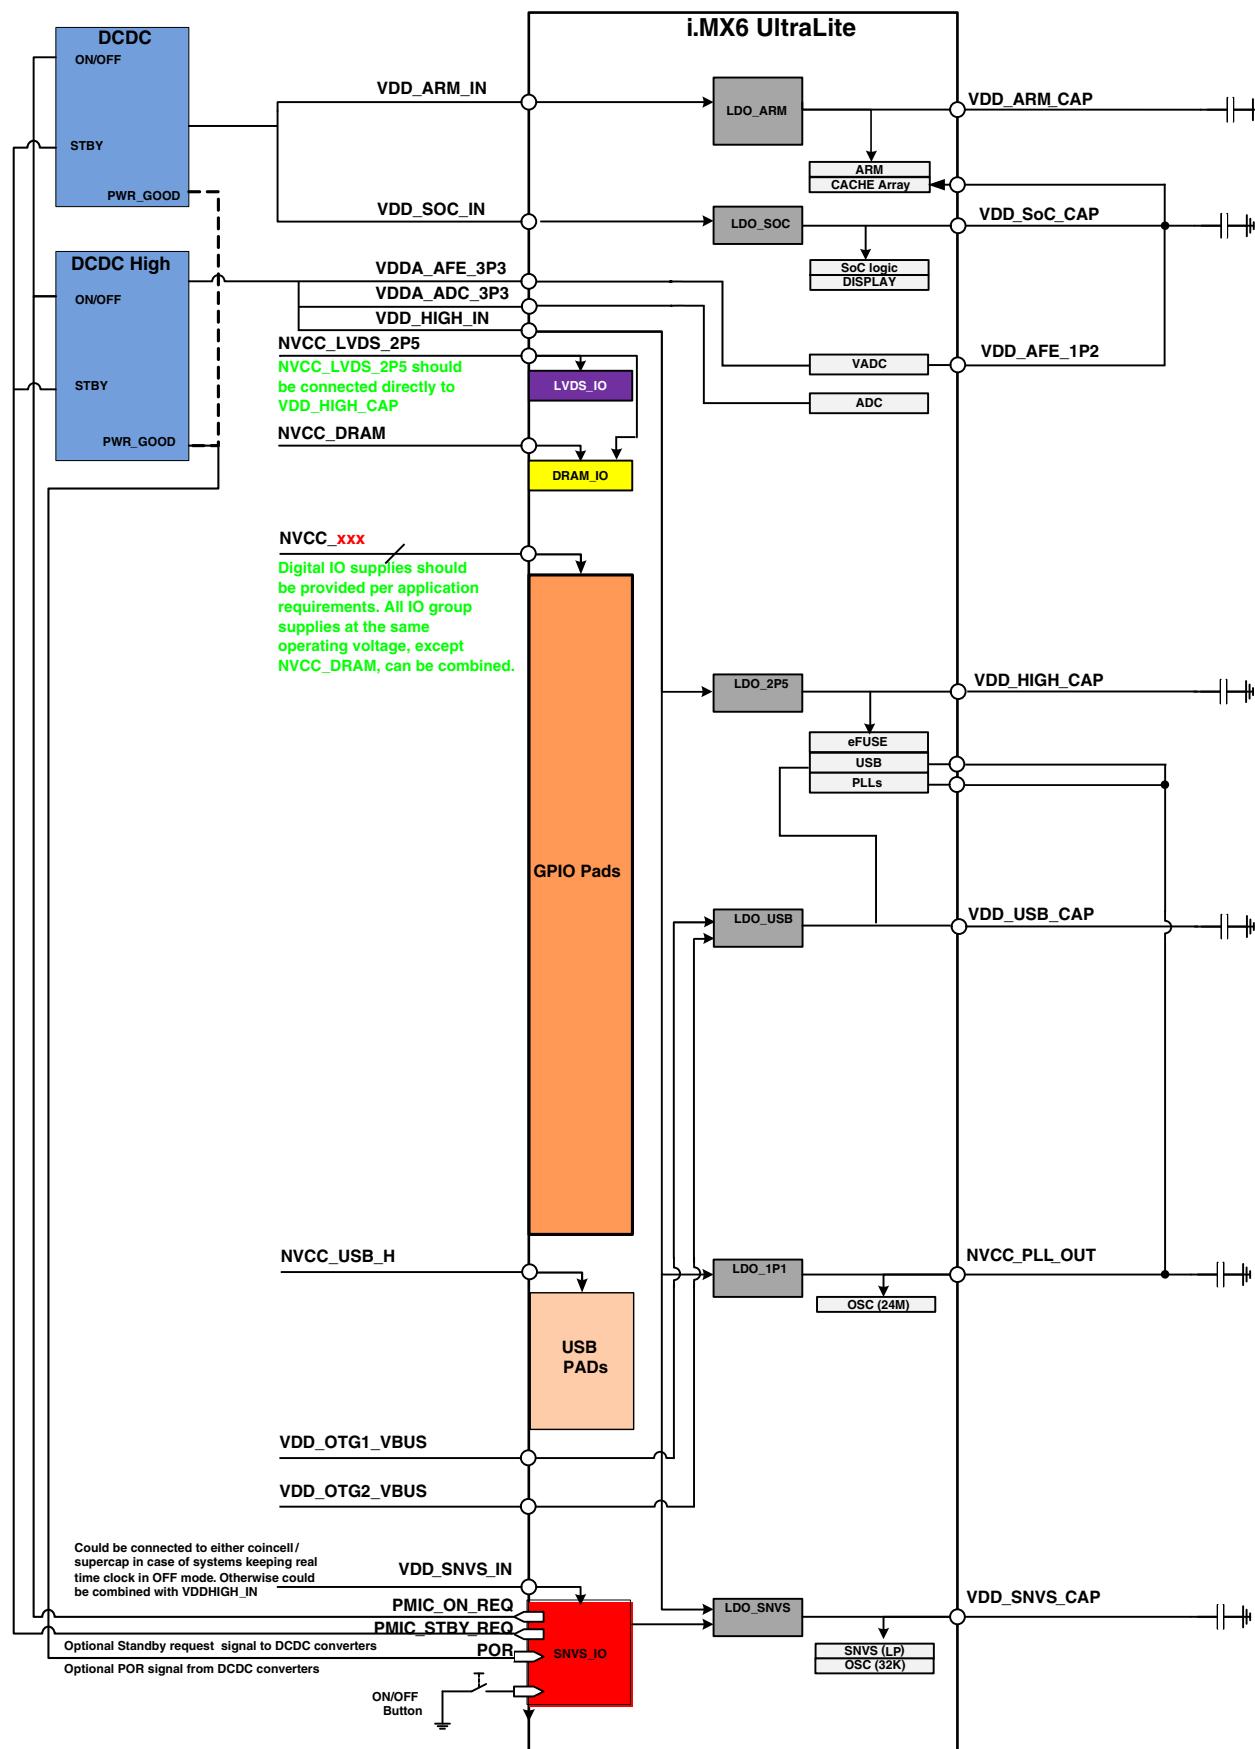

Figure 10-10 Supplying i.MX 6ULL power using integrated PMU  
i.MX 6ULL Applications Processor Reference Manual, Rev. 1, 11/2017

## 10.5 ONOFF (Button)

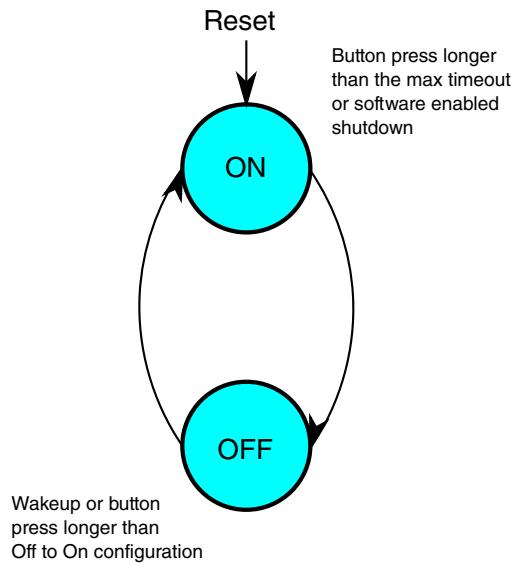

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The ONOFF logic inside of SNVS\_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a pmic\_en\_b and set\_pwr\_off\_irq signal. PMIC logic also supports the SNVS\_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

The Dumb PMIC Mode uses pmic\_en\_b to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- Debounce: The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the set\_pwr\_off\_irq interrupt. While in the ON state and the button is pressed longer than the debounce time the set\_pwr\_off\_irq is generated.
- Off to On Time: The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. Once the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- Max Timeout: The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The Dumb PMIC mode uses a 2 state state machine, as shown below. The output of the pmic\_en\_b is generated by the state of the state machine.

**Figure 10-11. Dumb PMIC Mode State Machine**

The Smart PMIC mode is meant to connect to another PMIC. The pmic\_en\_b signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the set\_pwr\_off\_irq.

# Chapter 11

## System Security

### 11.1 Overview

Security is a common requirement for platforms built using the chip, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

For the platform designer to meet the requirements for each market, the chip incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the chip security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the chip includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the chip security components.

- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A7 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)
- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)
- Secure JTAG Controller (SJC)

## Central Security Unit (CSU)

- Locked mode in the Smart Direct Memory Access (SDMA) controller
- 2 tamper pins supported
- Hardware Cryptographic Accelerators
  - Symmetric: AES-128
  - Hash Message Digest: SHA-1 and SHA-256
- True and Pseudo Random Number Generator

## 11.2 Central Security Unit (CSU)

### 11.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

### 11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

### 11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

### 11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- csu\_sec\_level for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the csu\_sec\_level signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual.

**Table 11-1. Permission Access Table**

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

## 11.3 Secure Non-Volatile Storage (SNVS)

### 11.3.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS sends an interrupt to alert the Operating System of the event. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Tamper detection circuits that detect JTAG events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt
- Controls the access to the OTP master secret key used by DCP to protect confidential data in off-chip storage
- Smart button input in the SNVS\_LP logic of the SoC.
- Pulse mode output signal to request power state changes to a ‘Smart’ external PMIC.

### 11.3.2 Tamper Detection

External Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering. Inside the chip, the received signal is compared with the desired signal level, once unequal, tamper event is found. When the desired signal is fixed, it is a passive tamper; when the desired signal level is also toggling with time, it is an active tamper. The chip supports at most 10 passive tamper detection pins, or 5 active tamper pairs alternatively. The use of each active tamper pair will reduce the available number of passive tamper pins at most by 2.

An always-ON power supply (coincell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

### 11.4 Data Co-Processor (DCP)

For security purposes, the Data Co-Processor (DCP) provides hardware acceleration for the cryptographic algorithms. The features of DCP are:

- Encryption Algorithms: AES-128 (ECB and CBC modes)
- Hashing Algorithms: SHA-1 and SHA-256
- Key selection from the SNVS, DCP internal key storage, or general memory
- Internal Memory for storing up to four AES-128 keys—when a key is written to a key slot it can be read only by the DCP AES-128 engine
- IP slave interface
- DMA

### 11.5 High-Assurance Boot (HAB)

The HAB, which is the high-assurance boot feature in the system boot ROM, detects and prevents the execution of unauthorized software (malware) during the boot sequence.

When the unauthorized software is permitted to gain control of the boot sequence, it can be used for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks, or for repurposing the platform. The unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from the USB connections or removable devices.

The HAB protects against unauthorized software by:

- Using digital signatures to recognize the authentic software. This enables you to boot the device to a known initial state and run the software signed by the device manufacturer.

## 11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the Arm processor and the system bus. This enables program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. The System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to the IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary-scan) testing.

The SJC provides these security levels:

- The JTAG Disabled-JTAG use is permanently blocked.
- The No-Debug-All security sensitive JTAG features are permanently blocked.
- The Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- The JTAG Enabled-JTAG use is unrestricted.

The security levels are selected via the e-fuse configuration.

# **Chapter 12**

## **ARM Cortex A7 Platform (CA7)**

### **12.1 Overview**

The Cortex-A7 MPCore platform is a high-performance, low-power processor compliant with the ARMv7-A architecture. The Cortex-A7 MPCore platform has a single Arm®Cortex®-A7 core with a L1 cache subsystem and integrated Generic Interrupt Controller (GIC).

Each Cortex-A7 MPCore includes the following:

- 32 KB L1 Instruction Cache
- 32 KB L1 Data Cache
- Media Processing Engine (MPE) with NEON technology supporting the Advanced Single Instruction Multiple Data version 2 (SIMDv2) architecture
- Floating Point Unit (FPU) with support of the VFPv4-D32 architecture

#### **NOTE**

This is a superset of VFPv4-D16

- Support of ARMv7A architecture including:
  - Security extensions for enhanced security
  - Virtualization extensions
  - Large Physical Address (LPA) extension (LPA only supported within Cortex-A7 MPCore platform)

The Cortex-A7 MPCore platform includes the following:

- Integrated Global Interrupt Controller (GIC) configured to support 128 shared peripheral interrupts
- Generic timer
- Snoop control unit (SCU)
- 128 KB unified L2 cache
- Interconnect using a single 128-bit wide bus AMBA AXI bus
- ARMv7.1 Arm debug architecture that complies with the Coresight debug/trace architecture

## 12.2 External Signals

The following table describes the external signals of Arm:

## 12.3 Clocks

This section will discuss the Cortex-A7 clocks. For the specification of the maximum Cortex-A7 core frequency, please see the product datasheet. The following table describes the clock sources for Arm. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 12-1. Arm Clocks**

Clock name	Clock Root	Description
clk_ahb	ahb_clk_root	AHB Clock
clk_apb_dbg	ahb_clk_root	APB Debug Clock
clk_atb	ahb_clk_root	ATB Clock
ipg_clk	ipg_clk_root	Peripheral Clock
trace_clk_in	ahb_clk_root	Trace Clock

**Bus Clocks:** The AXI master port of the Cortex-A7 MPCore platform is designed to run at half the speed (1:2 ratio) of the Cortex-A7 core.

**Debug Clocks:** The APB debug interface is designed to run at half the speed (1:2 ratio) of the Cortex-A7 core.

## 12.4 Platform Configuration

The revision and configuration of components the Cortex-A7 MPCore platform are detailed below.

**Table 12-2. Component Revision**

Component	Revision
Cortex-A7 MPCore	MP020-BU-50000-r0p5-00rel0 MP020-BU-50000-r0p5-50rel0
ETM-A7	TM956-BU-50000-r0p0-00rel0

**Table 12-3. Cortex-A7 MPCore Global Configuration**

Option	Selected Value	Comments
Instruction cache size	32 KB	L1 instruction cache size per core
Data cache size	32 KB	L1 data cache size per core
L2 cache controller	Present	Integrated L2 cache controller
L2 data RAM cycle latency	2 cycles	
Shared Peripheral Interrupts	128	128 shared peripheral interrupts
Number of processors	1	Single Cortex-A7 MPCore
Integrated GIC	True	GIC included

**Table 12-4. Cortex-A7 Core-Level Configuration**

Option	Selected Value	Comments
NEON and/or FPU	FPU and NEON	FPU and NEON are both included in each processor

## 12.5 Low-Power and Performance

This section will discuss the low-power and performance features of the Cortex-A7 Core Platform.

The Cortex-A7 MPCore includes the following low-power features:

- Power-efficient processing provided by Cortex-A7 CPU
- 40nm LL process technology
- Flexible power domain partitioning with separate domains for the following blocks:
  - CPU and respective L1 caches
  - SCU and L2 cache controller
  - L2 cache memory
  - Debug including ETM
- Power-efficient timer events using combination of local generic timers and the global system counter
- DVFS to support overdrive and non-overdrive modes of operation

# Chapter 13

## Analog-to-Digital Converter (ADC)

### 13.1 Overview

The analog-to-digital converter (ADC) is a successive approximation ADC designed for operation within an integrated microcontroller system-on-chip.

#### 13.1.1 Features

The features of the ADC are as follows:

- Configuration registers
  - 32-bit, word aligned, byte enabled registers. (byte and halfword access is not supported)
- Linear successive approximation algorithm with up to 12-bit resolution with 10/11 bit accuracy.
- Up to 10 ENOB (dedicated single ended channels)
- Up to 1MS/s sampling rate
- Up to 8 single-ended external analog inputs
- Single or continuous conversion (automatic return to idle after single conversion)
- Output Modes: (in right-justified unsigned format)
  - 12-bit
  - 10-bit
  - 8-bit
- Configurable sample time and conversion speed/power
- Conversion complete and hardware average complete flag and interrupt
- Input clock selectable from up to three sources
- Asynchronous clock source for lower noise operation with option to output the clock
- Automatic compare with interrupt for less-than, greater-than or equal-to, within range, or out-of-range, programmable value
- Operation in low power modes for lower noise operation

- Hardware average function
- Self-calibration mode

### 13.1.2 ADC I/F block diagram

The following diagram represents the ADC I/F block.

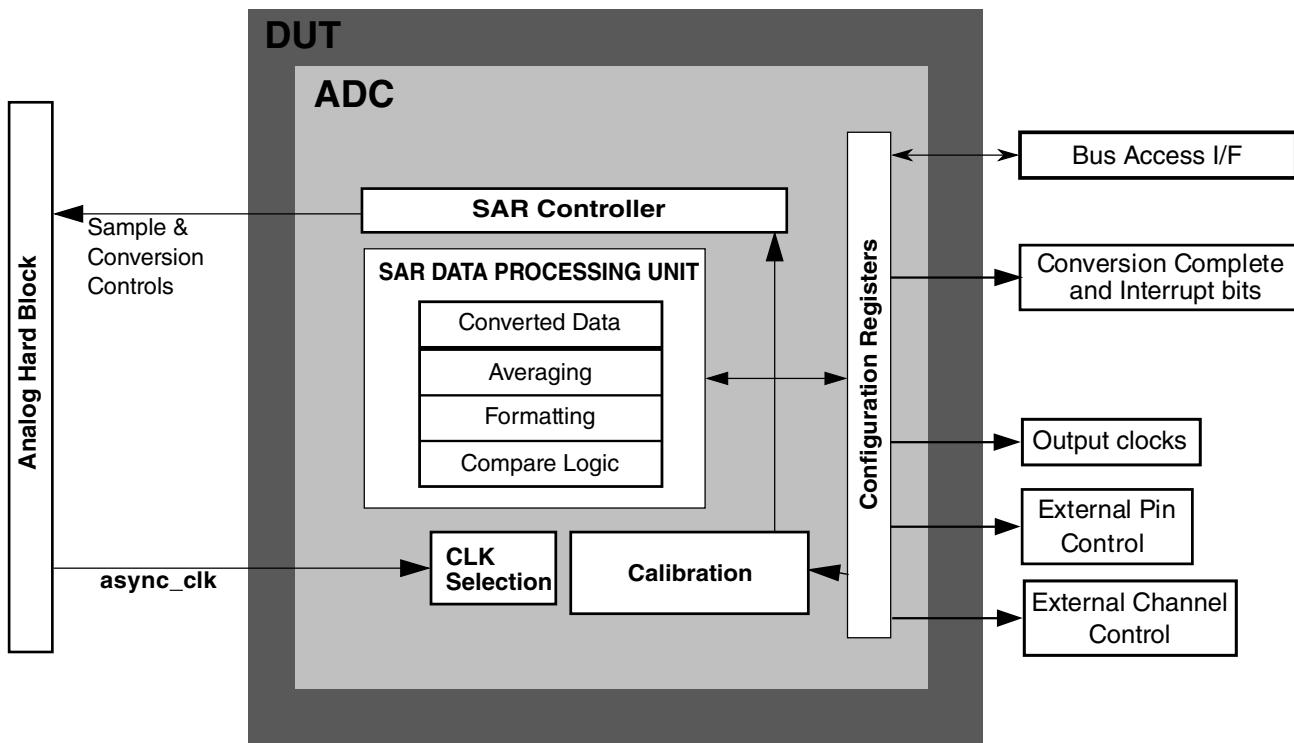

Figure 13-1. ADC I/F block diagram

### 13.1.3 ADC block diagram

The following figure shows a top-level block diagram of the ADC module.

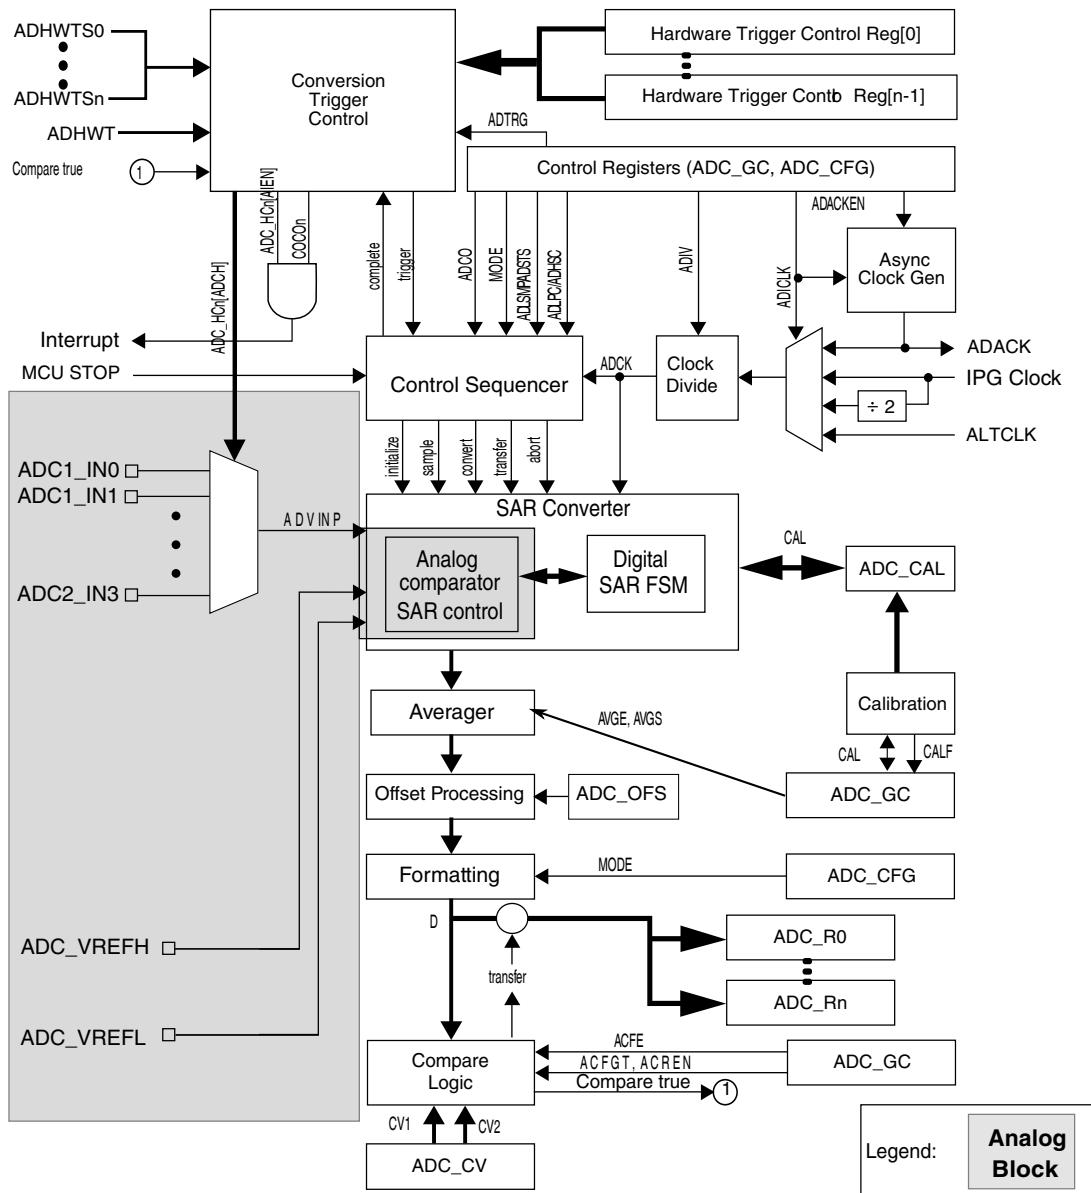

Figure 13-2. ADC block diagram

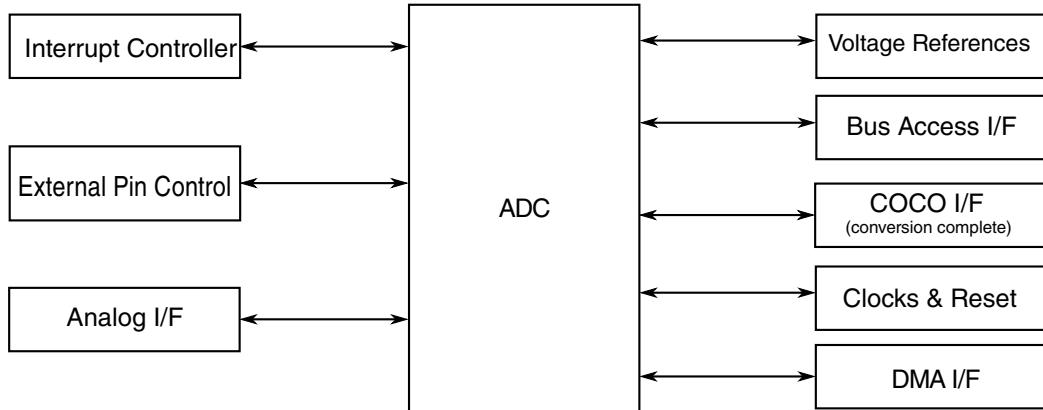

**NOTE**

ADC\_VREFL is shorted to ground internally, no dedicate ball for this signal.

### 13.1.4 ADC module interface

The ADC is connected to many interfaces such as the clocks and reset, access bus, voltage references, interrupt controller, ADC pin control, and analog I/F as shown in the following figure.

## External Signals

**Figure 13-3. ADC module interface**

### 13.1.5 Modes of Operation

By default, the ADC is in disabled mode. In this state, no conversion or other actions occur. All of the ADC control registers are accessible in this state through an access bus interface. To enable the ADC, required configurations should be done by programming the ADC configuration registers.

## 13.2 External Signals

The following table describes the external signals of ADC:

**Table 13-1. ADC External Signals**

Signal	Description	Pad	Mode	Direction
ADC_VREFH	Voltage reference high	ADC_VREFH	-	I
ADC1_IN0	Analog channel 1 input 0	GPIO1_IO00	-	I
ADC1_IN1	Analog channel 1 input 1	GPIO1_IO01	-	I
ADC1_IN2	Analog channel 1 input 2	GPIO1_IO02	-	I
ADC1_IN3	Analog channel 1 input 3	GPIO1_IO03	-	I
ADC1_IN4	Analog channel 1 input 4	GPIO1_IO04	-	I
ADC1_IN5	Analog channel 1 input 5	GPIO1_IO05	-	I
ADC1_IN6	Analog channel 1 input 6	GPIO1_IO06	-	I
ADC1_IN7	Analog channel 1 input 7	GPIO1_IO07	-	I
ADC1_IN8	Analog channel 1 input 8	GPIO1_IO08	-	I
ADC1_IN9	Analog channel 1 input 9	GPIO1_IO09	-	I
ADC2_IN0	Analog channel 2 input 0	GPIO1_IO00	-	I
ADC2_IN1	Analog channel 2 input 1	GPIO1_IO01	-	I
ADC2_IN2	Analog channel 2 input 2	GPIO1_IO02	-	I

*Table continues on the next page...*

**Table 13-1. ADC External Signals (continued)**

Signal	Description	Pad	Mode	Direction
ADC2_IN3	Analog channel 2 input 3	GPIO1_IO03	-	I
ADC2_IN4	Analog channel 2 input 4	GPIO1_IO04	-	I
ADC2_IN5	Analog channel 2 input 5	GPIO1_IO05	-	I
ADC2_IN6	Analog channel 2 input 6	GPIO1_IO06	-	I
ADC2_IN7	Analog channel 2 input 7	GPIO1_IO07	-	I
ADC2_IN8	Analog channel 2 input 8	GPIO1_IO08	-	I
ADC2_IN9	Analog channel 2 input 9	GPIO1_IO09	-	I

Signal	Description	Pad	Mode	Direction
ADC 1_IN0	Analog channel 1 input 0	GPIO_AD_B1_11	-	I
ADC1_IN1	Analog channel 1 input 1	GPIO_AD_B0_12	-	I
ADC1_IN2	Analog channel 1 input 2	GPIO_AD_B0_13	-	I
ADC1_IN3	Analog channel 1 input 3	GPIO_AD_B0_14	-	I
ADC1_IN4	Analog channel 1 input 4	GPIO_AD_B0_15	-	I
ADC1_IN5	Analog channel 1 input 5	GPIO_AD_B1_00	-	I
ADC1_IN6	Analog channel 1 input 6	GPIO_AD_B1_01	-	I
ADC1_IN7	Analog channel 1 input 7	GPIO_AD_B1_02	-	I
ADC1_IN8	Analog channel 1 input 8	GPIO_AD_B1_03	-	I
ADC1_IN9	Analog channel 1 input 9	GPIO_AD_B1_04	-	I
ADC1_IN10	Analog channel 1 input 10	GPIO_AD_B1_05	-	I
ADC1_IN11	Analog channel 1 input 11	GPIO_AD_B1_06	-	I
ADC1_IN12	Analog channel 1 input 12	GPIO_AD_B1_07	-	I
ADC1_IN13	Analog channel 1 input 13	GPIO_AD_B1_08	-	I
ADC1_IN14	Analog channel 1 input 14	GPIO_AD_B1_09	-	I
ADC1_IN15	Analog channel 1 input 15	GPIO_AD_B1_10	-	I
ADC 2_IN0	Analog channel 2 input 0	GPIO_AD_B1_11	-	I

Table continues on the next page...

## Functional Description

ADC2_IN1	Analog channel 2 input 1	GPIO_AD_B1_12	-	I
ADC2_IN2	Analog channel 2 input 2	GPIO_AD_B1_13	-	I
ADC2_IN3	Analog channel 2 input 3	GPIO_AD_B1_14	-	I
ADC2_IN4	Analog channel 2 input 4	GPIO_AD_B1_15	-	I
ADC2_IN5	Analog channel 2 input 5	GPIO_AD_B1_00	-	I
ADC2_IN6	Analog channel 2 input 6	GPIO_AD_B1_01	-	I
ADC2_IN7	Analog channel 2 input 7	GPIO_AD_B1_02	-	I
ADC2_IN8	Analog channel 2 input 8	GPIO_AD_B1_03	-	I
ADC2_IN9	Analog channel 2 input 9	GPIO_AD_B1_04	-	I
ADC2_IN10	Analog channel 2 input 10	GPIO_AD_B1_05	-	I
ADC2_IN11	Analog channel 2 input 11	GPIO_AD_B1_06	-	I
ADC2_IN12	Analog channel 2 input 12	GPIO_AD_B1_07	-	I
ADC2_IN13	Analog channel 2 input 13	GPIO_AD_B1_08	-	I
ADC2_IN14	Analog channel 2 input 14	GPIO_AD_B1_09	-	I
ADC2_IN15	Analog channel 2 input 15	GPIO_AD_B1_10	-	I

### NOTE

The ADC input signals connect to GPIO[0:9]. The GPIO default configuration is enabled for keeper. The keeper causes an undesired jump behavior in ADC. To avoid the problem, disable keeper before starting ADC. For detailed information about keeper, refer to the GPIO block.

## 13.3 Functional Description

There are three possible states which ADC module can be in:

1. Disabled State
2. Idle state

### 3. Performing conversions

#### **Disabled State:**

The ADC module is disabled during reset or stop mode (if internal clock is not selected as source of clock).

#### **Idle State:**

The module is idle when a conversion has completed and another conversion has not been initiated. When idle and the asynchronous clock output enable is disabled ( $\text{ADACKEN} = 0$ ), the module is in its lowest power state.

#### **Conversion State:**

The ADC can perform an analog-to-digital conversion on any of the software selectable channels. All modes perform conversion by a successive approximation algorithm.

To meet accuracy specifications the ADC module must be calibrated using the on chip calibration function. Calibration is recommended to be done after any reset.

When the conversion is completed, the result is placed in the data result registers ( $\text{ADC\_R}_n$ ). The conversion complete flag ( $\text{COCOn}$ ) field in the Hardware Status register is/are then set and an interrupt is generated, if the respective conversion complete interrupt has been enabled ( $\text{ADC\_HC}_n[\text{AIEN}] = 1$ ).

The ADC module has the capability of automatically comparing the result of a conversion with the contents of the compare value registers. The compare function is enabled by setting ACFE (ADC Compare Function Enable) in the ADC general control register.

The ADC module has the capability of automatically averaging the result of multiple conversions. The hardware average function is enabled by setting AVGE in the ADC general control register.

#### **13.3.1 Clock Select and Divide Control**

The ADC digital module has two clock sources:

- IPG clock
- Internal clock (ADACK) is a dedicated clock used only by the ADC.

ADC digital block generates IPG clock/2 by internally dividing the IPG clock. The final clock is chosen from the following clocks.

- IPG clock
- IPG clock divided by 2
- ADACK

From the three clocks listed above, one is chosen depending on the configuration of ADICLK[1:0] bits of ADC\_CFG. This chosen clock is divided depending on the configuration of ADIV[1:0] bits of ADC\_CFG. The final generated clock is used as conversion clock for ADC.

ADICLK	Selected Clock Source
00	IPG clock
01	IPG clock divided by 2
10	Reserved
11	Asynchronous clock (ADACK)

- The IPG clock. This is the default selection following reset.
- The IPG clock divided by two. For higher IPG clock rates, this allows a maximum divide by 16 of the IPG clock using the ADIV bits.
- The asynchronous clock (ADACK). This clock is generated from a clock source within the ADC module. Conversions are possible using ADACK as the input clock source while the MCU is in stop mode.

Whichever clock is selected, its frequency must fall within the specified frequency range for ADCK. If the available clocks are too slow, the ADC may not perform according to specifications. If the available clocks are too fast, the clock must be divided to the appropriate frequency. This divider is specified by the ADIV bits and can be divide-by 1, 2, 4, or 8.

### 13.3.2 Voltage Reference Selection

The ADC can be configured to use reference pairs as the reference voltages used for conversions ( $V_{REFSH}$  and  $V_{REFSL}$ ). Each pair contains a positive reference which must be between the minimum Ref Voltage High and  $V_{DDAD}$ , and a ground reference which must be at the same potential as  $V_{SSAD}$ . The pairs can be as follows:

- External ( $V_{REFH}$  and  $V_{REFL}$ )

These voltage references are selected by configuring ADC\_CFG[REFSEL].

### 13.3.3 Conversion Control

Conversions are performed as determined by ADC\_CFG[MODE] field.

Conversions are initiated by a software trigger. In addition, the ADC can be configured for low power operation, long sample time, continuous conversion, hardware average, and automatic comparison of conversion results with predetermined values.

#### 13.3.3.1 Initiating Conversions

A conversion is initiated:

- Following a write to ADC\_HC0 when a software triggered operation is selected (ADTRG=0).
- Following the transfer of the result to the data registers when continuous conversion is enabled (ADCO=1 in ADC\_GC register).

If continuous conversion is enabled, a new conversion is automatically initiated after the completion of the current conversion. In software triggered operation (ADTRG=0), continuous conversions begin after ADC\_HC0 is written and continue until aborted.

If hardware averaging is enabled, a new conversion is automatically initiated after the completion of the current conversion until the correct number of conversions is completed. In software triggered operation, conversions begin after ADC\_HC0 is written. If continuous conversions is also enabled, a new set of conversions to be averaged are initiated following the last of the selected number of conversions.

#### 13.3.3.2 Completing Conversions

A conversion is completed when the result of the conversion is transferred into the data result registers. (provided the compare function & hardware averaging is disabled), this is indicated by the setting of COCOn. If hardware averaging is enabled, COCOn sets only, if the last of the selected number of conversions is complete. If the compare function is enabled, COCOn sets and conversion result data is transferred only if the compare condition is true. If both hardware averaging and compare functions are enabled, then COCOn sets only if the last of the selected number of conversions is complete and the compare condition is true. An interrupt is generated, if ADC\_HCn[AIEN] is high at the time that COCOn is set and if DMAEN is set, DMA request is asserted, if COCOn is set. Both the requests get deasserted when COCOn is low, cleared, which happens when data is read.

In all modes a blocking mechanism prevents a new result from overwriting previous data in ADC\_Rn, if the previous data is in the process of being read. When blocking is active (OVWREN=0 in ADC\_CFG), the conversion result data transfer is blocked, COCOn is not set, and the new result is lost. In all other cases of operation, when a conversion result data transfer is blocked, another conversion is initiated regardless of the state of ADCO (single or continuous conversions enabled).

**Note**

If continuous conversions are enabled, the blocking mechanism could result in the loss of data occurring at specific timepoints. To avoid this issue, the data must be read in fewer cycles than an ADC conversion time, accounting for interrupt or software polling loop latency.

If single conversions are enabled, the blocking mechanism could result in several discarded conversions and excess power consumption. To avoid this issue, the data registers must not be read after initiating a single conversion until the conversion completes.

### 13.3.3.3 Aborting Conversions

Any conversion in progress is aborted when:

- The MCU enters stop mode with ADACK not enabled.
- In software trigger mode, write to ADC\_HC0 register, while ADC\_HC0 is actively (already) controlling a conversion, aborts the current conversion.
- A write to any ADC register other than the ADC\_HC0 register occurs. This indicates a mode of operation change has occurred and the current conversion is therefore invalid.

**Note**

When a conversion is aborted, the contents of the data result registers, ADCRn are not altered. The data result registers continue to hold the values, transferred after the completion of the last successful conversion. If the conversion is aborted by a reset or stop (not operated with internal ADACK), ADCRn (data result register) return to their reset states.

### 13.3.3.4 Power Control

The ADC module remains in its idle state until a conversion is initiated. If ADACK is selected as the conversion clock source but the asynchronous clock output is disabled (ADACKEN=0), the ADACK clock generator will also remain in its idle state (disabled) until a conversion is initiated. If the asynchronous clock output is enabled (ADACKEN=1), it will remain active regardless of the state of the ADC or the MCU power mode.

Power consumption when the ADC is active can be reduced by setting ADLPC.

### 13.3.3.5 Sample Time and Total Conversion Time

The total conversion time depends upon the following:

- the sample phase time (as determined by ADLSMP and ADSTS bits in ADC\_CFG register),
- the compare phase time (determined by MODE bits)
- the frequency of the conversion clock ( $f_{ADCK}$ ).
- the MCU bus frequency (for Handshaking and selection of clock)

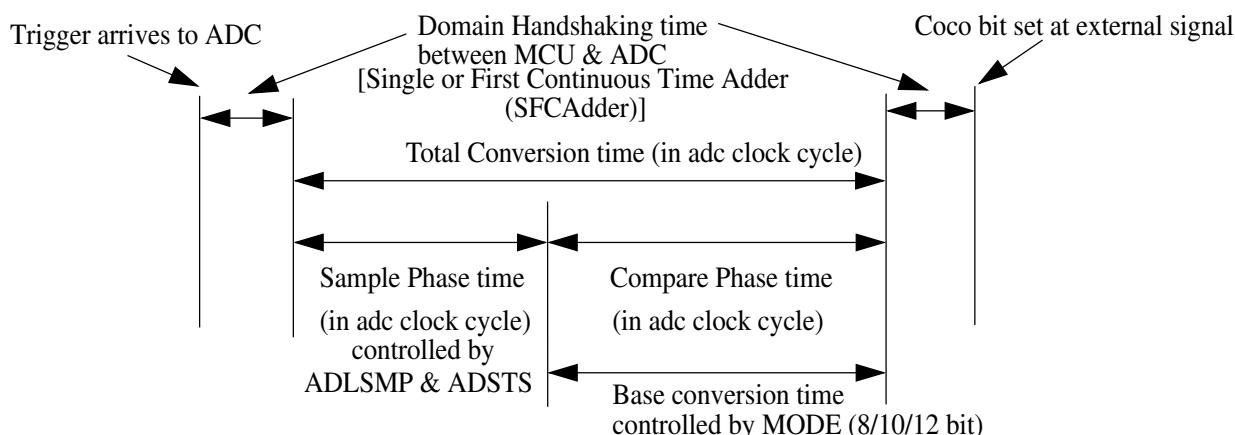

Figure 13-4. ADC conversion time details

After the module becomes active, sampling of the input begins. ADLSMP and ADSTS decide the sample time duration. When sampling is complete, the converter is isolated from the input channel and a successive approximation algorithm is performed to determine the digital value of the analog signal. The result of the conversion is transferred to ADC\_Rn upon completion of the conversion algorithm.

## Functional Description

If the bus frequency is less than the f<sub>ADCK</sub> frequency, precise sample time for continuous conversions cannot be guaranteed.

The maximum total conversion time is determined by the clock source chosen and the divide ratio selected. The clock source is selectable by the ADICLK bits in ADC\_CFG register, and the divide ratio is specified by the ADIV bits.

The maximum total conversion time for all configurations is summarized in [Equation 1 on page 402](#). Refer to [Table 13-2](#) through [Table 13-5](#) for the variables referenced in the equation.

$$\text{ConversionTime} = \text{SFCAdder} + \text{AverageNum} \times (\text{BCT} + \text{LST Adder})$$

### Equation 1. Equation of Conversion Time

**Table 13-2. Single or First Continuous Time Adder (SFCAdder)**

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
x	0x, 10	3 ADCK cycles (before starting of conversion) + 1ADCK (after end of conversion) + 2 bus clock cycles
1	11	3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) + 2 bus clock cycles
0	11	1.5μs + 3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) + 2 bus clock cycles

**Table 13-3. Average Number Factor (AverageNum)**

AVGE	AVGS[1:0]	Average Number Factor (AverageNum)
0	xx	1
1	00	4
1	01	8
1	10	16
1	11	32

**Table 13-4. Base Conversion Time (BCT) (compare phase duration)**

Mode	Base Conversion Time (BCT) (compare phase duration)
8 bit	17 ADCK cycles

*Table continues on the next page...*

**Table 13-4. Base Conversion Time (BCT) (compare phase duration) (continued)**

Mode	Base Conversion Time (BCT) (compare phase duration)
10 bit	21 ADCK cycles
12 bit	25 ADCK cycles

**Table 13-5. Long Sample Time**

ADLSMP	ADLSTS	Long Sample Time Adder (LSTAdder)
0	00	3 ADCK cycles
0	01	5 ADCK cycles
0	10	7 ADCK cycles (default)
0	11	9 ADCK cycles
1	00	13 ADCK cycles
1	01	17 ADCK cycles
1	10	21 ADCK cycles
1	11	25 ADCK cycles

### Note

The ADCK frequency must be between  $f_{ADCK}$  minimum and  $f_{ADCK}$  maximum to meet ADC specifications.

### 13.3.3.6 Conversion Time Examples

The following examples uses [Equation 1 on page 402](#) and the information provided in tables [Table 13-2](#) through [Table 13-5](#).

#### 13.3.3.6.1 Typical conversion time configuration

A typical configuration for ADC conversion is: 10-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, ADLSMP=0,ADLSTS=10 and high speed conversion disabled. The conversion time for a single conversion is calculated by using [Equation 1 on page 402](#) and the information provided in [Table 13-6](#) through [Table 13-8](#). The table below list the variables of [Equation 1 on page 402](#).

**Table 13-6. Typical Conversion Time**

Variable	Time
SFCAdder	5 ADCK cycles + 5 bus clock cycles
AverageNum	1

*Table continues on the next page...*

**Table 13-6. Typical Conversion Time (continued)**

Variable	Time
BCT	21 ADCK cycles
LSTAdder	7

The resulting conversion time is generated using the parameters listed in [Table 13-6](#). So for Bus clock equal to 40 Mhz and ADCK equal to 40 Mhz the resulting conversion time is 0.95 us.

### 13.3.3.6.2 Long conversion time configuration

A configuration for long ADC conversion is: 12-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-8 ratio selected, and a bus frequency of 40 MHz, long sample time enabled (ADLSMP=1, ADSTS=11) and configured for longest adder and high speed conversion disabled. Average enabled for 32 conversions (AVGE=1, AVGS=11). The conversion time for this conversion is calculated by using equation on [Sample Time and Total Conversion Time](#) and the information provided in [Table 13-2](#) through [Table 13-5](#). The table below lists the variables of equation.

**Table 13-7. Typical Conversion Time**

Variable	Time
SFCAdder	3 ADCK cycles + 5 bus clock cycles
AverageNum	32
BCT	25 ADCK cycles
LSTAdder	25 ADCK cycles

The resulting conversion time is generated using the parameters listed in [Table 13-7](#). So for Bus clock equal to 40 Mhz and ADCK equal to 5 Mhz the resulting conversion time is 10.0226 us (AverageNum). This results in a total conversion time of 320.725 us.

### 13.3.3.6.3 Short conversion time configuration

A configuration for short ADC conversion is: 8-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, long sample time disabled(ADLSMP=0, ADSTS=00) and high speed conversion enabled. The conversion time for this conversion is calculated by using the equation and the information provided in [Table 13-2](#) to [Table 13-5](#). The table below list the variables of equation.

**Table 13-8. Typical Conversion Time**

Variable	Time
SFCAdder	3 ADCK cycles + 5 bus clock cycles
AverageNum	1
BCT	17 ADCK cycles
LSTAdder	3 ADCK cycles

The resulting conversion time is generated using the parameters listed in [Table 13-8](#). So for Bus clock equal to 40Mhz and ADCK equal to 40Mhz the resulting conversion time is 700 ns.

### 13.3.3.7 Hardware Average Function

The hardware average function can be enabled (AVGE=1) to perform a hardware average of multiple conversions. The number of conversions is determined by the AVGS[1:0] bits, which select 4, 8, 16 or 32 conversions to be averaged. While the hardware average function is in progress the ADACT bit will be set.

After the selected input is sampled and converted, the result is placed in an accumulator from which an average is calculated once the selected number of conversions has been completed. When hardware averaging is selected the completion of a single conversion will not set the COCOn bit.

If the compare function is either disabled or evaluates true, after the selected number of conversions are completed, the average conversion result is transferred into the data result registers, ADC\_Rn , and the COCOn bit is set. An ADC interrupt is generated upon the setting of COCOn if the respective ADC interrupt is enabled (AIENn=1).

### 13.3.4 Automatic Compare Function

The compare function can be configured to check if the result is less than or greater-than-or-equal-to a single compare value, or if the result falls within or outside a range determined by two compare values. The compare mode is determined by ACFGT, ACREN and the values in the compare value register (ADC\_CV). After the input is sampled and converted, the compare values (CV1 and CV2) are used as described in the table below. There are six compare modes as shown in the table below.

**Table 13-9. Compare Modes**

ACFGT	ACREN	CV1 relative to CV2	Function	Compare Mode Description
0	0	-	Less than threshold	Compare true if the result is less than the CV1 registers.
1	0	-	Greater than or equal to threshold	Compare true if the result is greater than or equal to CV1 registers.
0	1	Less than or equal	Outside range, not inclusive	Compare true if the result is less than CV1 <b>Or</b> the result is Greater than CV2
0	1	Greater than	Inside range, not inclusive	Compare true if the result is less than CV1 <b>And</b> the result is greater than CV2
1	1	Less Than or equal	Inside range, inclusive	Compare true if the result is greater than or equal to CV1 <b>And</b> the result is less than or equal to CV2
1	1	Greater than	Outside range, inclusive	Compare true if the result is greater than or equal to CV1 <b>Or</b> the result is less than or equal to CV2

With the ADC range enable bit set, ADCREN =1, if compare value 1(CV1 value) is less than or equal to the compare value 2 (CV2 value), setting ACFGT will select a trigger-if-inside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-outside-compare-range, not-inclusive-of-endpoints function.

If CV1 is greater than the CV2, setting ACFGT will select a trigger-if-outside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-inside-compare-range, not-inclusive-of-endpoints function.

If the condition selected evaluates true, COCOn is set.

Upon completion of a conversion while the compare function is enabled, if the compare condition is not true, COCOn is not set and the conversion result data will not be transferred to the result register. If the hardware averaging function is enabled, the compare function compares the averaged result to the compare values. The same compare function definitions apply. An ADC interrupt is generated upon the setting of COCOn if the respective ADC interrupt is enabled (ADC\_HCn[AIEN]=1).

### Note

The compare function can monitor the voltage on a channel while the MCU is in wait or stop3 mode. The ADC interrupt wakes the MCU when the compare condition is met.

### 13.3.5 Calibration Function

The ADC contains a self-calibration function that is required to achieve the specified accuracy. Calibration should be run or valid calibration values should be written after power up and system reset (as the calibration register will be reset on reset assertion) with specified settings before any conversion is initiated. The calibration function sets the calibration value at the end of running the full calibration sequence in ADC\_CAL register. The user must configure the ADC correctly prior to starting the calibration process, and must allow the process to run the full calibration sequence by checking the status of ADC\_GC[CAL] and ADC\_GS[CALF] so that the generated calibration value can be loaded.

Prior to calibration, the user must configure the ADC's clock source and frequency, low power configuration, voltage reference selection, sample time, averaging, and the high speed configuration according to the application's clock source availability and needs. If the application uses the ADC in a wide variety of configurations, the configuration for which the highest accuracy is required should be selected, or multiple calibrations can be done for the different configurations. The input channel, conversion mode, continuous function and compare function are all ignored during the calibration process.

To initiate calibration, the user sets the CAL bit and the calibration will automatically begin if the ADTRG bit = 0. If ADTRG = 1, the CAL bit will not get set and the calibration fail flag (CALF) will be set. While calibration is active, no ADC register can be written and no stop mode may be entered or the calibration routine will be aborted causing the CAL bit to clear and the CALF bit to set.

At the end of a calibration sequence the COCO[0] bit of the ADC\_HS register will be set. The ADC\_HCn[AIEN] bit can be used to allow an interrupt to occur at the end of a calibration sequence. If, at the end of calibration routine, the CALF bit is not set, the automatic calibration routine completed successfully.

To complete calibration, the user must follow the below procedure :

- Configure ADC\_CFG with actual operating values for maximum accuracy.
- Configure the ADC\_GC values along with CAL bit
- Check the status of CALF bit in ADC\_GS and the CAL bit in ADC\_GC
- When CAL bit becomes '0' then check the CALF status and COCO[0] bit status

When complete the user may reconfigure and use the ADC as desired.

A second calibration may also be performed if desired by clearing and again setting the CAL bit

Overall the calibration routine may take as many as 14000 ADCK cycles and 100 bus cycles, depending on the results and the clock source chosen.

### 13.3.6 User Defined Offset Function

The ADC Offset Correction Register (ADC\_OFS) contains the user configured offset value. This register is 13 bit wide. The value in MSB (13th bit) is the operation bit, if this bit is ‘0’ then the value in rest 12 bit is added with the converted result value to generate final result to be loaded into ADC\_Rn and if this bit is ‘1’ then this field is subtracted from converted value to generate final Result (ADC\_Rn). If the Final result is above the maximum or below the minimum result value, it is forced to the appropriate limit for the current mode of operation. Forced to 0x0FFF if over and 0x0000 if lower for 12 bit mode.

The offset value has no effect during calibration on the final result.

The formatting of the ADC Offset Register is different from the Data Result Registers (ADC\_Rn) to preserve the resolution of the value regardless of the conversion mode selected. Lower order bits are ignored in lower resolution modes. For example, in 8b single-ended mode, the bits OFS[11:4] are subtracted from D[7:0] when bit OFS[12] (sign bit) is ‘1’ ; indicates subtraction and bits OFS[4:0] are ignored. For 12b single-ended mode, bits OFS[11:0] are directly subtracted from the conversion result data CDATA[11:0] when OFS[12] (sign bit) is ‘1’. The similar is the addition operation when OFS[12](sign bit) is 0.

ADC\_OFS is manually set according to user requirements once the self calibration sequence is done (CAL is cleared). The user have to write ADC\_OFS with desired value.

#### NOTE

There is an effective limit to the values of Offset that can be set by the user. If the magnitude of the offset is too great the results of the conversions will cap off at the limits.

The offset function may be employed by the user to remove application offsets or DC bias values. An offset correction that results in an out-of-range value will be forced to the minimum or maximum value.

For applications which may change the offset repeatedly during operation, it is recommended to store the initial offset value in flash so that it can be recovered and added to any user offset adjustment value and the sum stored in the ADC\_OFS registers.

### 13.3.7 MCU Wait Mode Operation

Wait mode is a **lower power-consumption standby mode** from which **recovery is fast** because **the clock sources remain active**. If a conversion is in progress when the MCU enters wait mode, it continues until completion. Conversions can be initiated while the MCU is in wait mode if continuous conversions are enabled.

The bus clock, bus clock divided by two, and ADACK are available as conversion clock sources while in wait mode.

A conversion complete event sets the COCOn and generates an ADC interrupt to wake the MCU from wait mode.

If the compare and hardware averaging functions are disabled, a conversion complete event sets the COCOn and generates an ADC interrupt to wake the MCU from wait mode if the respective ADC interrupt is enabled (ADC\_HCn[AIEN]=1).

If the hardware averaging function is enabled the COCOn will set (and generate an interrupt if enabled) when the selected number of conversions are complete.

If the compare function is enabled the COCOn will set (and generate an interrupt if enabled) only if the compare conditions are met.

If a single conversion is selected and the compare trigger is not met, the ADC will return to its idle state and cannot wake the MCU from wait mode.

### 13.3.8 MCU Stop Mode Operation

Stop mode is a low power-consumption standby mode during which most or all clock sources on the MCU are disabled. Stop mode is entered when stop indication comes from the MCU.

#### 13.3.8.1 Stop Mode With ADACK Disabled

If the asynchronous clock, ADACK, is not selected as the conversion clock, executing a stop instruction aborts the current conversion and places the ADC in its idle state. The contents of the ADC registers, including ADC\_Rn are unaffected by stop mode. After exiting from stop mode, a software trigger is required to resume conversions.

### 13.3.8.2 Stop Mode With ADACK Enabled

If ADACK is selected as the conversion clock, the ADC continues operation during stop mode. For guaranteed ADC operation, the MCU's voltage regulator must remain active during stop mode.

If a conversion is in progress when the MCU enters stop mode, it continues until completion. Conversions can be initiated while the MCU is in stop mode if continuous conversions are enabled.

A conversion complete event sets the COCOn and generates an ADC interrupt to wake the MCU from stop mode :

#### Note

The ADC module can wake the system from low-power stop and cause the MCU to begin consuming run-level currents without generating a system level interrupt. To prevent this scenario, software should ensure the conversion result data transfer blocking mechanism (discussed in [Completing Conversions](#)) is cleared when entering stop and continuing ADC conversions.

## 13.4 Initialization Information

This section gives an example that provides some basic direction on how to initialize and configure the ADC module. User can configure the module for 8, 10, 12 bit resolution, single or continuous conversion, and a polled or interrupt approach, among many other options.

### 13.4.1 ADC Module Initialization Example

This section describes the initialization sequence along with pseudo-code.

#### 13.4.1.1 Initialization Sequence

Before the ADC module can be used to complete conversions, an initialization procedure must be performed. A typical sequence is as follows:

- Calibrate the ADC by following the calibration instructions in [Calibration Function](#)

- Update the configuration register (ADC\_CFG) to select the input clock source and the divide ratio used to generate the internal clock, ADCK. This register is also used for selecting sample time and low-power configuration.
- Update General control register (ADC\_GC) to select whether conversions will be continuous or completed only once (ADCO) and to select whether to perform hardware averaging, etc.
- Update Trigger control register (ADC\_HCn) to select the conversion trigger and compare function options, if enabled.

### 13.4.1.2 Pseudo-Code Example

In this example, the ADC module is set up with interrupts enabled to perform a single 10-bit conversion at low power with a long sample time on input channel 1, where the internal ADCK clock is derived from the bus clock divided by 1.

#### ADC\_CFG

Bit 7	ADLPC	1	Configures for low power (lowers maximum clock speed).
Bit 6:5	ADIV	00	Sets the ADCK to the input clock $\div$ 1.
Bit 4	ADLSMP	1	Configures for long sample time.
Bit 3:2	MODE	10	Sets mode at 10-bit conversions.
Bit 1:0	ADICLK	00	Selects bus clock as input clock source.

#### ADC\_GC

Bit 7	CAL	0	Flag indicates if a conversion is in progress.
Bit 6	ADCO	0	Software trigger selected.
Bit 5	AVGE	0	Compare function disabled.
Bit 4	ACFE	0	Compare function disabled.
Bit 3	ACFGT	0	Not used in this example.
Bit 2	ACREN	0	Not used in this example.
Bit 1	DMAEN	0	Not used in this example.
Bit 0	ADACKEN	0	Not used in this example.

#### ADC\_HC0

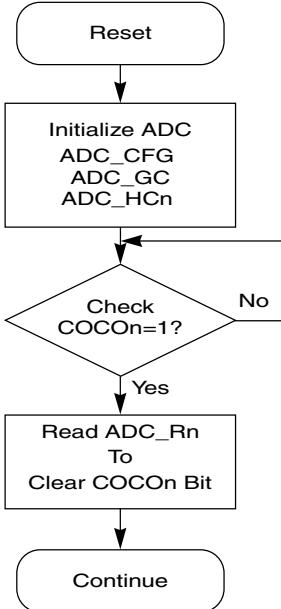

Bit 7	AIEN	1	Conversion complete interrupt enabled.
Bit 4:0	ADCH	00001	Input channel 1 selected as ADC input channel.

#### ADC\_R0

Holds results of conversion. Read high byte (ADCRHA) before low byte (ADCRLA) so that conversion data cannot be overwritten with data from the next conversion.

#### ADC\_CV

Holds compare values when compare function enabled.

**Figure 13-5. Initialization Flowchart for Example**

## 13.5 Application Information

This section contains information for using the ADC module in applications. The ADC has been designed to be integrated into a microcontroller for use in embedded control applications requiring an A/D converter.

### 13.5.1 Sources of Error

Several sources of error exist for A/D conversions. These are discussed in the following sections.

#### 13.5.1.1 Sampling Error

For proper conversions, the input must be sampled long enough to achieve the proper accuracy. Given the maximum input resistance of approximately  $7\text{k}\Omega$  and input capacitance of approximately 1.3 pF, sampling to within 1/4LSB (at 12-bit resolution) can be achieved within the nominal sample window (6 cycles @ 40 MHz maximum ADCK frequency) provided the resistance of the external analog source ( $R_{AS}$ ) is kept below 4 k $\Omega$ .

Higher source resistances or higher-accuracy sampling is possible by setting ADLSMP and changing the ADSTS bits (to increase the sample window) or decreasing ADCK frequency to increase sample time.

### 13.5.1.2 Pin Leakage Error

Leakage on the I/O pins can cause conversion error if the external analog source resistance ( $R_{AS}$ ) is high. If this error cannot be tolerated by the application, keep  $R_{AS}$  lower than  $V_{DDAD}/(2^N \cdot I_{LEAK})$  for less than 1/4LSB leakage error ( $N = 8$  in 8-bit, 10 in 10-bit or 12 in 12-bit mode).

### 13.5.1.3 Noise-Induced Errors

System noise that occurs during the sample or conversion process can affect the accuracy of the conversion. The ADC accuracy numbers are guaranteed as specified only if the following conditions are met:

- There is a 0.1  $\mu$ F low-ESR capacitor from  $V_{REFH}$  to  $V_{REFL}$ .
- There is a 0.1  $\mu$ F low-ESR capacitor from  $V_{DDAD}$  to  $V_{SSAD}$ .
- If inductive isolation is used from the primary supply, an additional 1  $\mu$ F capacitor is placed from  $V_{DDAD}$  to  $V_{SSAD}$ .
- $V_{SSAD}$  (and  $V_{REFL}$ , if connected) is connected to  $V_{SS}$  at a quiet point in the ground plane.
- Operate the MCU in wait or stop mode immediately after initiating (software triggered conversions) the ADC conversion.
  - For software triggered conversions, immediately follow the write to ADCSC1 with a wait instruction or stop instruction.
  - For stop mode operation, select ADACK as the clock source. Operation in stop reduces  $V_{DD}$  noise but increases effective conversion time due to stop recovery.
- There is no I/O switching, input or output, on the MCU during the conversion.

There are some situations where external system activity causes radiated or conducted noise emissions or excessive  $V_{DD}$  noise is coupled into the ADC. In these situations, or when the MCU cannot be placed in wait or stop or I/O activity cannot be halted, these recommended actions may reduce the effect of noise on the accuracy:

- Place a 0.01  $\mu\text{F}$  capacitor (CAS) on the selected input channel to  $V_{\text{REFL}}$  or  $V_{\text{SS}}$  (this improves noise issues, but affects the sample rate based on the external analog source resistance).
- Average the result by converting the analog input many times in succession and dividing the sum of the results. Four samples are required to eliminate the effect of a 1LSB, one-time error.
- Reduce the effect of synchronous noise by operating off the asynchronous clock (ADACK) and averaging. Noise that is synchronous to ADCK cannot be averaged out.

### 13.5.1.4 Code Width and Quantization Error

#### Note

This will remain the same as long as the result is rounded for 8 and 10-bit modes. If the result is truncated in 8/10b modes then they will match 12b mode where the quantization error is -1 to 0.

The ADC quantizes the ideal straight-line transfer function into 4096 steps (in 12-bit mode). Each step ideally has the same height (1 code) and width. The width is defined as the delta between the transition points to one code and the next. The ideal code width for an N bit converter (in this case N can be 8, 10 or 12), defined as 1LSB, is:

$$\text{1lsb} = (V_{\text{REFH}} - V_{\text{REFL}}) / 2^N$$

There is an inherent quantization error due to the digitization of the result. For 8-bit or 10-bit conversions the code transitions when the voltage is at the midpoint between the points where the straight line transfer function is exactly represented by the actual transfer function. Therefore, the quantization error will be  $\pm 1/2$  lsb in 8- or 10-bit mode. As a consequence, however, the code width of the first (0x000) conversion is only 1/2 lsb and the code width of the last (0xFF or 0x3FF) is 1.5 lsb.

For 12-bit conversions the code transitions only after the full code width is present, so the quantization error is -1 lsb to 0 lsb and the code width of each step is 1 lsb.

### 13.5.1.5 Linearity Errors

The ADC may also exhibit non-linearity of several forms. Every effort has been made to reduce these errors but the system should be aware of them because they affect overall accuracy. These errors are:

- Zero-scale error ( $E_{ZS}$ ) (sometimes called offset) — This error is defined as the difference between the actual code width of the first conversion and the ideal code width ( $1/2$  lsb in 8-bit or 10-bit modes and 1 lsb in 12-bit mode). If the first conversion is 0x001, the difference between the actual 0x001 code width and its ideal (1 lsb) is used.
- Full-scale error ( $E_{FS}$ ) — This error is defined as the difference between the actual code width of the last conversion and the ideal code width ( $1.5$  lsb in 8-bit or 10-bit modes and 1LSB in 12-bit mode). If the last conversion is 0x3FE, the difference between the actual 0x3FE code width and its ideal (1LSB) is used.
- Differential non-linearity (DNL) — This error is defined as the worst-case difference between the actual code width and the ideal code width for all conversions.
- Integral non-linearity (INL) — This error is defined as the highest-value the (absolute value of the) running sum of DNL achieves. More simply, this is the worst-case difference of the actual transition voltage to a given code and its corresponding ideal transition voltage, for all codes.
- Total unadjusted error (TUE) — This error is defined as the difference between the actual transfer function and the ideal straight-line transfer function and includes all forms of error.

### 13.5.1.6 Code Jitter, Non-Monotonicity, and Missing Codes

Analog-to-digital converters are susceptible to three special forms of error. These are code jitter, non-monotonicity, and missing codes.

Code jitter is when, at certain points, a given input voltage converts to one of two values when sampled repeatedly. Ideally, when the input voltage is infinitesimally smaller than the transition voltage, the converter yields the lower code (and vice-versa). However, even small amounts of system noise can cause the converter to be indeterminate (between two codes) for a range of input voltages around the transition voltage. This range is normally around  $\pm 1/2$  lsb in 8-bit or 10-bit mode, or around 2 lsb in 12-bit mode, and increases with noise.

This error may be reduced by repeatedly sampling the input and averaging the result. Additionally the techniques discussed in [Noise-Induced Errors](#) reduces this error.

## Memory map and register definition

Non-monotonicity is defined as when, except for code jitter, the converter converts to a lower code for a higher input voltage. Missing codes are those values never converted for any input value.

In 8-bit or 10-bit mode, the ADC is guaranteed to be monotonic and have no missing codes.

## 13.6 Memory map and register definition

The ADC-Digital contains 32-bit, word aligned, byte enables registers; byte or half word access are not supported. All configuration registers are accessible via 32-bit access bus Interface. Write access to reserved locations have no impact while read access to reserved locations always return 0.

### NOTE

No protection or indication mechanism is available (for example, 32-bit access starting with address offset value 0x01 or 0x02 or 0x03). The ADC does not check for correctness of the programmed values in the registers and the programmer must ensure that correct values are being written.

ADC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 13.6.1 Control register (ADCx\_HC0)

ADC\_HC0 is used to control software triggers. Writing ADC\_HC0 while ADC\_HC0 is actively controlling a conversion aborts the current conversion. In software trigger mode (ADTRG=0), writes to ADC\_HC0 subsequently initiate a new conversion (if the ADCH bits are equal to a value other than all 1s).

Address: Base address + 0h offset

#### ADCx\_HS field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 COCO0	<p>Conversion Complete Flag</p> <p>The COCOOn flag is a read-only bit that is set each time a conversion is completed when the compare function is disabled (ADC_GC[ACFE]=0) and the hardware average function is disabled (ADC_GC[AVGE]=0). When the compare function is enabled (ADC_GC[ACFE]=1), the COCOOn flag is set upon completion of a conversion only if the compare result is true. When the hardware average function is enabled (ADC_GC[AVGE]=1), the COCOOn flag is set upon completion of the selected number of conversions (determined by the ADC_CFG[AVGS] field). The COCOOn flag will also set at the completion of a Calibration and Test sequence. A COCOOn bit is cleared when the respective ADC_HCn is written or when the respective ADC_Rn is read.</p>

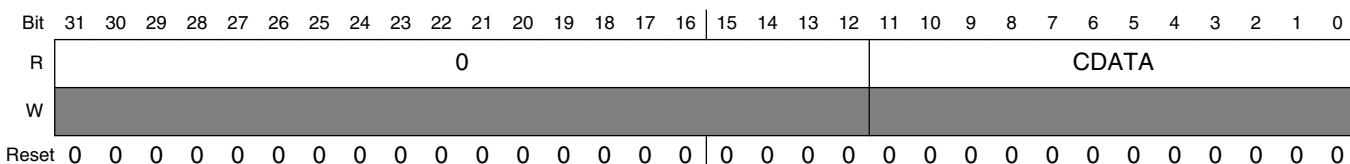

### 13.6.3 Data result register (ADCx\_R0)

Contains the result of an ADC conversion of the channel selected by the respective channel control register (ADC\_HC0). Unused bits in the ADC\_Rn register are cleared in unsigned right justified modes. For example when configured for 10-bit single-ended mode, D[31:10] are cleared. The table below describes the behavior of the data result registers in the different modes of operation.

**Table 13-10. Data Result Register Description**

Conversion Mode	Data Result Register bits																Format
	D31	D30	...	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ADCx\_GC field descriptions**

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 CAL	Calibration  CAL begins the calibration sequence when set. This bit stays set while the calibration is in progress and is cleared when the calibration sequence is complete. The ADC_GS[CALF] bit must be checked to determine the result of the calibration sequence. Once started, the calibration routine cannot be interrupted by writes to the ADC registers or the results will be invalid and the ADC_GS[CALF] bit will set. Setting the CAL bit will abort any current conversion.
6 ADCO	Continuous Conversion Enable  Enables continuous conversions.  0 One conversion or one set of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion. 1 Continuous conversions or sets of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion.
5 AVGE	Hardware average enable  Enables the hardware average function of the ADC.  0 Hardware average function disabled 1 Hardware average function enabled
4 ACFE	Compare Function Enable  Enables the compare function.  0 Compare function disabled 1 Compare function enabled
3 ACFGT	Compare Function Greater Than Enable  Configures the compare function to check the conversion result relative to the compare value register (ADC_CV) based upon the value of ACREN (bit 2 in ADC_GC register). The ACFE bit must be set for ACFGT to have any effect.  0 Configures "Less Than Threshold, Outside Range Not Inclusive and Inside Range Not Inclusive" functionality based on the values placed in the ADC_CV register. 1 Configures "Greater Than Or Equal To Threshold, Outside Range Inclusive and Inside Range Inclusive" functionality based on the values placed in the ADC_CV registers.
2 ACREN	Compare Function Range Enable  Configures the compare function to check the conversion result of the input being monitored is either between or outside the range formed by the compare values in register (ADC_CV) determined by the value of ACFGT. The ACFE bit must be set for ACFGT to have any effect.  0 Range function disabled. Only the compare value 1 of ADC_CV register (CV1) is compared. 1 Range function enabled. Both compare values of ADC_CV registers (CV1 and CV2) are compared.
1 DMAEN	DMA Enable  Enables the DMA logic.

*Table continues on the next page...*

**ADCx\_GC field descriptions (continued)**

Field	Description
	0 DMA disabled (default) 1 DMA enabled
0 ADACKEN	Asynchronous clock output enable  Enables the ADC's asynchronous clock source and the clock source output regardless of the conversion and input clock select (ADC_CFG[ADICLK]) settings of the ADC. Based on MCU configuration, the asynchronous clock may be used by other modules (see module introduction section). Setting this bit allows the clock to be used even while the ADC is idle or operating from a different clock source. Also, latency of initiating a single or first-continuous conversion with the asynchronous clock selected is reduced since the ADACK clock is already operational.  0 Asynchronous clock output disabled; Asynchronous clock only enabled if selected by ADICLK and a conversion is active. 1 Asynchronous clock and clock output enabled regardless of the state of the ADC

**13.6.6 General status register (ADCx\_GS)**

Indicates the status of the asynchronous wakeup interrupt, calibration failure and conversion active functions.

Address: Base address + 1Ch offset

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
2 AWKST	<p>Asynchronous wakeup interrupt status</p> <p>Holds the status of asynchronous interrupt status that occurred during stop mode. This bit is set when ipg_stop is deasserted and ipg_clk has started. It is cleared by writing '1' to it. Clearing this bit also deasserts the Asynchronous interrupt to CPU.</p>
	<ul style="list-style-type: none"> <li>1 Asynchronous wake up interrupt occurred in stop mode.</li> <li>0 No asynchronous interrupt.</li> </ul>
1 CALF	<p>Calibration Failed Flag</p> <p>Displays the result of the calibration sequence. The calibration sequence will fail if any ADC register is written, or any stop mode is entered before the calibration sequence completes. The CALF bit is cleared by writing a 1 to it.</p>
	<ul style="list-style-type: none"> <li>0 Calibration completed normally.</li> <li>1 Calibration failed. ADC accuracy specifications are not guaranteed.</li> </ul>
0 ADACT	<p>Conversion Active</p> <p>Indicates that a conversion or hardware averaging is in progress. ADACT is set when a conversion is initiated and cleared when a conversion is completed or aborted.</p>
	<ul style="list-style-type: none"> <li>0 Conversion not in progress.</li> <li>1 Conversion in progress.</li> </ul>

### 13.6.7 Compare value register (ADCx\_CV)

Contains compare values used to compare with the conversion result when the compare function is enabled (ADC GC[ACFE]=1). The compare values are right justified.

Therefore, the compare function only uses the compare value register bits that are related to the ADC mode of operation. (e.g. in 8 bit mode,  $CV1 = ADC\_CV[7:0]$  and  $CV2 = ADC\_CV[23:16]$ , similarly in 10 bit mode,  $CV1 = ADC\_CV[9:0]$  and  $CV2 = ADC\_CV[25:16]$  etc.) The compare value 2 in this register is utilized only when the compare range function is enabled ( $ADC\_GC[ACREN]=1$ ).

Address: Base address + 20h offset

**ADCx\_CV field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CV2	Compare Value 2  Contains a compare value used to compare with the conversion result when the compare function and compare range function are enabled (ADC_GC[ACFE]=1, ADC_GC[ACREN]=1).
15–12 Reserved	This read-only field is reserved and always has the value 0.
CV1	Compare Value 1  Contains a compare value used to compare with the conversion result when the compare function is enabled (ADC_GC[ACFE]=1).

**13.6.8 Offset correction value register (ADCx\_OFS)**

Contains the user-defined offset error correction value. This register is 13 bits wide. The value in the most significant bit (13th bit) is the operation bit. If this bit is ‘0’ then the value in the other 12 bits is added with the converted result value to generate final result to be loaded into ADC\_Rn; if this bit is ‘1’ then this field is subtracted from converted value to generate final result (ADC\_Rn).

Address: Base address + 24h offset

12 SIGN	Sign bit  0 The offset value is added with the raw result 1 The offset value is subtracted from the raw converted value
OFS	Offset value  User configurable offset value.

### 13.6.9 Calibration value register (ADCx\_CAL)

Contains calibration information that is generated by the calibration function. This register contains a calibration value of four bits(CAL[3:0]); this is automatically set once the self calibration sequence is done (ADC\_SC[CAL] bit is cleared). If this register is written to by the user after calibration, the linearity error specifications may not be met.

Address: Base address + 28h offset

#### ADCx\_CAL field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
CAL_CODE	Calibration Result Value  This value is automatically loaded and updated at the end of calibration.

## 13.7 Memory map and register definition

The ADC-Digital contains 32-bit, word aligned, byte enables registers; byte or half word access are not supported. All configuration registers are accessible via 32-bit access bus Interface. Write access to reserved locations have no impact while read access to reserved locations always return 0.

### NOTE

No protection or indication mechanism is available (for example, 32-bit access starting with address offset value 0x01 or 0x02 or 0x03). The ADC does not check for correctness of the programmed values in the registers and the programmer must ensure that correct values are being written.

### 13.7.1 Control register for hardware triggers (ADCx\_HC0)

ADC\_HC0 can be used for both software and hardware trigger mode. Other ADC\_HC $n$  ( $n = 1\dots$ ) are for use only in hardware trigger mode. The ADC\_HC0 to ADC\_HC $n$  ( $n = 0,1$ ) registers have identical fields, and are used to control ADC operation. At any one point in time, only one of the ADC\_HC0 to ADC\_HC $n$  ( $n = 0,1$ ) registers is actively controlling ADC conversions. Updating ADC\_HC0 while ADC\_HC $n$  ( $n = 0,1$ ) is actively controlling a conversion is allowed (and vice-versa for any of the ADC\_HC $n$  ( $n = 0,1$ ) registers). Writing ADC\_HC0 while ADC\_HC0 is actively controlling a conversion aborts the current conversion. In software trigger mode (ADTRG=0), writes to ADC\_HC0 subsequently initiates a new conversion (if the ADCH bits are equal to a value other than all 1s). Similarly, writing any of the ADC\_HC $n$  ( $n = 0,1$ ) registers while that specific ADC\_HC register is actively controlling a conversion aborts the current conversion. ADC\_HC1 register is not used for software trigger operation and therefore writes to any of them do not initiate a new conversion.

### 13.7.3 Status register for HW triggers (ADCx\_HS)

Bit 0 is used for both software and hardware trigger modes of operation. Bit 1 to bit (n-1) indicate the rest of the HW triggers' statuses similar to bit 0, potentially corresponding to multiple ADC\_HC registers (for use only in hardware trigger mode).

Address: Base address + 14h offset

#### ADCx\_HS field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 COCO4	See description for COCO0.
3 COCO3	See description for COCO0.
2 COCO2	See description for COCO0.
1 COCO1	See description for COCO0.
0 COCO0	Conversion Complete Flag

Table continues on the next page...

**ADCx\_HS field descriptions (continued)**

Field	Description
	The COCOn flag is a read-only bit that is set each time a conversion is completed when the compare function is disabled (ADC_GC[ACFE]=0) and the hardware average function is disabled (ADC_GC[AVGE]=0). When the compare function is enabled (ADC_GC[ACFE]=1), the COCOn flag is set upon completion of a conversion only if the compare result is true. When the hardware average function is enabled (ADC_GC[AVGE]=1), the COCOn flag is set upon completion of the selected number of conversions (determined by the ADC_CFG[AVGS] field). The COCO0 flag will also set at the completion of a Calibration and Test sequence. A COCOn bit is cleared when the respective ADC_HCn is written or when the respective ADC_Rn is read.

**13.7.4 Data result register for HW triggers (ADCx\_R0)**

Contains the result of an ADC conversion of the channel selected by the respective hardware trigger and channel control register (ADC\_HC0:ADC\_HCn). For every ADC\_HC0:ADC\_HCn status and channel control register, there is a respective ADC\_R0:ADC\_Rn data result register. Unused bits in the ADC\_Rn register are cleared in unsigned right justified modes. For example when configured for 10-bit single-ended mode, D[31:10] are cleared. The table below describes the behavior of the data result registers in the different modes of operation.

**Table 13-11. Data Result Register Description**

Conversion Mode	Data Result Register bits																Format

**ADCx\_CFG field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 OVWREN	Data Overwrite Enable  Controls the overwriting of the next converted Data onto the existing (previous) unread data into the Data result register.  1 Enable the overwriting. 0 Disable the overwriting. Existing Data in Data result register will not be overwritten by subsequent converted data.
15–14 AVGS	Hardware Average select  Determines how many ADC conversions will be averaged to create the ADC average result. This functionality is activated when ADC_GC[AVGE] = 1.  00 4 samples averaged 01 8 samples averaged 10 16 samples averaged 11 32 samples averaged
13 ADTRG	Conversion Trigger Select  Selects the type of trigger used for initiating a conversion. Two types of trigger are selectable: software trigger and hardware trigger. When software trigger is selected, a conversion is initiated following a write to ADC_HC0. When hardware trigger is selected, a conversion is initiated following the assertion of a pulse on Alternate Hardware trigger input along with the assertion of the enable of respective the hardware Triggers input.

**ADCx\_GC field descriptions**

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 CAL	Calibration  CAL begins the calibration sequence when set. This bit stays set while the calibration is in progress and is cleared when the calibration sequence is complete. The ADC_GS[CALF] bit must be checked to determine the result of the calibration sequence. Once started, the calibration routine cannot be interrupted by writes to the ADC registers or the results will be invalid and the ADC_GS[CALF] bit will set. Setting the CAL bit will abort any current conversion.
6 ADCO	Continuous Conversion Enable  Enables continuous conversions.  0 One conversion or one set of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion. 1 Continuous conversions or sets of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion.
5 AVGE	Hardware average enable  Enables the hardware average function of the ADC.  0 Hardware average function disabled 1 Hardware average function enabled
4 ACFE	Compare Function Enable  Enables the compare function.  0 Compare function disabled 1 Compare function enabled
3 ACFGT	Compare Function Greater Than Enable  Configures the compare function to check the conversion result relative to the compare value register (ADC_CV) based upon the value of ACREN (bit 2 in ADC_GC register). The ACFE bit must be set for ACFGT to have any effect.  0 Configures "Less Than Threshold, Outside Range Not Inclusive and Inside Range Not Inclusive" functionality based on the values placed in the ADC_CV register. 1 Configures "Greater Than Or Equal To Threshold, Outside Range Inclusive and Inside Range Inclusive" functionality based on the values placed in the ADC_CV registers.
2 ACREN	Compare Function Range Enable  Configures the compare function to check the conversion result of the input being monitored is either between or outside the range formed by the compare values in register (ADC_CV) determined by the value of ACFGT. The ACFE bit must be set for ACFGT to have any effect.  0 Range function disabled. Only the compare value 1 of ADC_CV register (CV1) is compared. 1 Range function enabled. Both compare values of ADC_CV registers (CV1 and CV2) are compared.
1 DMAEN	DMA Enable  Enables the DMA logic.

*Table continues on the next page...*

**ADCx\_GC field descriptions (continued)**

Field	Description
	0 DMA disabled (default) 1 DMA enabled
0 ADACKEN	Asynchronous clock output enable  Enables the ADC's asynchronous clock source and the clock source output regardless of the conversion and input clock select (ADC_CFG[ADICLK]) settings of the ADC. Based on MCU configuration, the asynchronous clock may be used by other modules (see module introduction section). Setting this bit allows the clock to be used even while the ADC is idle or operating from a different clock source. Also, latency of initiating a single or first-continuous conversion with the asynchronous clock selected is reduced since the ADACK clock is already operational.  0 Asynchronous clock output disabled; Asynchronous clock only enabled if selected by ADICLK and a conversion is active. 1 Asynchronous clock and clock output enabled regardless of the state of the ADC

**13.7.8 General status register (ADCx\_GS)**

Controls the calibration, continuous convert, hardware averaging functions, conversion active, hardware/software trigger select, compare function and voltage reference select of the ADC module.

Address: Base address + 34h offset

## ADCx GS field descriptions

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
2 AWKST	<p>Asynchronous wakeup interrupt status</p> <p>Holds the status of asynchronous interrupt status that occurred during stop mode. This bit is set when ipg_stop is deasserted and ipg_clk has started. It is cleared by writing '1' to it. Clearing this bit also deasserts the Asynchronous interrupt to CPU.</p>
	<ul style="list-style-type: none"> <li>1 Asynchronous wake up interrupt occurred in stop mode.</li> <li>0 No asynchronous interrupt.</li> </ul>
1 CALF	<p>Calibration Failed Flag</p> <p>Displays the result of the calibration sequence. The calibration sequence will fail if Hardware Trigger is selected (i.e. ADC_CFG[ADTRG] = 1), or any ADC register is written, or any stop mode is entered before the calibration sequence completes. The CALF bit is cleared by writing a 1 to it.</p>
	<ul style="list-style-type: none"> <li>0 Calibration completed normally.</li> <li>1 Calibration failed. ADC accuracy specifications are not guaranteed.</li> </ul>
0 ADACT	<p>Conversion Active</p> <p>Indicates that a conversion or hardware averaging is in progress. ADACT is set when a conversion is initiated and cleared when a conversion is completed or aborted.</p>
	<ul style="list-style-type: none"> <li>0 Conversion not in progress.</li> <li>1 Conversion in progress.</li> </ul>

### 13.7.9 Compare value register (ADCx\_CV)

Contains compare values used to compare with the conversion result when the compare function is enabled (ADC\_GC[ACFE]=1). The compare values are right justified. Therfore, the compare function only uses the compare value register bits that are related to the ADC mode of operation. (e.g. in 8 bit mode, CV1 = ADC\_CV[7:0] and CV2 = ADC\_CV[23:16], similarly in 10 bit mode, CV1 = ADC\_CV[9:0] and CV2 = ADC\_CV[25:16] etc.) The compare value 2 in this register is utilized only when the compare range function is enabled (ADC\_GC[ACREN]=1).

Address: Base address + 38h offset

**ADCx\_CV field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CV2	Compare Value 2  Contains a compare value used to compare with the conversion result when the compare function and compare range function are enabled (ADC_GC[ACFE]=1, ADC_GC[ACREN]=1).
15–12 Reserved	This read-only field is reserved and always has the value 0.
CV1	Compare Value 1  Contains a compare value used to compare with the conversion result when the compare function is enabled (ADC_GC[ACFE]=1).

**13.7.10 Offset correction value register (ADCx\_OFS)**

Contains the user-defined offset error correction value. This register is 13 bits wide. The value in the most significant bit (13th bit) is the operation bit. If this bit is ‘0’ then the value in the other 12 bits is added with the converted result value to generate final result to be loaded into ADC\_Rn; if this bit is ‘1’ then this field is subtracted from converted value to generate final result (ADC\_Rn).

Address: Base address + 3Ch offset

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 SIGN	Sign bit  0 The offset value is added with the raw result 1 The offset value is subtracted from the raw converted value
OFS	Offset value  User configurable offset value.

### 13.7.11 Calibration value register (ADCx\_CAL)

Contains calibration information that is generated by the calibration function. This register contains a calibration value of four bits(CAL[3:0]); this is automatically set once the self calibration sequence is done (ADC\_SC[CAL] bit is cleared). If this register is written to by the user after calibration, the linearity error specifications may not be met.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### ADCx\_CAL field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
CAL_CODE	Calibration Result Value  This value is automatically loaded and updated at the end of calibration.

# Chapter 14

## AHB to IP Bridge (AIPSTZ)

### 14.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

#### 14.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. Access permissions are based on bus master (e.g. DMA or core) privilege levels and resource domain. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

## 14.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 14-1. AIPSTZ Clocks**

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

## 14.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has three separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, n-2, and n-3 for AIPS-1, AIPS-2, and AIPS-3 respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

The AIPSTZ prevents access to a peripheral if the transaction originated from a source from a resource domain that has been explicitly omitted. Resource domains are assigned in the RDC submodule. Please refer to the RDC chapter for programming details.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

## 14.4 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

Masters and peripherals are assigned to one or more resource domains in the RDC submodule (see the RDC chapter for details). Depending on RDC programming, masters transactions through the AIPSTZ may or may not be allowed access to peripherals in different resource domains.

## 14.5 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

## Initialization Information

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

## 14.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ\_MPRs), the Peripheral Access Control registers (AIPSTZ\_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ\_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

### 14.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

**Table 14-2. Peripheral Access Configuration options**

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (sec\_config\_X) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 14-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

`sec_config_0 [7:0] = 8'b0011_0011`

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

**Table 14-3. Security Levels**

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your NXP representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line `csu\_sec\_level[2:0]' corresponding to each peripheral X.

## 14.7 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

**AIPSTZ memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
207_C000	Master Priviledge Registers (AIPSTZ1_MPR)	32	R/W	7700_0000h	<a href="#">14.7.1/449</a>

## 14.7.1 Master Priviledge Registers (AIPSTZx\_MPR)

Each AIPSTZ\_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 14-4](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 14-5](#).

**Table 14-4. MPROT Field**

Bit	Field	Description
3	MBW	<b>Master Buffer Writes</b> - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	<b>Master Trusted for Reads</b> - This bit determines whether the master is trusted for read accesses.
1	MTW	<b>Master Trusted for Writes</b> - This bit determines whether the master is trusted for write accesses.
0	MPL	<b>Master Privilege Level</b> - This bit determines how the privilege level of the master is determined.

### NOTE

The reset value is set to 0000\_0000\_7700\_0000, which makes master 0 and master 1 (Arm CORE) the trusted masters.  
Trusted software can change the settings after reset.

**Table 14-5. Master Index Allocation**

Master Index	Master Name	Comments
Master 0	All masters excluding Arm core, SDMA and CAAM	Share the same number allocation.
Master 1	Arm A7 CORE	
Master 2	CAAM	
Master 3	SDMA	
Master 4	Reserved	
Master 5	Arm M4 Core	
Master 6-15	Reserved

## 14.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZ\_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ\_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ\_OPACR has the following format shown in [Table 14-6](#)

**Table 14-6. OPAC Field**

Bit	Field	Description
3	BW	<b>Buffer Writes</b> - This bit determines whether write accesses to this peripheral are allowed to be buffered. <sup>1</sup>
2	SP	<b>Supervisor Protect</b> - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	<b>Write Protect</b> - This bit determines whether the peripheral allows write accesses.
0	TP	<b>Trusted Protect</b> - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

# **Chapter 15**

## **AHB-to-APBH Bridge with DMA (APBH-Bridge-DMA)**

### **15.1 Overview**

The AHB-to-APBH bridge provides the chip with an inexpensive peripheral attachment bus running on the AHB's HCLK. (The H in APBH denotes that the APBH is synchronous to HCLK.)

As shown in the figure below, the AHB-to-APBH bridge includes the AHB-to-APB PIO bridge for a memory-mapped I/O to the APB devices, as well as a central DMA facility for devices on this bus and a vectored interrupt controller for the Arm core. Each one of the APB peripherals, including the vectored interrupt controller, is documented in their respective chapters.

**Figure 15-1. AHB-to-APBH Bridge DMA Block Diagram**

The DMA controller uses the APBH bus to transfer read and write data to and from each peripheral. There is no separate DMA bus for these devices. Contention between the DMA's use of the APBH bus and the AHB-to-APB bridge functions' use of the APBH is mediated by an internal arbitration logic. For contention between these two units, the DMA is favored and the AHB slave will report "not ready" through its HREADY output until the bridge transfer can complete. The arbiter tracks repeated lockouts and inverts the priority, guaranteeing the Arm platform every fourth transfer on the APB.

## 15.2 Clocks

The table found here describes the clock sources for APBH. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 15-1. APBH Clocks**

Clock name	Clock Root	Description
hclk	bch_clk_root	Module clock

## 15.3 APBH DMA

The DMA supports four channels of DMA services, as shown in the following table. The shared DMA resource allows each independent channel to follow a simple chained command list. Command chains are built up using the general structure, as shown in [Figure 15-2](#).

**Table 15-2. APBH DMA channel assignments**

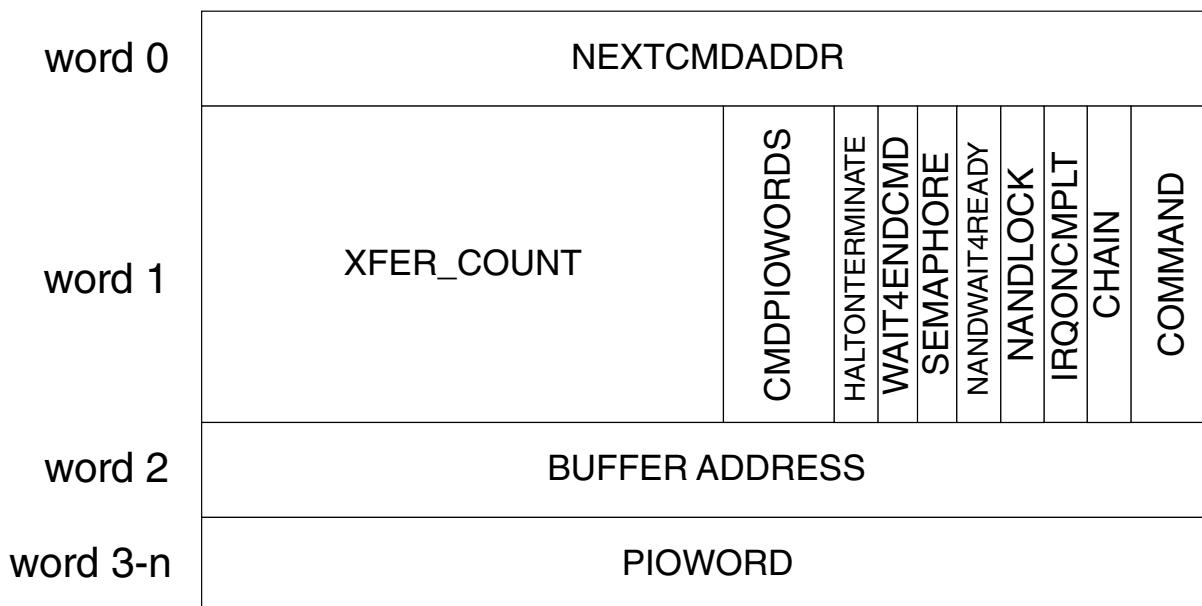

APBH DMA Channel #	Usage
0	GPMI0
1	GPMI1
2	GPMI2
3	GPMI3

A single command structure or channel command word specifies a number of operations to be performed by the DMA in support of a given device. Thus, the Arm platform can set up large units of work, chaining together many DMA channel command words, pass them off to the DMA, and have no further concern for the device until the DMA completion interrupt occurs. The goal is to have enough intelligence in the DMA and the devices to keep the interrupt frequency from any device below 1 KHz (arrival intervals longer than 1 ms).

A single command structure can issue 32-bit PIO write operations to key registers in the associated device using the same APB bus and controls that it uses to write DMA data bytes to the device. For example, this allows a chain of operations to be issued to the GPMI controller to send NAND command bytes, address bytes, and data transfers where the command and the address structure is completely under software control, but the administration of that transfer is handled autonomously by the DMA. Each DMA structure can have 0–15 PIO words appended to it. The CMDPIOWORDS field, if non-zero, instructs the DMA engine to copy these words to the APB, beginning at the first register address offset for the peripheral and incrementing the register offset each cycle.

The DMA master generates only normal read/write transfers to the APBH. It does *not* generate set, clear, or toggle (SCT) transfers.

After any requested PIO words have been transferred to the peripheral, the DMA examines the two-bit command field in the channel command structure. [Table 15-3](#) shows the four commands implemented by the DMA.

**Figure 15-2. AHB-to-APBH Bridge DMA channel command structure**

**Table 15-3. APBH DMA commands**

DMA Command	Usage
00	NO_DMA_XFER. Perform any requested PIO word transfers, but terminate the command before any DMA transfer.
01	DMA_WRITE. Perform any requested PIO word transfers, then perform a DMA transfer from the peripheral for the specified number of bytes.
10	DMA_READ. Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes.
11	DMA_SENSE. Perform any requested PIO word transfers, then perform a conditional branch to the next chained device. Follow the NEXTCMD_ADDR pointer if the peripheral sense is false. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is true. This command becomes a no-operation for any channel other than a GPMI channel.

DMA\_WRITE operations copy data bytes to the system memory (on-chip RAM or SDRAM) from the associated peripheral.

DMA\_READ operations copy data bytes to the APB peripheral from the system memory. The DMA engine contains a shared byte aligner that aligns bytes from system memory to or from the peripherals. Peripherals always assume little-endian-aligned data arrives or departs on their 32-bit APB. The DMA\_READ transfer uses the BUFFER\_ADDRESS word in the command structure to point to the DMA data buffer to be read by the DMA\_READ command.

The NO\_DMA\_XFER command is used to write PIO words to a device without performing any DMA data byte transfers. This command is useful in such applications as activating the NAND devices CHECKSTATUS operation. The check status command reads a status byte from the NAND device, performs an XOR and MASK against an expected value supplied as part of the PIO transfer. Once the read check completes (see [NAND Read Status Polling Example](#)), the NO\_DMA\_XFER command completes. The result in the peripheral is that its sense line is driven by the results of the comparison. The sense flip-flop is only updated by CHECKSTATUS for the device that is executed. At some future point, the chain contains a DMA command structure with the fourth and final command value, that is, the DMA\_SENSE command.

As each DMA command completes, it triggers the DMA to load the next DMA command structure in the chain. The normal flow list of DMA commands is found by following the NEXTCMD\_ADDR pointer in the DMA command structure. The DMA\_SENSE command uses the DMA buffer pointer word of the command structure to point to an alternate DMA command structure chain or list. The DMA\_SENSE command examines the sense line of the associated peripheral. If the sense line is false, then the DMA follows the standard list found whose next command is found from the pointer in the NEXTCMD\_ADDR word of the command structure. If the sense line is true, then the DMA follows the alternate list whose next command is found from the pointer in the DMA Buffer Pointer word of the DMA\_SENSE command structure (see [Figure 15-2](#)). The sense command ignores the CHAIN bit, so that both pointers must be valid when the DMA comes to a sense command.

If the wait-for-end-command bit (WAIT4ENDCMD) is set in a command structure, the DMA channel waits for the device to signal completion of a command by toggling the endcmd signal before proceeding to load and execute the next command structure. Then, if DECREMENT\_SEMAPHORE is set, the semaphore is decremented after the end command is seen.

A detailed bit-field view of the DMA command structure is shown in the following table, which shows a field that specifies the number of bytes to be transferred by this DMA command. The transfer-count mechanism is duplicated in the associated peripheral, either as an implied or as a specified count in the peripheral.

**Table 15-4. DMA channel command word in system memory**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
NEXT_COMMAND_ADDRESS																															

*Table continues on the next page...*

**Table 15-4. DMA channel command word in system memory (continued)**

Number DMA Bytes to Transfer	Number PIO Words to Write	HALT/TERMINATE	WAIT4ENDCMD	DECREMENT SEMAPHORE	NANDWAIT4READY	NANDLOCK	IRQ_COMPLETE	CHAIN	COMMAND
DMA Buffer or Alternate CCW									
Zero or More PIO Words to Write to the Associated Peripheral Starting at its Base Address on the APBH Bus									

Figure 15-2 also shows the CHAIN bit in bit 2 of the second word of the command structure. This bit is set to 1, if the NEXT\_COMMAND\_ADDRESS contains a pointer to another DMA command structure. If a null pointer (0) is loaded into the NEXT\_COMMAND\_ADDRESS, it is not detected by the DMA hardware. Only the CHAIN bit indicates whether a valid list exists beyond the current structure.

If the IRQ\_COMPLETE bit is set in the command structure, then the last act of the DMA before loading the next command is to set the interrupt-status bit corresponding to the current channel. The sticky interrupt request bit in the DMA CSR remains set until cleared by the software. It can be used to interrupt the Arm platform.

The NAND\_LOCK bit is monitored by the DMA channel arbiter. Once a NAND channel (from channel 0 to channel 3) succeeds in the arbiter with its NAND\_LOCK bit set, then the arbiter ignores the other NAND channels until a command is completed in which the NAND\_LOCK is not set. Notice that the semantic here is that the NAND\_LOCK state is to limit scheduling of a non-locked DMA. A DMA channel can go from unlocked to locked in the arbiter at the beginning of a command when the NAND\_LOCK bit is set. When the last DMA command of an atomic sequence is completed, the lock should be removed. To accomplish this, the last command does not have the NAND\_LOCK bit. It is still locked in the atomic state within the arbiter when the command starts, so that it is the only NAND command that can be executed. At the end, it drops from the atomic state within the arbiter.

The NAND\_WAIT4READY bit also has a special use for GPMI channels (from channel 0 to channel 3), i.e., the NAND device channels. The GPMI peripheral supplies a sample of the ready line from the NAND device. This ready value is used to hold off of a command with this bit set until the ready line is asserted to 1. Once the arbiter sees a command with a wait-for-ready set, it holds off that channel until ready is asserted.

Receiving an IRQ for HALTONTERMINATE (HOT) is a feature in the APBH DMA descriptor that allows GPMI to signal to the DMA engine that an error has occurred. If a command is stalled due to an error, a HOT signal is sent from the peripheral to the DMA engine and causes an IRQ after terminating the DMA descriptor being executed.

Therefore, it is recommended that software use this signal as follows:

- Always set HALTONTERMINATE to 1 in a DMA descriptor. That way, if a peripheral signals HOT, the transfer will end, leaving the peripheral block and the DMA engine synchronized (but at the end of a command).
- When an IRQ from an APBH channel is received, and the IRQ is determined to be due to an error (as opposed to an IRQONCOMPLETE interrupt) the software should:
  - Reset the channel.
  - Determine the error from error reporting in the peripheral block, then manage the error in the peripheral that is attached to that channel in whatever appropriate way exists for that device (software recovery, device reset, block reset, etc).

Each channel has an eight-bit counting semaphore that controls whether it is in the idle state. When the semaphore is non-zero, the channel is ready to run, process commands and perform DMA transfers. Whenever a command finishes its DMA transfer, it checks the DECREMENT\_SEMAPHORE bit. If set, it decrements the counting semaphore. If the semaphore goes to 0 as a result, then the channel enters the idle state and remains there until the semaphore is incremented by the software. When the semaphore goes to non-zero and the channel is in its idle state, then it uses the value in the APBH\_CHn\_NXTCMDAR register (next command address register) to fetch a pointer to the next command to process.

### **NOTE**

This is a double indirect case. This method allows the software to append to a running command list under the protection of the counting semaphore.

To start processing the first time, software creates the command list to be processed. It writes the address of the first command into the APBH\_CHn\_NXTCMDAR register, and then writes 1 to the counting semaphore in APBH\_CHn\_SEMA. The DMA channel loads APBH\_CHn\_CURCMDAR register and then enters the normal state machine processing for the next command. When the software writes a value to the counting semaphore, it is added to the semaphore count by hardware, protecting the case where both hardware and software are trying to change the semaphore on the same clock edge.

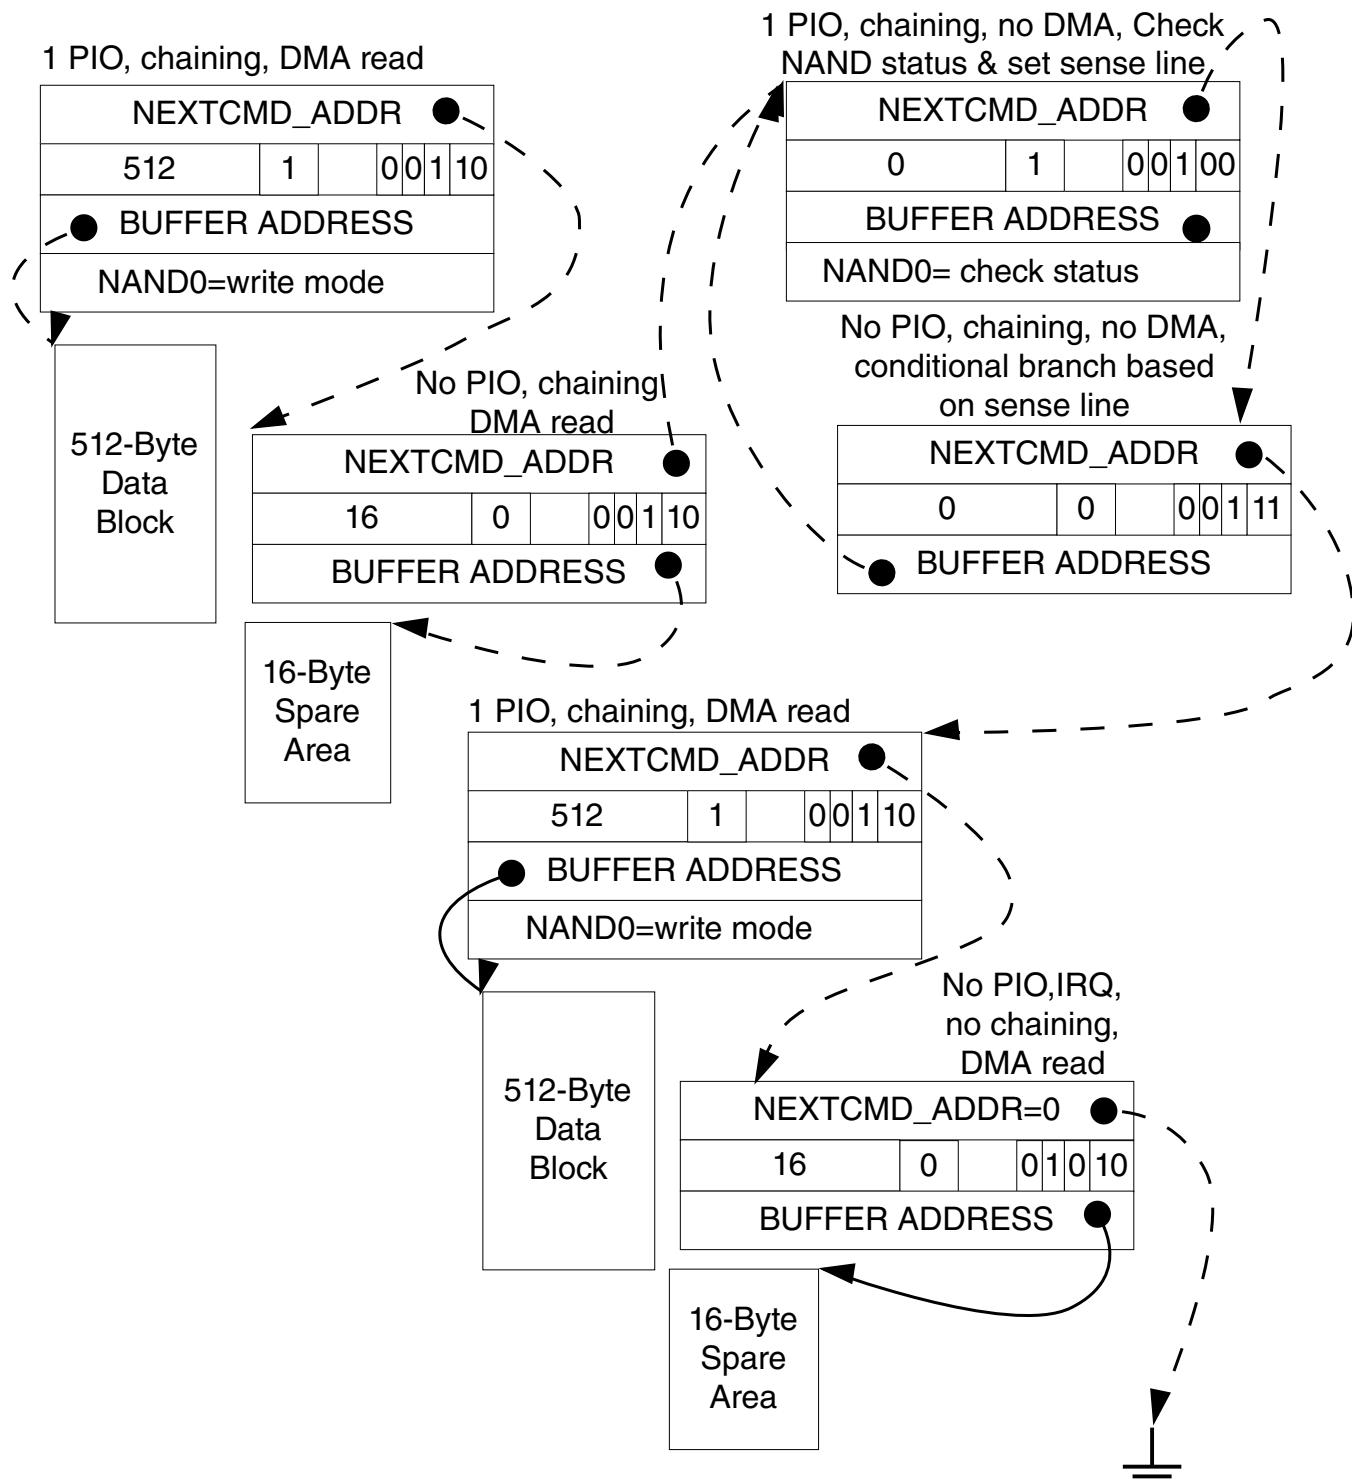

Software can examine the value of APBH\_CHn\_CURCMDAR at any time to determine the location of the command structure currently being processed.

## 15.4 NAND Read Status Polling Example

The following figure shows a more complicated scenario.

This subset of a NAND device workload shows that the first two command structures are used during the data-write phase of an NAND device write operation (CLE and ALE transfers omitted for clarity).

- After writing the data, one must wait until the NAND device status register indicates that the write charge has been transferred. This is built into the workload using a check status command in the NAND in a loop created from the next two DMA command structures.
- The NO\_DMA\_TRANSFER command is shown here performing the read check, followed by a DMA\_SENSE command to branch the DMA command structure list, based on the status of a bit in the external NAND device.

**Figure 15-3. AHB-to-APBH Bridge DMA NAND Read Status Polling with DMA Sense Command**

The example in the above figure shows the workload continuing immediately to the next NAND page transfer. However, one could perform a second sense operation to see if an error has occurred after the write. One could then point the sense command alternate branch at a NO\_DMA\_XFER command with the interrupt bit set. If the CHAIN bit is not

set on this failure branch, then the Arm platform is interrupted immediately, and the channel process is also immediately terminated in the presence of a workload-detected NAND error bit.

Note that each word of the three-word DMA command structure corresponds to a PIO register of the DMA that is accessible on the APBH bus. Normally, the DMA copies the next command structure onto these registers for processing at the start of each command by following the value of the pointer previously loaded into the NEXTCMD\_ADDR register.

To start DMA processing for the first command, initialize the PIO registers of the desired channel, as follows:

- First, load the next command address register with a pointer to the first command to be loaded.
- Then, write 1 to the counting semaphore register. This causes the DMA to schedule the targeted channel for the DMA command structure load, just as if it had finished its previous command.

## 15.5 APBH Memory Map/Register Definition

### APBH Hardware Register Format Summary

**APBH memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
180_4000	AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0)	32	R/W	E000_0000h	<a href="#">15.5.1/480</a>
180_4004	AHB to APBH Bridge Control and Status Register 0 (APBH_CTRL0_SET)	32	R/W	E000_0000h	<a href="#">15.5.1/480</a>

## 15.5.1 AHB to APBH Bridge Control and Status Register 0 (APBH\_CTRL0n)

The APBH CTRL 0 provides overall control of the AHB to APBH bridge and DMA.

This register contains module softreset, clock gating, channel clock gating/freeze bits.

Address: 180\_4000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### APBH\_CTRL0n field descriptions

Field	Description																		
31 SFTRST	Set this bit to zero to enable normal APBH DMA operation. Set this bit to one (default) to disable clocking with the APBH DMA and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the APBH DMA block to its default state.																		
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.																		
29 AHB_BURST8_EN	Set this bit to one (default) to enable AHB 8-beat burst. Set to zero to disable 8-beat burst on AHB interface.																		
28 APB_BURST_EN	Set this bit to one to enable apb master do a continuous transfers when a device request a burst dma. Set to zero will treat a burst dma request as 4/8 individual requests.																		
27–16 RSVD0	This field is reserved. Reserved, always set to zero.																		
CLKGATE_CHANNEL	<p>These bits must be set to zero for normal operation of each channel. When set to one they gate off the individual clocks to the channels.</p> <table> <tr><td>0x0001</td><td><b>NAND0</b> —</td></tr> <tr><td>0x0002</td><td><b>NAND1</b> —</td></tr> <tr><td>0x0004</td><td><b>NAND2</b> —</td></tr> <tr><td>0x0008</td><td><b>NAND3</b> —</td></tr> <tr><td>0x0010</td><td><b>NAND4</b> —</td></tr> <tr><td>0x0020</td><td><b>NAND5</b> —</td></tr> <tr><td>0x0040</td><td><b>NAND6</b> —</td></tr> <tr><td>0x0080</td><td><b>NAND7</b> —</td></tr> <tr><td>0x0100</td><td><b>SSP</b> —</td></tr> </table>	0x0001	<b>NAND0</b> —	0x0002	<b>NAND1</b> —	0x0004	<b>NAND2</b> —	0x0008	<b>NAND3</b> —	0x0010	<b>NAND4</b> —	0x0020	<b>NAND5</b> —	0x0040	<b>NAND6</b> —	0x0080	<b>NAND7</b> —	0x0100	<b>SSP</b> —

## 15.5.2 AHB to APBH Bridge Control and Status Register 1 (APBH\_CTRL1n)

The APBH CTRL one provides overall control of the interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

### EXAMPLE

```
BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0); // use bitfield write macro
```

## APBH Memory Map/Register Definition

```
BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0; // or, assign to register
struct's bitfield
```

Address: 180\_4000h base + 10h offset + (4d x i), where i=0d to 3d

### APBH\_CTRL1n field descriptions

Field	Description
31 CH15_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 15.
30 CH14_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 14.
29 CH13_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 13.
28 CH12_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 12.
27 CH11_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 11.
26 CH10_CMDCMPLT_IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 10.

Table continues on the next page...

**APBH\_CTRL1n field descriptions (continued)**

Field	Description
25 CH9_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 9.
24 CH8_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 8.
23 CH7_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 7.
22 CH6_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 6.
21 CH5_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 5.
20 CH4_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 4.
19 CH3_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 3.
18 CH2_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 2.
17 CH1_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 1.
16 CH0_ CMDCMPLT_ IRQ_EN	Setting this bit enables the generation of an interrupt request for APBH DMA channel 0.
15 CH15_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 15. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
14 CH14_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 14. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

*Table continues on the next page...*

**APBH\_CTRL1n field descriptions (continued)**

Field	Description
13 CH13_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 13. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
12 CH12_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 12. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
11 CH11_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 11. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
10 CH10_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 10. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
9 CH9_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 9. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
8 CH8_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA Channel 8. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
7 CH7_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 7. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
6 CH6_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 6. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
5 CH5_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 5. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
4 CH4_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 4. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
3 CH3_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 3. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
2 CH2_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 2. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

*Table continues on the next page...*

**APBH\_CTRL1n field descriptions (continued)**

Field	Description
1 CH1_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 1. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.
0 CH0_ CMDCMPLT_ IRQ	Interrupt request status bit for APBH DMA channel 0. This sticky bit is set by DMA hardware and reset by software. It is ANDed with its corresponding enable bit to generate an interrupt.

### 15.5.3 AHB to APBH Bridge Control and Status Register 2 (APBH\_CTRL2n)

The APBH CTRL 2 provides channel error interrupts generated by the AHB to APBH DMA. This register contains the per channel interrupt status bits and the per channel interrupt enable bits. Each channel has a dedicated interrupt vector in the vectored interrupt controller.

#### EXAMPLE

```
BF_WR(APBH_CTRL1, CH5_CMDCMPLT_IRQ, 0); // use bitfield write macro
BF_APBH_CTRL1.CH5_CMDCMPLT_IRQ = 0; // or, assign to register
struct's bitfield
```

### 15.5.5 AHB to APBH DMA Device Assignment Register (APBH\_DEVSEL)

This register allows reassignment of the APBH device connected to the DMA Channels.

In this chip, APBH DMA channel resource is enough for high speed peripherals, so this register is of no use and reserved.

Address: 180\_4000h base + 40h offset = 180\_4040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	Reserved

11–10 CH5	DMA burst size for GPMI channel 5. Do not change. GPMI only support burst size 4.
9–8 CH4	DMA burst size for GPMI channel 4. Do not change. GPMI only support burst size 4.
7–6 CH3	DMA burst size for GPMI channel 3. Do not change. GPMI only support burst size 4.
5–4 CH2	DMA burst size for GPMI channel 2. Do not change. GPMI only support burst size 4.
3–2 CH1	DMA burst size for GPMI channel 1. Do not change. GPMI only support burst size 4.
CH0	DMA burst size for GPMI channel 0. Do not change. GPMI only support burst size 4.

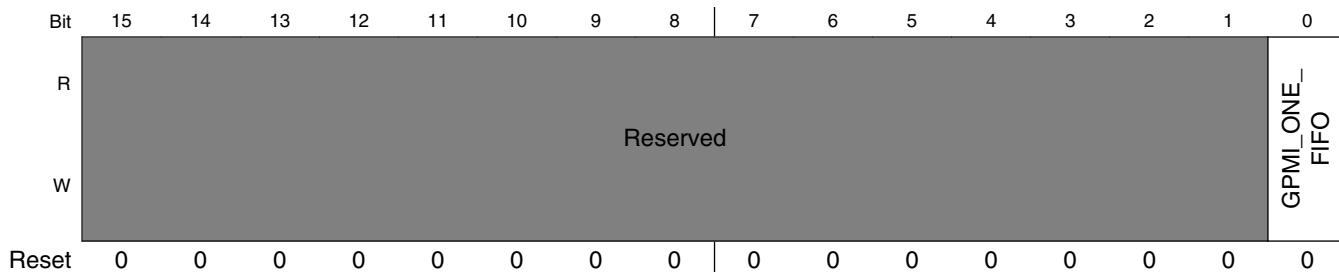

**15.5.7 AHB to APBH DMA Debug Register (APBH\_DEBUG)**

This register is for debug purpose.

The debug register is for internal use only. Not recommend for customer usage.

Address: 180\_4000h base + 60h offset = 180\_4060h

**APBH\_DEBUG field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved, always set to zero.
0 GPMI_ONE_FIFO	Set to One and the 8 GPMI channels will share the DMA FIFO, and when set to zero, the 8 GPMI channels will use its own DMA FIFO.

**15.5.8 APBH DMA Channel n Current Command Address Register (APBH\_CHn\_CURCMDAR)**

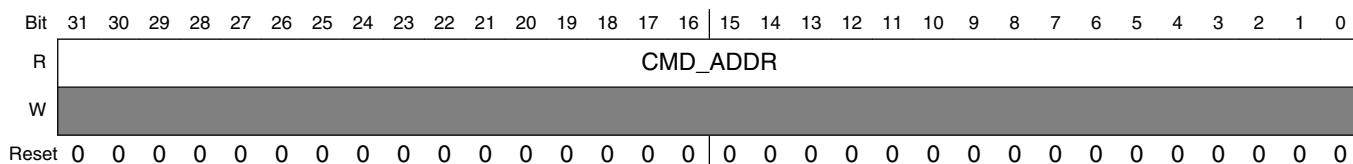

The APBH DMA channel n current command address register points to the multiword command that is currently being executed. Commands are threaded on the command address.

APBH DMA Channel n is controlled by a variable sized command structure. This register points to the command structure currently being executed.

**EXAMPLE**

```
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR_RD(0); // read the whole
register, since there is only one field
pCurCmd = (apbh_chn_cmd_t *) BF_RDn(APBH_CHn_CURCMDAR, 0, CMD_ADDR); // or, use multi-
register bitfield read macro
pCurCmd = (apbh_chn_cmd_t *) APBH_CHn_CURCMDAR(0).CMD_ADDR; // or, assign from
bitfield of indexed register's struct
```

Address: 180\_4000h base + 100h offset + (112d × i), where i=0d to 15d

**APBH\_CHn\_CURCMDAR field descriptions**

Field	Description
CMD_ADDR	Pointer to command structure currently being processed for channel n.

### 15.5.9 APBH DMA Channel n Next Command Address Register (APBH\_CHn\_NXTCMDAR)

The APBH DMA Channel n Next Command Address register contains the address of the next multiword command to be executed. Commands are threaded on the command address. Set CHAIN to 1 in the DMA command word to process command lists.

APBH DMA Channel n is controlled by a variable sized command structure. Software loads this register with the address of the first command structure to process and increments the Channel n semaphore to start processing. This register points to the next command structure to be executed when the current command is completed.

#### EXAMPLE

```
APBH_CHn_NXTCMDAR_WR(0, (reg32_t) pCommandTwoStructure);           // write the entire
register, since there is only one field
BF_WRN(APBH_CHn_NXTCMDAR, 0, (reg32_t) pCommandTwoStructure);       // or, use multi-
register bitfield write macro
APBH_CHn_NXTCMDAR(0).CMD_ADDR = (reg32_t) pCommandTwoStructure;    // or, assign to bitfield
of indexed register's struct
```

Address: 180\_4000h base + 110h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**APBH\_CHn\_NXTCMDAR field descriptions**

Field	Description
CMD_ADDR	Pointer to next command structure for channel n.

### 15.5.10 APBH DMA Channel n Command Register (APBH\_CHn\_CMD)

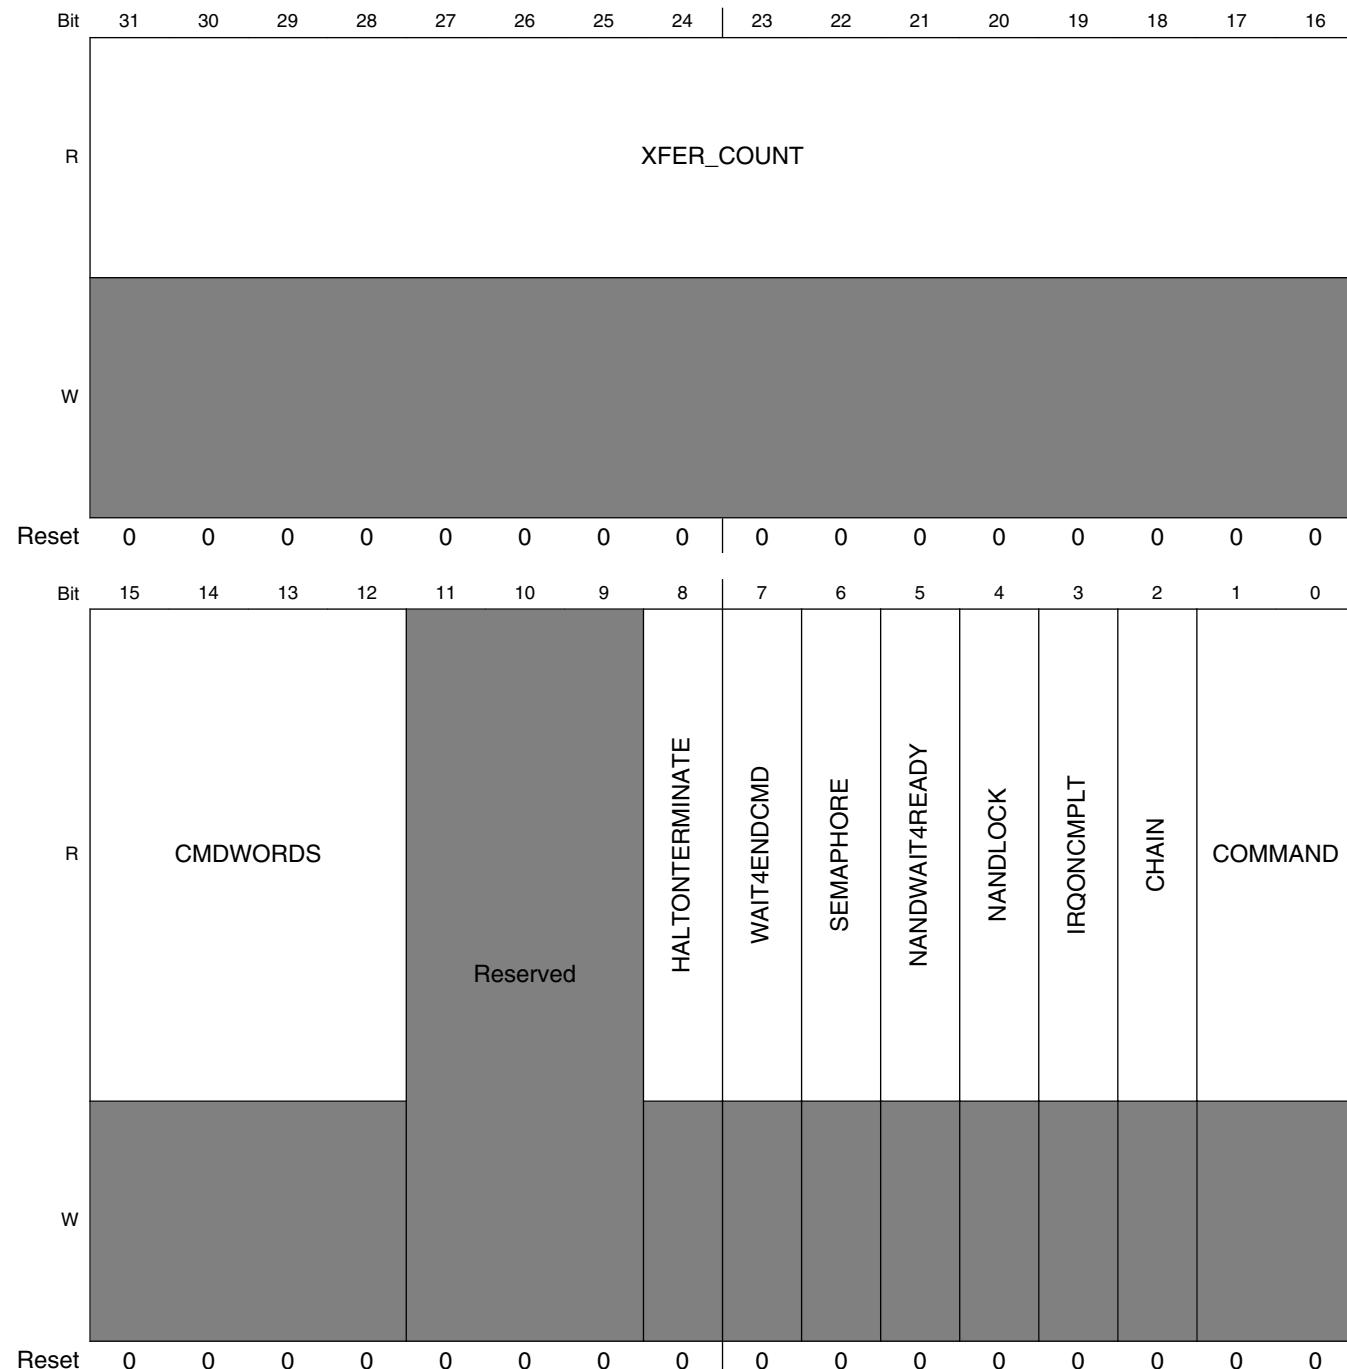

The APBH DMA Channel n command register specifies the DMA transaction to perform for the current command chain item.

The command register controls the overall operation of each DMA command for this channel. It includes the number of bytes to transfer to or from the device, the number of APB PIO command words included with this command structure, whether to interrupt at command completion, whether to chain an additional command to the end of this one and whether this transfer is a read or write DMA transfer.

## EXAMPLE

```
apbh_chn_cmd_t dma_cmd;
dma_cmd.XFER_COUNT = 512; // transfer 512 bytes
dma_cmd.COMMAND = BV_APBH_CHn_CMD_COMMAND__DMA_WRITE; // transfer to system memory from
peripheral device
dma_cmd.CHAIN = 1; // chain an additional command
structure on to the list
dma_cmd.IRQONCMPLT = 1; // generate an interrupt on
completion of this command structure
```

Address: 180\_4000h base + 120h offset + (112d × i), where i=0d to 15d

**APBH\_CHn\_CMD field descriptions**

Field	Description
31–16 XFER_COUNT	This field indicates the number of bytes to transfer to or from the appropriate PIO register in the GPMI0 device. A value of 0 indicates a 64 KBytes transfer.
15–12 CMDWORDS	This field indicates the number of command words to send to the GPMI0, starting with the base PIO address of the GPMI0 control register and incrementing from there. Zero means transfer NO command words
11–9 -	This field is reserved. Reserved, always set to zero.
8 HALTONTERMINATE	A value of one indicates that the channel will immediately terminate the current descriptor and halt the DMA channel if a terminate signal is set. A value of 0 will still cause an immediate terminate of the channel if the terminate signal is set, but the channel will continue as if the count had been exhausted, meaning it will honor IRQONCMPLT, CHAIN, SEMAPHORE, and WAIT4ENDCMD.
7 WAIT4ENDCMD	A value of one indicates that the channel will wait for the end of command signal to be sent from the APBH device to the DMA before starting the next DMA command.
6 SEMAPHORE	A value of one indicates that the channel will decrement its semaphore at the completion of the current command structure. If the semaphore decrements to zero, then this channel stalls until software increments it again.
5 NANDWAIT4READY	A value of one indicates that the NAND DMA channel will wait until the NAND device reports "ready" before executing the command. It is ignored for non-NAND DMA channels.
4 NANDLOCK	A value of one indicates that the NAND DMA channel will remain "locked" in the arbiter at the expense of other NAND DMA channels. It is ignored for non-NAND DMA channels.
3 IRQONCMPLT	A value of one indicates that the channel will cause the interrupt status bit to be set upon completion of the current command, i.e. after the DMA transfer is complete.
2 CHAIN	A value of one indicates that another command is chained onto the end of the current command structure. At the completion of the current command, this channel will follow the pointer in APBH_CHn_CMDAR to find the next command.
COMMAND	<p>This bitfield indicates the type of current command:</p> <ul style="list-style-type: none"> <li>0x0 <b>NO_DMA_XFER</b> — Perform any requested PIO word transfers but terminate command before any DMA transfer.</li> <li>0x1 <b>DMA_WRITE</b> — Perform any requested PIO word transfers and then perform a DMA transfer from the peripheral for the specified number of bytes.</li> <li>0x2 <b>DMA_READ</b> — Perform any requested PIO word transfers and then perform a DMA transfer to the peripheral for the specified number of bytes.</li> <li>0x3 <b>DMA_SENSE</b> — Perform any requested PIO word transfers and then perform a conditional branch to the next chained device. Follow the NEXCMD_ADDR pointer if the peripheral sense is true. Follow the BUFFER_ADDRESS as a chain pointer if the peripheral sense line is false.</li> </ul>

### 15.5.11 APBH DMA Channel n Buffer Address Register (APBH\_CHn\_BAR)

The APBH DMA Channel n buffer address register contains a pointer to the data buffer for the transfer. For immediate forms, the data is taken from this register. This is a byte address which means transfers can start on any byte boundary.

## APBH Memory Map/Register Definition

This register holds a pointer to the data buffer in system memory. After the command values have been read into the DMA controller and the device controlled by this channel, then the DMA transfer will begin, to or from the buffer pointed to by this register.

### EXAMPLE

```
apbh_chn_bar_t dma_data;
dma_data.ADDRESS = (reg32_t) pDataBuffer;
```

Address: 180\_4000h base + 130h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### APBH\_CHn\_BAR field descriptions

Field	Description
ADDRESS	Address of system memory buffer to be read or written over the AHB bus.

## 15.5.12 APBH DMA Channel n Semaphore Register (APBH\_CHn\_SEMA)

The APBH DMA Channel n semaphore register is used to synchronize the Arm platform instruction stream and the DMA chain processing state.

Each DMA channel has an 8 bit counting semaphore that is used to synchronize between the program stream and the DMA chain processing. DMA processing continues until the DMA attempts to decrement a semaphore that has already reached a value of zero. When the attempt is made, the DMA channel is stalled until software increments the semaphore count.

### EXAMPLE

```
BF_WR(APBH_CHn_SEMA, 0, INCREMENT_SEMA, 2); // increment semaphore by two
current_sema = BF_RD(APBH_CHn_SEMA, 0, PHORE); // get instantaneous value
```

Address: 180\_4000h base + 140h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**APBH\_CHn\_SEMA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 PHORE	This read-only field shows the current (instantaneous) value of the semaphore counter.
15–8 -	This field is reserved. Reserved, always set to zero.
INCREMENT_SEMA	The value written to this field is added to the semaphore count in an atomic way such that simultaneous software adds and DMA hardware subtracts happening on the same clock are protected. This bit field reads back a value of 0x00. Writing a value of 0x02 increments the semaphore count by two, unless the DMA channel decrements the count on the same clock, then the count is incremented by a net one.

**15.5.13 AHB to APBH DMA Channel n Debug Information  
(APBH\_CHn\_DEBUG1)**

This register gives debug visibility into the APBH DMA Channel n state machine and controls.

This register allows debug visibility of the APBH DMA Channel n.

## APBH Memory Map/Register Definition

**APBH\_CHn\_DEBUG1 field descriptions**

Field	Description
31 REQ	This bit reflects the current state of the DMA Request Signal from the APB device
30 BURST	This bit reflects the current state of the DMA Burst Signal from the APB device
29 KICK	This bit reflects the current state of the DMA Kick Signal sent to the APB Device
28 END	This bit reflects the current state of the DMA End Command Signal sent from the APB Device
27 SENSE	This field is reserved. This bit is reserved for this DMA Channel and always reads 0.
26 READY	This bit is reserved for this DMA Channel and always reads 0.
25 LOCK	This field is reserved. This bit is reserved for this Channel and always reads 0.
24 NEXTCMDADDRVALID	This bit reflects the internal bit which indicates whether the channel's next command address is valid.
23 RD_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Read FIFO Empty signal.
22 RD_FIFO_FULL	This bit reflects the current state of the DMA Channel's Read FIFO Full signal.
21 WR_FIFO_EMPTY	This bit reflects the current state of the DMA Channel's Write FIFO Empty signal.
20 WR_FIFO_FULL	This bit reflects the current state of the DMA Channel's Write FIFO Full signal.
19–5 RSVD1	This field is reserved. Reserved
STATEMACHINE	PIO Display of the DMA Channel n state machine state.  0x00 <b>IDLE</b> — This is the idle state of the DMA state machine. 0x01 <b>REQ_CMD1</b> — State in which the DMA is waiting to receive the first word of a command. 0x02 <b>REQ_CMD3</b> — State in which the DMA is waiting to receive the third word of a command. 0x03 <b>REQ_CMD2</b> — State in which the DMA is waiting to receive the second word of a command. 0x04 <b>XFER_DECODE</b> — The state machine processes the descriptor command field in this state and branches accordingly. 0x05 <b>REQ_WAIT</b> — The state machine waits in this state for the PIO APB cycles to complete. 0x06 <b>REQ_CMD4</b> — State in which the DMA is waiting to receive the fourth word of a command, or waiting to receive the PIO words when PIO count is greater than 1. 0x07 <b>PIO_REQ</b> — This state determines whether another PIO cycle needs to occur before starting DMA transfers. 0x08 <b>READ_FLUSH</b> — During a read transfers, the state machine enters this state waiting for the last bytes to be pushed out on the APB. 0x09 <b>READ_WAIT</b> — When an AHB read request occurs, the state machine waits in this state for the AHB transfer to complete. 0x0C <b>WRITE</b> — During DMA Write transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel. 0x0D <b>READ_REQ</b> — During DMA Read transfers, the state machine waits in this state until the AHB master arbiter accepts the request from this channel.

*Table continues on the next page...*

**APBH\_CHn\_DEBUG1 field descriptions (continued)**

Field	Description
	<p>0x0E <b>CHECK_CHAIN</b> — Upon completion of the DMA transfers, this state checks the value of the Chain bit and branches accordingly.</p> <p>0x0F <b>XFER_COMPLETE</b> — The state machine goes to this state after the DMA transfers are complete, and determines what step to take next.</p> <p>0x14 <b>TERMINATE</b> — When a terminate signal is set, the state machine enters this state until the current AHB transfer is completed.</p> <p>0x15 <b>WAIT_END</b> — When the Wait for Command End bit is set, the state machine enters this state until the DMA device indicates that the command is complete.</p> <p>0x1C <b>WRITE_WAIT</b> — During DMA Write transfers, the state machine waits in this state until the AHB master completes the write to the AHB memory space.</p> <p>0x1D <b>HALT_AFTER_TERM</b> — If HALTONTERMINATE is set and a terminate signal is set, the state machine enters this state and effectively halts. A channel reset is required to exit this state</p> <p>0x1E <b>CHECK_WAIT</b> — If the Chain bit is a 0, the state machine enters this state and effectively halts.</p> <p>0x1F <b>WAIT_READY</b> — When the NAND Wait for Ready bit is set, the state machine enters this state until the GPMI device indicates that the external device is ready.</p>

### 15.5.14 AHB to APBH DMA Channel n Debug Information (APBH\_CHn\_DEBUG2)

This register gives debug visibility for the APB and AHB byte counts for DMA Channel n.

This register allows debug visibility of the APBH DMA Channel n.

Address: 180\_4000h base + 160h offset + (112d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	APB_BYTES															AHB_BYTES																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

**APBH\_CHn\_DEBUG2 field descriptions**

Field	Description
31–16 APB_BYTES	This value reflects the current number of APB bytes remaining to be transferred in the current transfer.
AHB_BYTES	This value reflects the current number of AHB bytes remaining to be transferred in the current transfer.

### 15.5.15 APBH Bridge Version Register (APBH\_VERSION)

This register always returns a known read value for debug purposes it indicates the version of the block.

This register indicates the RTL version in use.

#### EXAMPLE

```
if (APBH_VERSION.B.MAJOR != 3)
    Error();
```

Address: 180\_4000h base + 800h offset = 180\_4800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MAJOR								MINOR								STEP															
W																																
Reset	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

#### APBH\_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

# **Chapter 16**

## **Asynchronous Sample Rate Converter (ASRC)**

### **16.1 Overview**

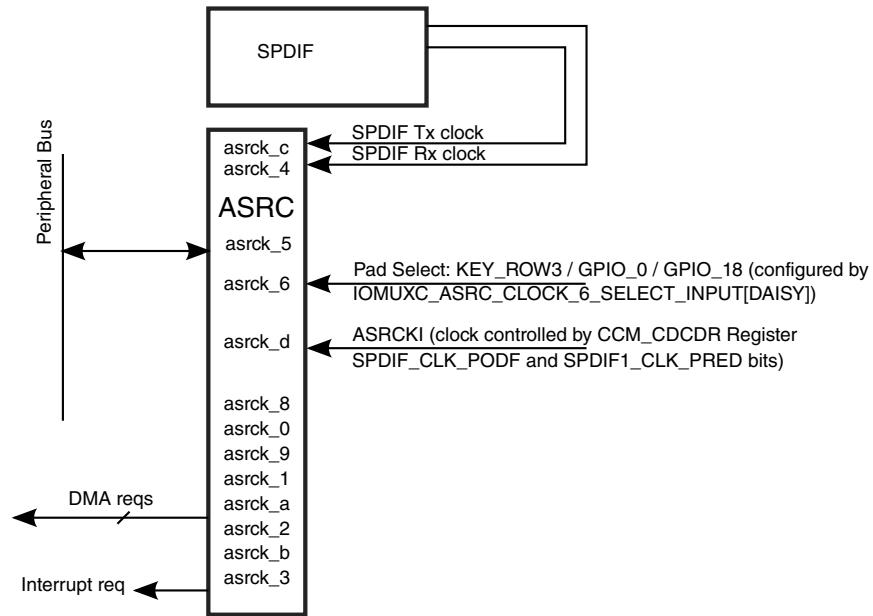

The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated with an input clock into a signal associated with a different output clock.

The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The ASRC supports up to three sampling rate pairs.

The incoming audio data to this chip may be received from various sources at different sampling rates. The outgoing audio data of this chip may have different sampling rates and it can also be associated with output clocks that are asynchronous to the input clocks.

The ASRC is implemented as a co-processor in hardware, with minimal ARM Platform intervention required.

The following figure is a system view of the connection between the ASRC block and other blocks.

**Figure 16-1. General System Overview**

The following figure is the ASRC block diagram.

The red dotted line designates the ASRC block. Objects outside the dotted line represent SoC-level resources.

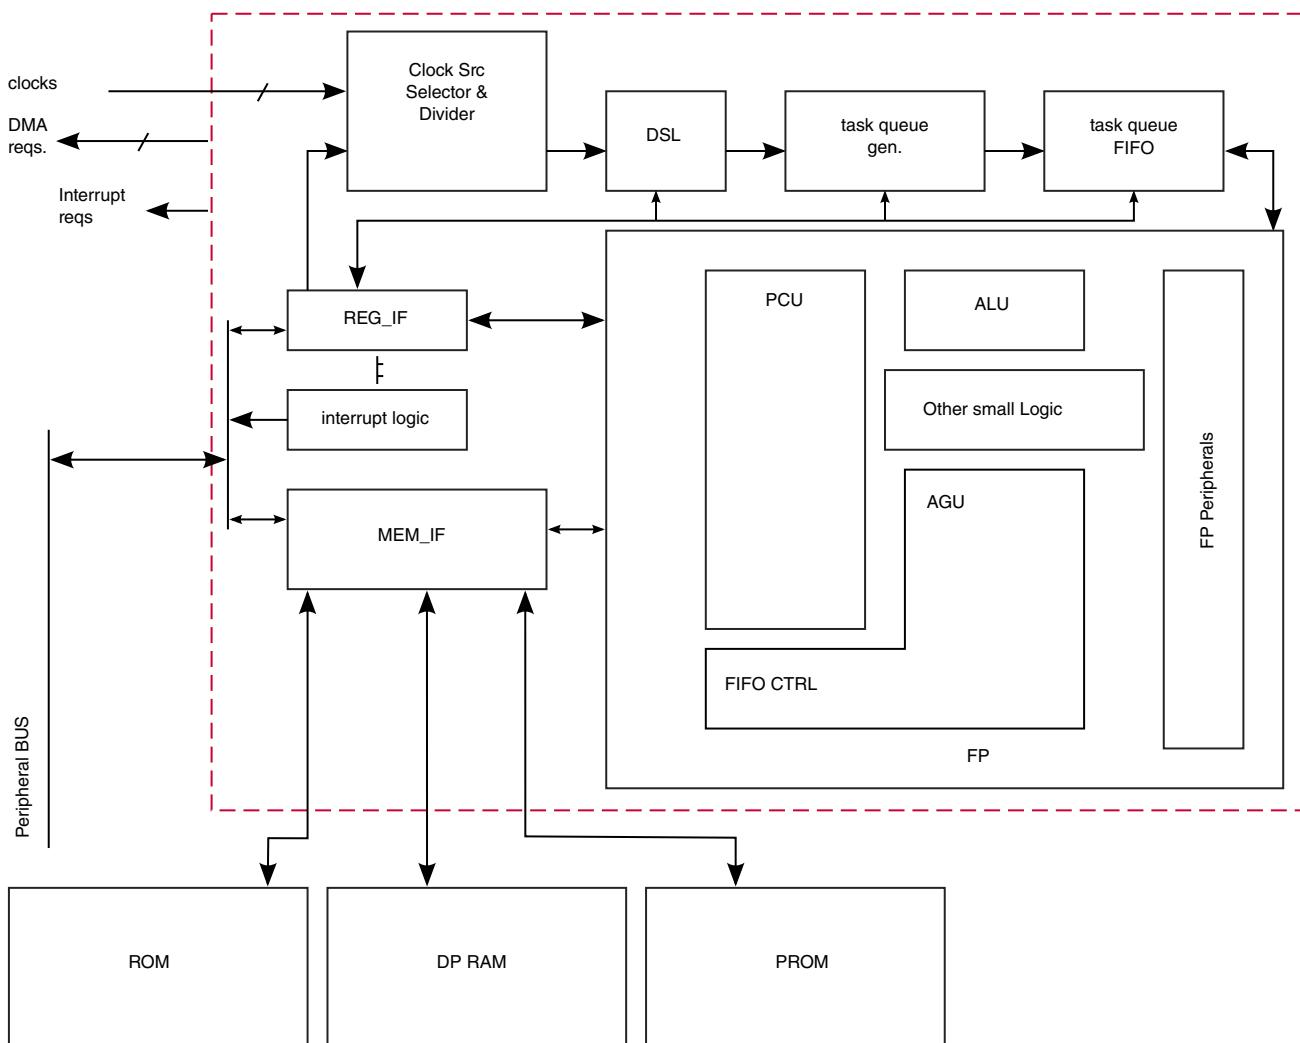

Figure 16-2. ASRC block diagram

### 16.1.1 Features

Table 16-1. ASRC Specifications

Parameters	Test Conditions	Minimum	Typical	Maximum	Unit
Channels Supported		0 <sup>1</sup>	n (0-10)	10	
Pairs of Rate Conversion		1	-	3	
THD+N	120 MHz < $F_{s_{ASRC}}$ <sup>2</sup> < 160 MHz		-120		dB
Dynamic Range				144	dB
Settling Time			40		ms
Comment:					

- When a pair has zero channels, the pair will be disabled, although the pair enable bit may be set in ASRCTR register.
- $F_{s_{ASRC}}$  is the processing clock of ASRC block.

## Other Features:

- Any number (0-10) of contiguous channels can be associated to one of the sampling rate pairs.
- Support user-programmable threshold for the input/output FIFOs.
- Support flexible 8/16/24-bit width of input data, and 16/24-bit width of output data.
- Designed for rate conversion between 44.1 kHz, 32 kHz, 48 kHz, 96 kHz, and 192 kHz. The useful signal bandwidth is below 24 kHz.
- Other input sampling rates in the range of 8 kHz to 200 kHz is also supported, but possibly with less desirable bandwidth.
- Other output sampling rates in the range of 30 kHz to 200 kHz is also supported, but possibly with less desirable bandwidth.
- Automatic accommodation to slow variations in the incoming and outgoing sampling rates.
- Linear phase
- Tolerant to sample clock jitter

## Clock/Data Connections

- The sampling rate clocks are directly connected to the ASRC block, the ratio estimation of the input clocks with output clocks are done in ASRC hardware when both input/output sampling clocks are physically available.
- When both the input sampling clock and the output sampling clock are physically available, the rate conversion can work by configuring the physical clocks.
- When the input sampling clock is not physically available, the rate conversion can still work by setting ideal-ratio values into ASRC interface registers.
- The clock signals come from the following blocks:
  - Receiving bit clock and transmitting bit clock
  - SPDIF, receiving bit clock and transmitting bit clock
  - other audio peripherals etc.
- The exchange of audio data is done by the processor accessing ASRC block through registers defined on shared peripheral bus.

### 16.1.2 Modes of Operation

See [ASRC Memory Map/Register Definition](#) for a definition of the registers and parameters used in ASRC.

#### 16.1.2.1 Data Transfer Schemes

### 16.1.2.1.1 Data Input Modes

The input mode for each of the three channel sets may be set independently. Three modes of supplying data to the ASRC input FIFOs are available:

- Polling
- Interrupt
- DMA

In all input-data transfer schemes, the ASRC fetches data from each enabled FIFO and processes the data sample-by-sample after each rising edge of the associated input sampling clock until the FIFO level reaches a threshold.

After the threshold is reached, the ASRC requests data. The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCR<sub>x</sub>, x=A, B or C.

If the ASRC attempts to fetch data from an empty FIFO, an error is generated and the ASRSTR\_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER\_AOLIE bit is set), an interrupt is generated.

When writing data to an input FIFO, you must ensure that it is in a predefined sequence. For example, when writing to an input FIFO, the sequence should be: channel\_0, channel\_1, channel\_2,..., channel\_n, channel\_0, channel\_1, channel\_2, etc. Here channel\_n stands for the data intended for the n-th channel. The hardware will re-allocate each data to its corresponding channel FIFO. The channel being re-allocated is shown by ASRCCR\_AC<sub>I</sub>x, x=A,B or C.

#### Mode 1 (Polling Mode)

Polling mode is the default mode following power-on or individual reset, and is selected by clearing the associated channel set A, B, or C data-input interrupt enable bit (ASRIER\_ADIEx, where x=A, B or C). In this mode, data-input interrupts are disabled. When the FIFO level is below the threshold, the associated status bit (ASRSTR\_AIDEx, where x=A, B, or C) is set. To clear the status bit, the FIFO must be written with enough data to raise the level above the threshold.

#### Mode 2 (Interrupt Mode)

The ASRC input FIFOs can also be serviced by interrupts. To enable interrupts, the corresponding data-input interrupt enable bits (ASRIER\_ADIEx, where x=A, B, or C) should be set. An interrupt is automatically generated any time the input FIFO level is below the threshold. The interrupt is cleared when enough data is written to the FIFO to raise the level above the threshold.

#### Mode 3 (DMA Mode)

The ASRC input FIFOs can also be filled using DMA. In this mode, the data-input interrupt-enable bits (ASRIER\_ADIEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

### **16.1.2.1.2 Data Output Modes**

The output mode for each of the 3 channel sets (A, B, and C) may be set independently.

Three modes of retrieving data from the ASRC output FIFOs are available:

- Polling
- Interrupt
- DMA

In all output-data transfer schemes, the ASRC places a processed sample into the associated output FIFO. After a threshold is reached, the ASRC requests that data be transferred out of the FIFO.

The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCRx, x=A, B or C.

If the ASRC attempts to place data into a FIFO that is already full, an error is generated and the ASRSTR\_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER\_AOLIE bit is set), an interrupt is generated.

Each output FIFO is organized in the same channel order in which the associated input FIFO was written.

Three transfer modes are supported by Interface Block.

#### **Mode 1 (Polling Mode)**

The ASRC output FIFOs can be serviced by polling. In this mode, ensure the associated output-data interrupt enable bit (ASRIER\_ADOEx, where x=A, B, or C) is cleared. In this mode, all output-data interrupts are disabled. Any time the output FIFO exceeds the threshold the associated status bit (ASRSTR\_AODFx, where x=A, B, or C) is set. To clear the status bit, enough data must be read from the associated output FIFO to lower the level below the threshold.

#### **Mode 2 (Interrupt Mode)**

The ASRC output FIFOs may also be serviced using interrupts. To enable this mode, the corresponding output-data interrupt-enable bits (ASRIER\_ADOEx, where x=A, B, or C) should be set. Any time the output FIFO level exceeds the threshold, an interrupt is automatically generated. The interrupt is cleared when enough data is read from the FIFO to lower the level below the threshold.

#### **Mode 3 (DMA Mode)**

The ASRC output FIFOs can also be read using DMA. In this mode, the output-data interrupt-enable bits (ASRIER\_ADOEx, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

## 16.1.2.2 Word Alignment Supported

### 16.1.2.2.1 Input Data Alignment Modes

The position and length of input data word to the input data FIFOs ASRDIA, ASRDIB, ASRDIC are programmable. The control bits are defined in ASRMCR1x {x=A, B, or C}. It supports the following modes.

**Table 16-2. Input Data Alignment**

Format	Bit Number																																		
	3 1	3 0	2 9	2 8	2 7	2 6	2 5	2 4	2 3	2 2	2 1	2 0	1 9	1 8	1 7	1 6	1 5	1 4	1 3	1 2	1 1	1 0	9 1	8 0	7 1	6 0	5 1	4 0	3 1	2 0	1 1	0 0

### 16.1.2.2.2 Output Data Alignment Modes

The position and length of output data word from the output data FIFOs ASRDOA, ASRDOB, ASRDOC are programmable. The control bits are defined in ASRMCR1x {x=A, B, or C}. It supports the following modes.

**Table 16-3. Output Data Alignment**

Format	Bit Number																																	
	3 1	3 0	2 9	2 8	2 7	2 6	2 5	2 4	2 3	2 2	2 1	2 0	1 9	1 8	1 7	1 6	1 5	1 4	1 3	1 2	1 1	1 0	9 1	8 0	7 1	6 0	5 1	4 0	3 1	2 0	1 1	0 0

## 16.2 Clocks

The table found here describes the clock sources for ASRC.

Please see clock control block for clock setting, configuration and gating information.

**Table 16-4. ASRC Clocks**

Clock name	Clock Root	Description
asrck_clock_d	spdif1_clk_root	ASRC module clock (SPDIF clock)
ipg_clk	ahb_clk_root	Peripheral clock
mem_clk	ahb_clk_root	Peripheral access clock

## 16.3 Interrupts

ASRC has several interrupt events.

The priorities are shown in the following table.

**Table 16-5. Interrupt Priorities/Vector**

Priority	Offset	Description
lowest	0x0	ASRC Pair A input data needed
	0x2	ASRC Pair B input data needed

*Table continues on the next page...*

**Table 16-5. Interrupt Priorities/Vector (continued)**

Priority	Offset	Description
	0x4	ASRC Pair C input data needed
	0x6	ASRC Pair A output data ready
	0x8	ASRC Pair B output data ready
	0xA	ASRC Pair C output data ready
highest	0xC	ASRC Overload

## 16.4 DMA requests

ASRC has six DMA requests. They are directly connected to the lowest six status bits in the ASRSTR register. For some ARM platforms, the six status bits are directly connected to SDMA or HDMA as DMA event signals.

**Table 16-6. DMA requests**

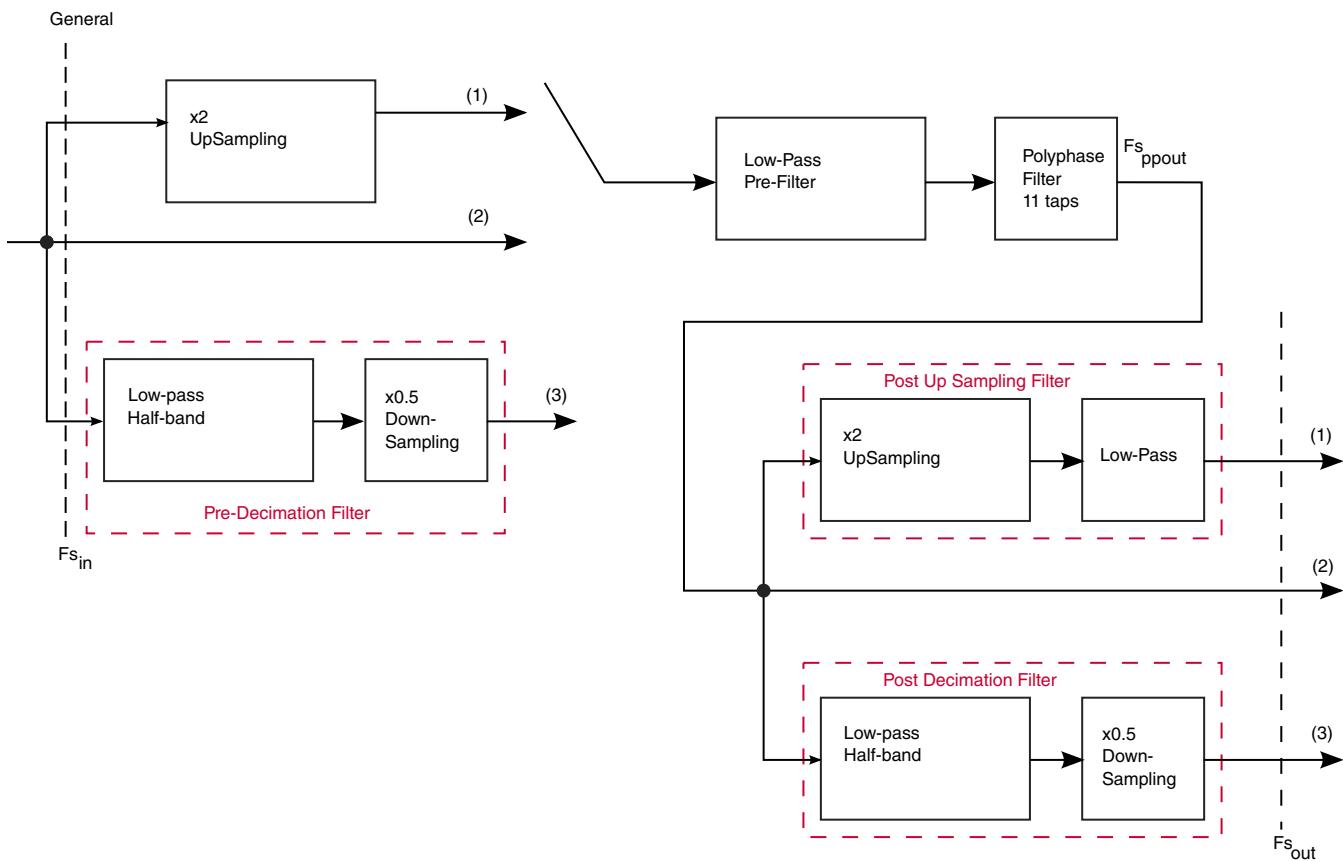

Type	Description
0	ASRC Pair A input data needed
1	ASRC Pair B input data needed
2	ASRC Pair C input data needed
3	ASRC Pair A output data ready
4	ASRC Pair B output data ready
5	ASRC Pair C output data ready

## 16.5 Functional Description

This section provides a complete functional description of the block.

### 16.5.1 Algorithm Description

### 16.5.1.1 Signal processing flow

**Figure 16-3. Signal processing configurations**

The figure above shows the possible configurations of the ASRC. Each configuration consists of 2 to 4 stages.

- x2 up-sampling rate expander (zero insertion only) (input branch 1), direct connection (input branch 2), or low-pass pre decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (input branch 3),
- low-pass pre-filter, the low-pass bandwidth is at most  $0.25 \times F_s$ , where  $F_s$  is the sampling rate of the input signal to this low-pass pre-filter,
- polyphase filter,
- x2 post upsampling filter (consisting of a x2 up-sampling rate expander (zero insertion only) with low-pass half-band FIR filter) (output branch 1), direct connection (output branch 2), or low-pass post decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (output branch 3).

By flowing through different processing branches and different setups of the pre-filter, this ASRC scheme can be used to handle different rate conversion requirements.

- Configuration (a): Input Branch 1+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/2$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = Fs_{out}/2$ .

- Configuration (b): Input Branch 1+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/2$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = Fs_{out}$ .

- Configuration (c): Input Branch 1+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/2$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = 2Fs_{out}$ .

- Configuration (d): Input Branch 2+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/4$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = Fs_{out}/2$ .

- Configuration (e): Input Branch 2+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/4$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = Fs_{out}$ .

- Configuration (f): Input Branch 2+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/4$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = 2Fs_{out}$ .

- Configuration (g): Input Branch 3+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/8$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = Fs_{out}/2$ .

- Configuration (h): Input Branch 3+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/8$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = Fs_{out}$ .

- Configuration (i): Input Branch 3+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most  $BW_{in} = Fs_{in}/8$ .  
 The signal sampling rate of the polyphase filter output is  $Fs_{ppout} = 2Fs_{out}$ .

**Table 16-7. Pre-processing, post-processing options**

{Pre_Proc, Post_Proc}	Fsout (KHz)											
	8	12	16	24	32	44.1	48	64	88.2	96	128	192
Fsin (KHz)	8	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	12	{0,2}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	16	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	24	{1,2}	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}
	32	{1,2}	{1,2}	{1,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}
	44.1	{2,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}
	48	{2,2}	{1,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	64	{2,2}	{2,2}	{1,2}	{1,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	88.2	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	96	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	128	NA	NA	{2,2}	{2,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	192	NA	NA	NA	{2,2}	{2,2}	{2,2}	{2,1}	{2,1}	{2,1}	{2,1}	{2,1}

**NOTE:** In the {Pre\_Proc, Post\_Proc} pair, the meaning of the values are:

Pre\_Proc:

- 0 --- Pre-processing Branch 1 as shown in [Figure 16-3](#)
- 1 --- Pre-processing Branch 2 as shown in [Figure 16-3](#)
- 2 --- Pre-processing Branch 3 as shown in [Figure 16-3](#), decimation-by-2

Post\_Proc:

- 0 --- Post-processing Branch 1 as shown in [Figure 16-3](#)
- 1 --- Post-processing Branch 2 as shown in [Figure 16-3](#)
- 2 --- Post-processing Branch 3 as shown in [Figure 16-3](#)

The latencies of the different option can be roughly calculated as follows:

- For PreProc = 0, PostProc = 1 : min latency = constant\_A / input-sample-rate + constant\_B / output-sample-rate
- For PreProc = 0, PostProc = 0 : min latency = constant\_A / input-sample-rate + constant\_C / output-sample-rate
- For PreProc = 1, PostProc = 1 : min latency = constant\_D / input-sample-rate + constant\_B / output-sample-rate

The constants above (e.g., constant\_A means the Constant for Preproc = 0, constant\_B means the Constant for Postproc = 1, ...) are only influenced by the PreProc/PostProc and (input/output) sampling rate to which they are connected. Input latencies have no relationship with the output latencies, but both elements add together to form the total latencies.

For a rough estimation, the constants can be set as:

- Constant for Preproc = 0: 39

- Constant for Preproc = 1: 78.5
- Constant for Preproc = 2: 235
- Constant for Postproc = 0: 42.5
- Constant for Postproc = 1: 8.5
- Constant for Postproc = 2: 172

The max latency can be derived from this value by using the following formula (where 32 means the input/output FIFO depth that will arouse data transfer):

- max latency = min latency + 32 / input-sample-rate + 32 / output-sample-rate

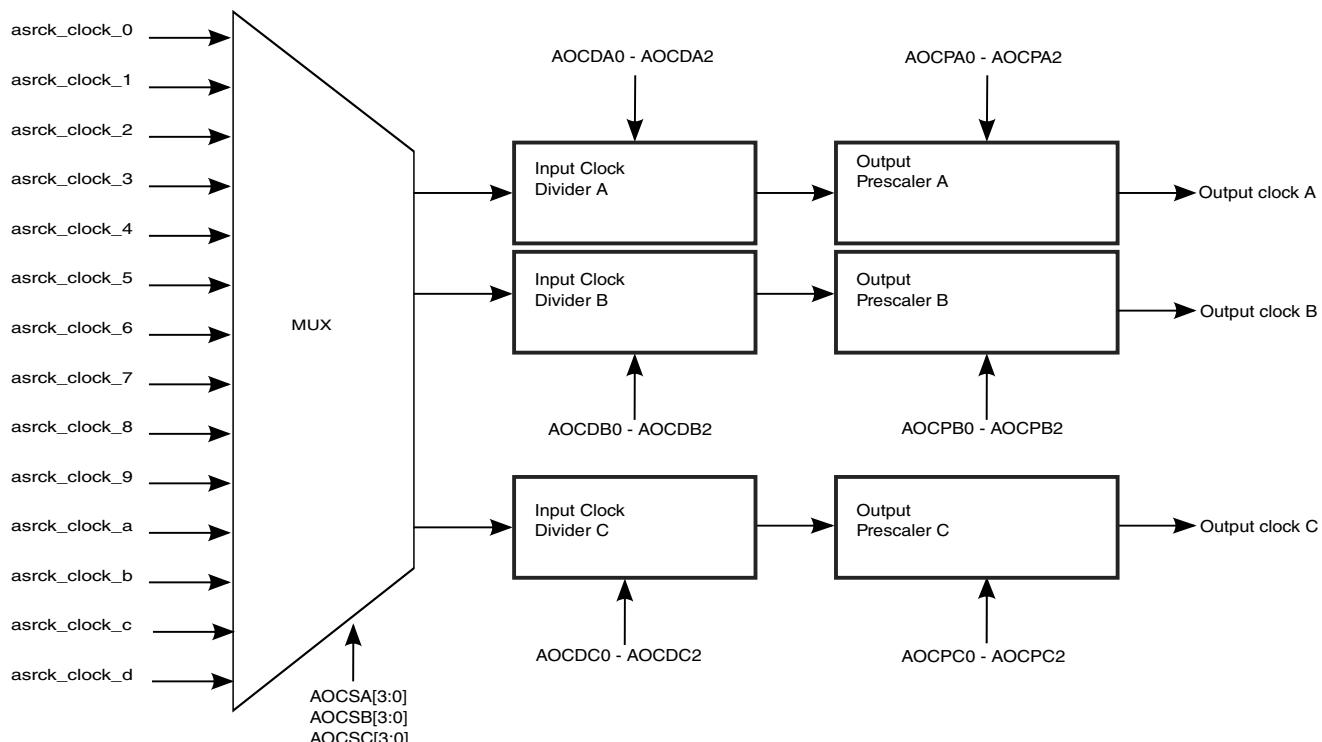

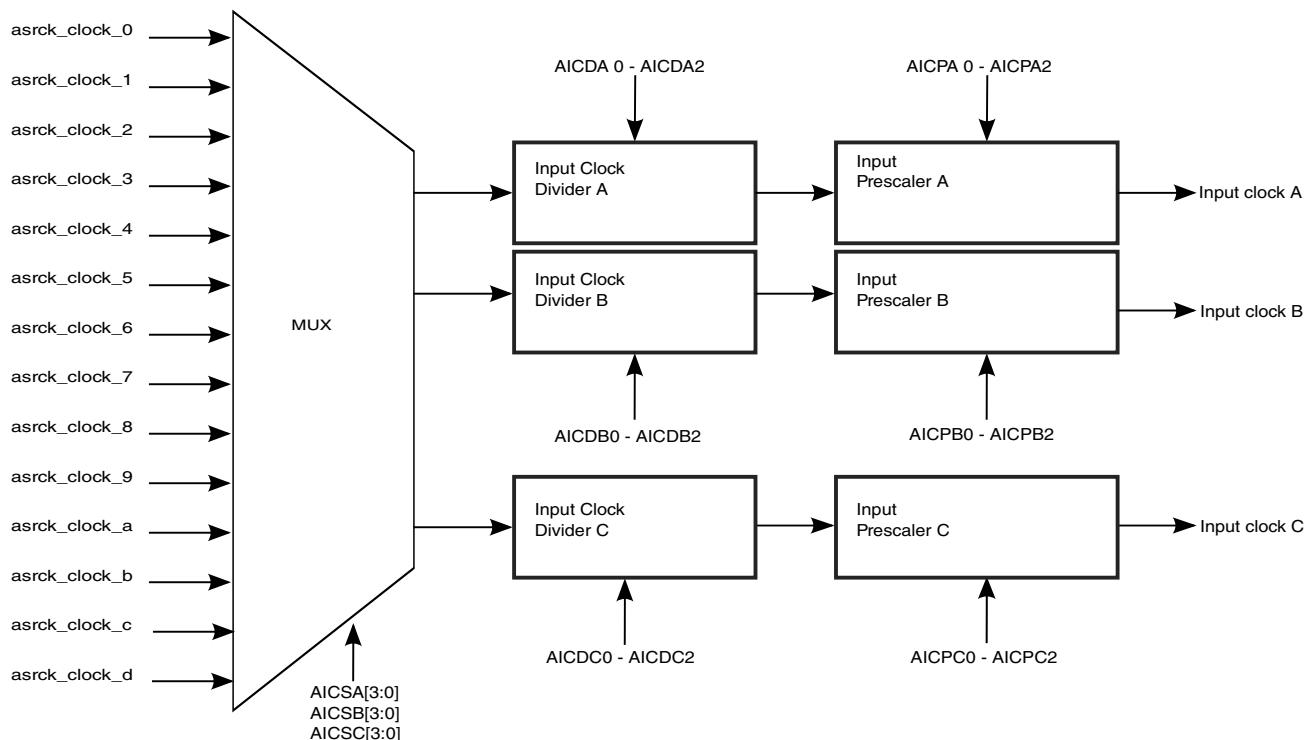

## 16.5.1.2 Operation of the Filter

### 16.5.1.2.1 Support of Physical Clocks

This design supports physical sampling clocks. The clocks can be provided by:

- Sony/Phillips digital interface (SPDIF)
- Serial Audio Interface (SAI)
- Core master clock derivative as ASRCK1

## Functional Description

**Figure 16-4. Clock Source Selector and Divider**

Software can set the ASRC Clock Source Register (ASRCSR) and the Clock Divider Register to select the desired clock source and divide it to the needed sample rate clock for use by the ASRC. The clocks have the following restriction. If the prescaler is set to 1, the clock divider can only be set to 1 and the clock source must have a 50% duty cycle.

## 16.6 Startup Procedure

The following example shows the normal setup procedure for the ASRC block.

```
#include "asrc_common.h"
#include "stdio.h"
#include "soc_api.h"

int incnt=0;
int outcnt=0;

#include "wy_ideal_ratio_dataini_part.h"

WORD    IdealRatio_High=0x04; //
WORD    IdealRatio_Low=0x0; //

void asrc_config_alloc(WORD ASRCTR_VAL, WORD ASRIER_VAL, WORD ASRCNCR_VAL,
                      WORD ASRCFG_VAL, WORD ASRCDR1_VAL, WORD ASRCDR2_VAL,
                      WORD ASRCSR_VAL)

{
    // Disable ASRC

    reg32_write(ASRC_ASRCTR, 0x0);

    reg32_write(ASRC_ASRCTR, ASRCTR_VAL);

    reg32_write(ASRC_ASRIER, ASRIER_VAL);

    reg32_write(ASRC_ASRIEM, 0x0);

    reg32_write(ASRC_ASRCNCR, ASRCNCR_VAL);

## 16.7 ASRC Memory Map/Register Definition

All useful registers are listed in the memory map below. The access of undefined registers will behave as normal registers.

All the interface registers are LSB aligned except the input FIFOs and the output FIFOs, and each register has only 24 effective bits.

The input FIFO and output FIFO word alignment can be defined using ASRMCR1{A,B,C} registers in 32-bit interface system.

**ASRC\_ASRCTR field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved
23 -	This field is reserved. Reserved. Should be written as zero for compatibility.
22 ATSC	ASRC Pair C Automatic Selection For Processing Options  When this bit is 1, pair C will automatic update its pre-processing and post-processing options (ASRCFG:PREMODC, ASRCFG:POSTMODC see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> and <a href="#">ASRC Misc Control Register 1 for Pair C</a> ).  When this bit is 0, the user is responsible for choosing the proper processing options for pair C.  This bit should be disabled when {USRC, IDRCC}={1,1}.
21 ATSB	ASRC Pair B Automatic Selection For Processing Options  When this bit is 1, pair B will automatic update its pre-processing and post-processing options (ASRCFG:PREMODB, ASRCFG:POSTMODB see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> and <a href="#">ASRC Misc Control Register 1 for Pair C</a> ).  When this bit is 0, the user is responsible for choosing the proper processing options for pair B.  This bit should be disabled when {USRB, IDRDB}={1,1}.
20 ATSA	ASRC Pair A Automatic Selection For Processing Options  When this bit is 1, pair A will automatic update its pre-processing and post-processing options (ASRCFG:PREMODA, ASRCFG:POSTMODA see <a href="#">ASRC Misc Control Register 1 for Pair C</a> ) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see <a href="#">ASRC Misc Control Register 1 for Pair C</a> and <a href="#">ASRC Misc Control Register 1 for Pair C</a> ).  When this bit is 0, the user is responsible for choosing the proper processing options for pair A.  This bit should be disabled when {USRA, IDRDA}={1,1}.
19 -	This field is reserved. Reserved. Should be written as zero for compatibility.
18 USRC	Use Ratio for Pair C  Use ratio as the input to ASRC. This bit is used in conjunction with IDRCC control bit.
17 IDRC	Use Ideal Ratio for Pair C  When USRC=0, this bit has no usage.  When USRC=1 and IDRC=0, ASRC internal measured ratio will be used.  When USRC=1 and IDRC=1, the idea ratio from the interface register ASRIDRHC, ASRIDRLC will be used. It is suggested to manually set ASRCFG:POSTMODC, ASRCFG:PREMODC according to <a href="#">Table 16-7</a> in this case.
16 USRB	Use Ratio for Pair B  Use ratio as the input to ASRC. This bit is used in conjunction with IDRDB control bit.
15 IDRB	Use Ideal Ratio for Pair B  When USRB=0, this bit has no usage.  When USRB=1 and IDRB=0, ASRC internal measured ratio will be used.  When USRB=1 and IDRB=1, the idea ratio from the interface register ASRIDRHB, ASRIDRLB will be used. It is suggested to manually set ASRCFG:POSTMODB, ASRCFG:PREMODB according to <a href="#">Table 16-7</a> in this case.

*Table continues on the next page...*

**ASRC\_ASRCTR field descriptions (continued)**

Field	Description
14 USRA	Use Ratio for Pair A  Use ratio as the input to ASRC. This bit is used in conjunction with IDRA control bit.
13 IDRA	Use Ideal Ratio for Pair A  When USRA=0, this bit has no usage.  When USRA=1 and IDRA=0, ASRC internal measured ratio will be used.  When USRA=1 and IDRA=1, the idea ratio from the interface register ASRIDRHA, ASRIDRLA will be used. It is suggested to manually set ASRCFG:POSTMODA, ASRCFG:PREMODA according to <a href="#">Table 16-7</a> in this case.
12–5 -	This field is reserved.  Reserved. Should be written as zero for compatibility.
4 SRST	Software Reset  This bit is self-clear bit. Once it is been written as 1, it will generate a software reset signal inside ASRC. After 9 cycles of the ASRC processing clock, this reset process will stop, and this bit will be cleared automatically.
3 ASREC	ASRC Enable C  Enable the operation of the conversion C of ASRC. When ASREC is cleared, operation of conversion C is disabled.
2 ASREB	ASRC Enable B  Enable the operation of the conversion B of ASRC. When ASREB is cleared, operation of conversion B is disabled.
1 ASREA	ASRC Enable A  Enable the operation of the conversion A of ASRC. When ASREA is cleared, operation of conversion A is disabled.
0 ASRCEN	ASRC Enable  Enable the operation of ASRC.

## 16.7.2 ASRC Interrupt Enable Register (ASRC\_ASRIER)

Address: 203\_4000h base + 4h offset = 203\_4004h

### 16.7.3 ASRC Channel Number Configuration Register (ASRC\_ASRCNCR)

The ASRC channel number configuration register (ASRCNCR) is a read/write register that sets the number of channels used by each ASRC conversion pair.

There are 10 channels available for distribution among 3 conversion pairs, they are ordered as 0,1,...,9. The bottom [0, ANCA-1] channels are used for pair A, the top [10-ANCC, 9] channels are used for pair C, and the [ANCA, ANCA+ANCB-1] channels are allocated for pair B. In case that ANCA=0, then the [0, ANCB-1] channels are assigned for pair B.

Address: 203\_4000h base + Ch offset = 203\_400Ch

### 16.7.6 ASRC Clock Divider Register 1 (ASRC\_ASRCDR1)

The ASRC clock divider register (ASRCDR1) is a read/write register that controls the division factors of the ASRC input and output clock sources.

Address: 203 4000h base + 18h offset = 203 4018h

## ASRC ASRCDR1 field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–21 AOCDB	Output Clock Divider B  Specify the divide ratio of the output clock divider B. The divide ratio may range from 1 to 8 (AOCDB[2:0] = 000 to 111).
20–18 AOCPB	Output Clock Prescaler B  Specify the prescaling factor of the output prescaler B. The prescaling ratio may be any power of 2 from 1 to 128.
17–15 AOCDA	Output Clock Divider A  Specify the divide ratio of the output clock divider A. The divide ratio may range from 1 to 8 (AOCDA[2:0] = 000 to 111).
14–12 AOCPA	Output Clock Prescaler A  Specify the prescaling factor of the output prescaler A. The prescaling ratio may be any power of 2 from 1 to 128.
11–9 AICDB	Input Clock Divider B  Specify the divide ratio of the input clock divider B. The divide ratio may range from 1 to 8 (AICDB[2:0] = 000 to 111).

*Table continues on the next page...*

**ASRC\_ASRCDR1 field descriptions (continued)**

Field	Description
8–6 AICPB	Input Clock Prescaler B Specify the prescaling factor of the input prescaler B. The prescaling ratio may be any power of 2 from 1 to 128.
5–3 AICDA	Input Clock Divider A Specify the divide ratio of the input clock divider A. The divide ratio may range from 1 to 8 (AICDA[2:0] = 000 to 111).
AICPA	Input Clock Prescaler A Specify the prescaling factor of the input prescaler A. The prescaling ratio may be any power of 2 from 1 to 128.

**16.7.7 ASRC Clock Divider Register 2 (ASRC\_ASRCDR2)**

The ASRC clock divider register (ASRCDR2) is a read/write register that controls the division factors of the ASRC input and output clock sources.

Address: 203\_4000h base + 1Ch offset = 203\_401Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
	The bit is cleared when writing ASRSTR:AOLE as 1.
11 AODOA	<p>Output Data Buffer A has overflowed</p> <p>When set, this bit indicates that output data buffer A has overflowed. When clear, this bit indicates that output data buffer A has not overflowed</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
10 AIDUC	<p>Input Data Buffer C has underflowed</p> <p>When set, this bit indicates that input data buffer C has underflowed.</p> <p>When clear, this bit indicates that input data buffer C has not underflowed.</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
9 AIDUB	<p>Input Data Buffer B has underflowed</p> <p>When set, this bit indicates that input data buffer B has underflowed.</p> <p>When clear, this bit indicates that input data buffer B has not underflowed.</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
8 AIDUA	<p>Input Data Buffer A has underflowed</p> <p>When set, this bit indicates that input data buffer A has underflowed.</p> <p>When clear, this bit indicates that input data buffer A has not underflowed.</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
7 FPWT	<p>FP is in wait states</p> <p>This bit is for debug only.</p> <p>When set, this bit indicates that ASRC is in wait states.</p> <p>When clear, this bit indicates that ASRC is not in wait states.</p>
6 AOLE	<p>Overload Error Flag</p> <p>When set, this bit indicates that the task rate is too high for the ASRC to handle. The reasons for overload may be:</p> <ul style="list-style-type: none"> <li>- too high input clock frequency,</li> <li>- too high output clock frequency,</li> <li>- incorrect selection of the pre-filter,</li> <li>- low ASRC processing clock,</li> <li>- too many channels,</li> <li>- underrun,</li> <li>- or any combination of the reasons above.</li> </ul> <p>Since the ASRC uses the same hardware resources to perform various tasks, the real reason for the overload is not straight forward, and it should be carefully analyzed by the programmer.</p> <p>If ASRIER:AOLIE=1, an interrupt will be proposed when this bit is set.</p> <p>Write any value with this bit set as one into the status register will clear this bit and the interrupt request proposed by this bit.</p>
5 AODFC	Number of data in Output Data Buffer C is greater than threshold

*Table continues on the next page...*

**ASRC\_ASRSTR field descriptions (continued)**

Field	Description
	When set, this bit indicates that number of data already existing in ASRDORC is greater than threshold and the processor can read data from ASRDORC. When AODFC is set, the ASRC generates data output C interrupt request to the processor, if enabled (that is, ASRIER:ADOEC = 1). A DMA request is always generated when the AODFC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
4 AODFB	Number of data in Output Data Buffer B is greater than threshold  When set, this bit indicates that number of data already existing in ASRDORB is greater than threshold and the processor can read data from ASRDORB. When AODFB is set, the ASRC generates data output B interrupt request to the processor, if enabled (that is, ASRIER:ADOEB = 1). A DMA request is always generated when the AODFB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
3 AODFA	Number of data in Output Data Buffer A is greater than threshold  When set, this bit indicates that number of data already existing in ASRDORA is greater than threshold and the processor can read data from ASRDORA. When AODFA is set, the ASRC generates data output A interrupt request to the processor, if enabled (that is, ASRIER:ADOEA = 1). A DMA request is always generated when the AODFA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
2 AIDEC	Number of data in Input Data Buffer C is less than threshold  When set, this bit indicates that number of data still available in ASRDIRC is less than threshold and the processor can write data to ASRDIRC. When AIDEC is set, the ASRC generates data input C interrupt request to the processor, if enabled (that is, ASRIER:ADIEC = 1). A DMA request is always generated when the AIDEC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
1 AIDEB	Number of data in Input Data Buffer B is less than threshold  When set, this bit indicates that number of data still available in ASRDIRB is less than threshold and the processor can write data to ASRDIRB. When AIDEB is set, the ASRC generates data input B interrupt request to the processor, if enabled (that is, ASRIER:ADIEB = 1). A DMA request is always generated when the AIDEB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
0 AIDEA	Number of data in Input Data Buffer A is less than threshold  When set, this bit indicates that number of data still available in ASRDIRA is less than threshold and the processor can write data to ASRDIRA. When AIDEA is set, the ASRC generates data input A interrupt request to the processor, if enabled (that is, ASRIER:ADIEA = 1). A DMA request is always generated when the AIDEA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.

**16.7.9 ASRC Parameter Register n (ASRC\_ASRPMnn)**

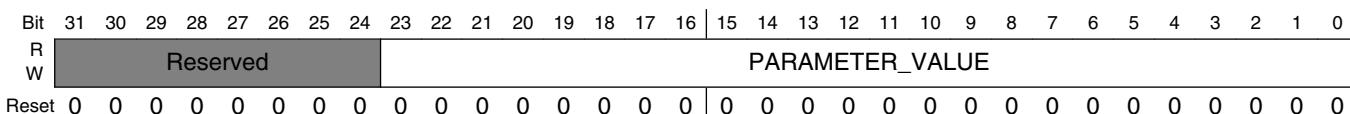

Parameter registers determine the performance of ASRC.

The parameter registers must be initialized by software before ASRC is enabled.  
Recommended values are given in [ASRC Misc Control Register 1 for Pair C](#) below,

**Table 16-8. ASRC Parameter Registers (ASRPM1~ASRPM5)**

Register	Offset	Access	Reset Value	Recommend Value
asrcpm1	0x40	R/W	0x00_0000	0x7fffff
asrcpm2	0x44	R/W	0x00_0000	0x255555
asrcpm3	0x48	R/W	0x00_0000	0xff7280
asrcpm4	0x4C	R/W	0x00_0000	0xff7280
asrcpm5	0x50	R/W	0x00_0000	0xff7280

Address: 203\_4000h base + 40h offset + (4d × i), where i=0d to 4d

### 16.7.10 ASRC ASRC Task Queue FIFO Register 1 (ASRC\_ASRTFR1)

The register defines and shows the parameters for ASRC inner task queue FIFOs.

Address: 203\_4000h base + 54h offset = 203\_4054h

#### ASRC\_ASRTFR1 field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–20 -	This field is reserved. Reserved. Should be written as zero for compatibility.
19–13 TF_FILL	Current number of entries in task queue FIFO.

Table continues on the next page...

**ASRC\_ASRTFR1 field descriptions (continued)**

Field	Description
12–6 TF_BASE	Base address for task queue FIFO. Set to 0x7C.
-	This field is reserved. Reserved. Should be written as zero for compatibility.

**16.7.11 ASRC Channel Counter Register (ASRC\_ASRCCR)**

The ASRC channel counter register (ASRCCR) is a read/write register that sets and reflects the current specific input/output FIFO being accessed through shared peripheral bus for each ASRC conversion pair.

Address: 203\_4000h base + 5Ch offset = 203\_405Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**ASRC\_ASRM C RA field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved
23 ZEROBUFA	Initialize buf of Pair A when pair A is enabled. Always clear option. This bit is used to control whether the buffer is to be zeroized when pair A is enabled. 1 Don't zeroize the buffer 0 Zeroize the buffer
22 EXTTHRSHA	Use external thresholds for FIFO control of Pair A This bit will determine whether the FIFO thresholds externally defined in this register is used to control ASRC internal FIFO logic for pair A. 1 Use external defined thresholds. 0 Use default thresholds.
21 BUFSTALLA	Stall Pair A conversion in case of Buffer Near Empty/Full Condition This bit will determine whether the near empty/full FIFO condition will stall the rate conversion for pair A. This option can only work when external ratio is used. Near empty condition is the condition when input FIFO has less than 4 useful samples per channel. Near full condition is the condition when the output FIFO has less than 4 vacant sample words to fill per channel.

Table continues on the next page...

# Chapter 17

## 40-BIT Correcting ECC Accelerator (BCH)

### 17.1 Overview

The hardware ECC accelerator provides a forward error-correction function for improving the reliability of various storage media that may be attached to the device.

For example, NAND flash devices use a spare area to store ecc codes to correct some hard bit errors in data stored within the device, allowing higher device yields and, therefore, lower NAND device costs.

The Bose, Ray-Chaudhuri, Hocquenghem (BCH) Encoder and Decoder module is capable of correcting from 2 to 40 single bit errors within a block of data no larger than about 1900 bytes (512 bytes or 1024 bytes are typical) in applications such as protecting data and resources stored on modern NAND flash devices. The correction level in the BCH block is programmable to provide flexibility for varying applications and configurations of flash page size. The design can be programmed to encode protection of 2 to 40 bit errors when writing flash and to correct the corresponding number of errors on decode. The correction level when decoding MUST be programmed to the same correction level as was used during the encode phase.

BCH-codes are a type of block-code, which implies that all error-correction is performed over a block of N-symbols. The BCH operation will be performed over GF( $2^{13} = 8192$ ) or GF( $2^{14} = 16384$ ), which is the Galois Field consisting of 8191 or 16383 one-bit symbols. BCH-encoding (or encode for any block-code) can be performed by two algorithms: systematic encoding or multiplicative encoding. Systematic encoding is the process of reading all the symbols which constitute a block, dividing continuously these symbols by the generator polynomial for the GF(8192) or GF(16384) and appending the resulting  $t$  parity symbols to the block to create a BCH codeword (where  $t$  is the number of correctable bits).

The BCH encode process creates  $t*13$  (or  $t*14$ )-bit parity symbols for each data block when the data is written to the flash device. The parity symbols are written to the flash device after the corresponding data block, and together these are collectively called the codeword. The codeword can be used during the decode process to correct errors that occur in either the data or parity blocks.

The BCH decoder processes code words in a 4-step fashion:

1. Syndrome Calculation (SC): This is the process of reading in all of the symbols of the codeword and continuously dividing by the generator polynomial for the field.  $2*t$  syndromes must be calculated for each codeword and inspection of the syndromes determines if there are errors: a non-zero set of syndromes indicates one or more errors. This process is implemented parallel hardware to minimize processing time since it must be done every time the decode is performed.
2. Key Equation Solver (KES): The syndromes represent  $2t$ -linear equations with  $2t$ -unknown variables. The process of solving these equations and selecting from the numerous solutions constitutes the KES module. When the KES block completes its operations, it generates an error locator polynomial ( $\sigma$ ) that is used in the proceeding block to determine the locations and values of the errors.
3. Chien Search (CS): This block takes input from the KES block and uses the Chien Algorithm for finding the locations of the errors based on the error locator polynomial. The method basically involves substituting all 8191 symbols from the GF(8192) or 16383 symbols from the GF(16383) into the locator polynomial. All evaluations that produce a zero solution indicate locations of the various errors. Since each located error corresponds to a single bit, the bit in the original data may be corrected by simply flipping the polarity of the incorrect location.
4. Correction: this block has to convert the symbol index and mask information to memory byte indexes and masks.

The BCH block, shown in the figure, was designed to operate in a pipelined fashion to maximize throughput. Aside from the initial latency to fill the pipeline stages, the BCH throughput is about  $7/4$  cycles/byte. Thus, the bottleneck in performing NAND reads and error corrections is the BCH rate. Current GPMI read rates are approximately  $1/2$  cycles/byte maximally for the current generation of NAND flash. Fortunately, BCH has a different master clock from GPMI, this gives some flexibility to match the throughput rate. The CPU is not directly involved in generating parity symbols, checking for errors, or correcting them.

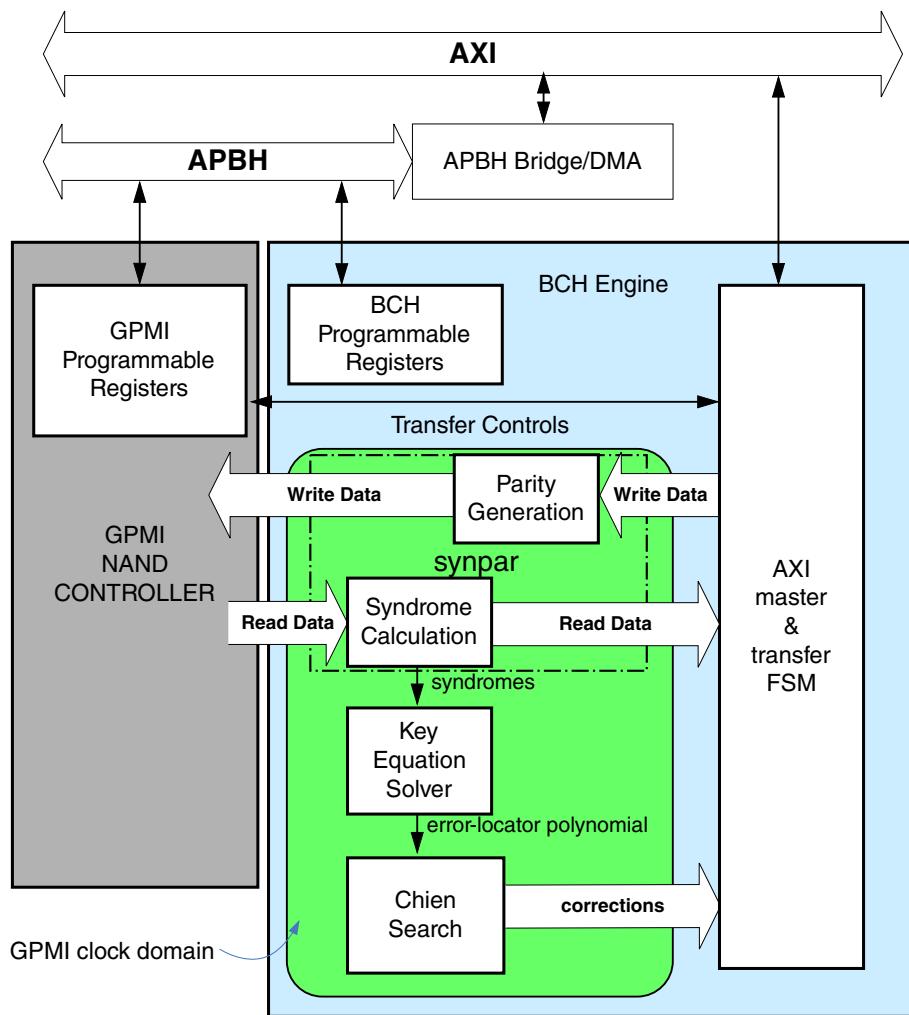

Figure 17-1. Hardware BCH Accelerator

## 17.2 Operation

Before performing any NAND flash read or write operations, software should first program the BCH's flash layout registers (see [Flash Page Layout](#)) to specify how data is to be formatted on the flash device. The BCH hardware allows full programmability over the flash page layout to enable users flexibility in balancing ECC correction levels and ever-changing flash page sizes.

To initiate a NAND Flash write, software will program a GPMI DMA operation. The DMA need only program the GPMI control registers (and handle the requisite flash addressing handshakes) since the BCH will handle all data operations using its AXI bus interface. The BCH will then send the data to the GPMI controller to be written to flash

## Operation

as it computes the parity symbols. At the end of each data block the BCH will insert the parity symbols into the data stream so that the GPMI sees only a continuous stream of data to be written.

NAND Flash read operations operate in a similar manner. As the GPMI controller reads the device, all data is sent to the BCH hardware for error detection/correction. The BCH controller writes all incoming read data to system memory and in parallel computes the syndromes used to detect bit errors. If errors are detected within a block, the BCH hardware activates the error correction logic to determine where bit errors have occurred and ultimately correct them in the data buffer in system memory. After an entire flash page has been read and corrected, the BCH will signal an interrupt to the CPU.

The figure below indicates how data read from the GPMI is operated on within the BCH hardware. As the BCH receives data from the GPMI (top row), it is written to memory by the BCH's Bus Interface Unit (BIU) (second row). For blocks requiring correction, the KES logic will be activated after the entire block has been received. Once the error locator polynomial has been computed, the corrections are determined by the Chien Search and fed back to the BIU, which performs a read, modify, write operation on the buffer in memory to correct the data.

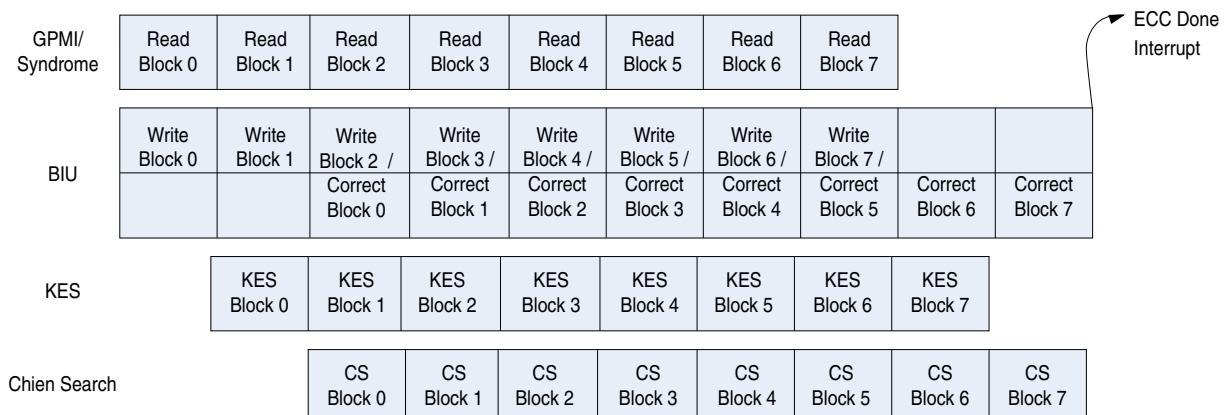

Figure 17-2. Block Pipeline while Reading Flash

### 17.2.1 BCH Limitations and Assumptions

- The BCH is programmable to support 2 to 40 bit error correction. ECC0 is supported as a pass-through, non-correcting mode.
- Data block sizes must be a multiple of 4 bytes and be aligned in system memory.
- The BCH supports a programmable number of metadata/auxiliary data bytes, from 0 to 255.

- Metadata will be written at the beginning of the flash page to facilitate fast access for filesystem operations.
- Metadata may be treated as an independent block for ECC purposes or combined with the first data block to conserve bits in the flash.
- The BCH does not support a partial page write (this can be accomplished by programming the BCH layout registers such that the BCH only sees a portion of the page).
- Flash read operations can read the entire page or the first block on the page.
- The BCH also supports a memory-to-memory mode of operation that does not require the use of DMA or the GPMI.

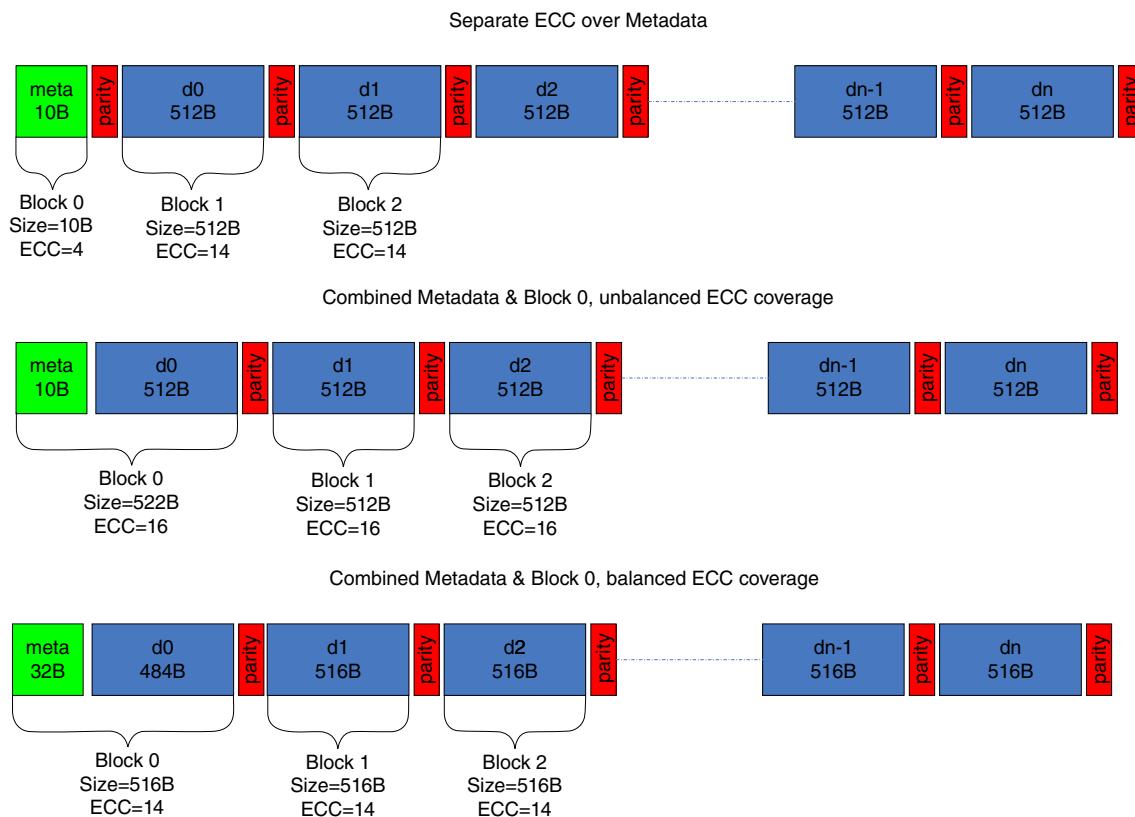

## 17.2.2 Flash Page Layout

The BCH supports a fully programmable flash page layout. The BCH maintains four independent layout registers that can describe four completely different NAND devices or layouts.

When the BCH initiates an operation, it selects one of the layouts by using the chip select as an index into the `BCH_LAYOUTSELECT` register that determines which layout should be used for the operation.

Three possible (generic) flash layout schemes are supported, as indicated in the figure below. (In each case, the metadata size may also be programmed to 0 bytes). Metadata may either be combined with the first block of data or the size of the first data block can be programmed to 0 to allow the metadata to be protected by its own ECC parity bits.

## Operation

**Figure 17-3. FLASH Page Layout Options**

Each layout is determined by a pair of registers that define the following parameters:

- DATA0\_SIZE: Indicates the number of data bytes in the first block on the page (this should not include parity or metadata bytes). This should be set to 0 when the metadata is to be covered separately with its own ECC. This must be a multiple of 4 bytes.
- ECC0: Indicates the ECC level to be used for the first block on the flash (data0+metadata).
- META\_SIZE: Indicates the number of bytes (from 0-255) that are stored as metadata.
- NBLOCKS: Indicates the number of subsequent DATAN blocks on the flash, or the number of blocks following the DATA0 block.
- DATAN\_SIZE: Indicates the number of data bytes in all subsequent data blocks. This MUST be a multiple of 4 bytes.
- ECCN: Indicates the ECC level to be used for the subsequent data blocks.

- GF0 or GFN: Indicates the Galois field the meta / data blocks are using
- PAGE\_SIZE: Indicates the total number of bytes available per page on the physical flash device. This includes the spare area and is typically 4096+128, 4096+218, or 2048+64 bytes.

### 17.2.3 Determining the ECC layout for a device

Since the BCH is programmable, a system can trade off ECC levels for flash size and layout configurations.

The following examples indicate how to determine a valid layout based on the required storage space and flash size. For all cases, the size of the parity will be 13 (or 14 for  $GF(2^{14})$ )\*ECC level *bits*-- so for ECC8, 13 (or 14) bytes are required (per block).

#### 17.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming $GF(2^{13})$

In this case, we have 8 data blocks each consisting of 512 bytes. Since the flash has 218 spare bytes (1744 bits), first estimate an ECC level for the data blocks by first subtracting the number of metadata bytes from the spare bytes ( $218 - 10 = 208$  bytes = 1664 bits) then dividing the number of bits by 8 (number of blocks) and then by 13 (bits per ECC level).

$$(218 - 10) \times 8 = 1664/13(8) = 16$$

Therefore all the data blocks could be covered by ECC16 if the metadata had no parity. This isn't acceptable, so assume ECC14 for all the data blocks. Now calculate the number of free bits for the metadata parity as

$$1664 - (14) \times 13 \times 8 = 208$$

Therefore, 208 bits remain for metadata parity. Dividing by 13 (bits/ECC) gives 16, so the metadata can be covered with ECC16. The settings for this device would then be

**Table 17-1. Settings for 4K+218 FLASH**

Setting	Value
PAGE_SIZE	4096+218=4314=0x10DA
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	16=0x10

*Table continues on the next page...*

**Table 17-1. Settings for 4K+218 FLASH (continued)**

Setting	Value
GF0	GF( $2^{13}$ )
DATAN_SIZE	512=0x200 (in register interface, assigned as 0x80)
ECCN	14=0x0E
GFN	GF( $2^{13}$ )
NBLOCKS	8

### 17.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF( $2^{13}$ ) for data and GF( $2^{14}$ ) for metadata

This flash will have 118 bytes available for ECC (after subtracting the metadata size), therefore, 994 bits.

Dividing by  $4 * 14$  (number of blocks \* ECC level) we get 17.75, therefore we can support ECC16 on the data blocks. The number of free spare bits becomes  $944 - 16 * 4 * 14 = 944 - 896 = 48$ , divided by 13 = 3.69, therefore the metadata can be also covered by ECC2.

**Table 17-2. Settings for 4K+128 FLASH**

Setting	Value
PAGE_SIZE	4096+128=4224=0x1080
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	2
GF0	GF( $2^{13}$ )
DATAN_SIZE	1024=0x400 (in register interface, assigned as 0x100)
ECCN	16
GFN	GF( $2^{14}$ )
NBLOCKS	4

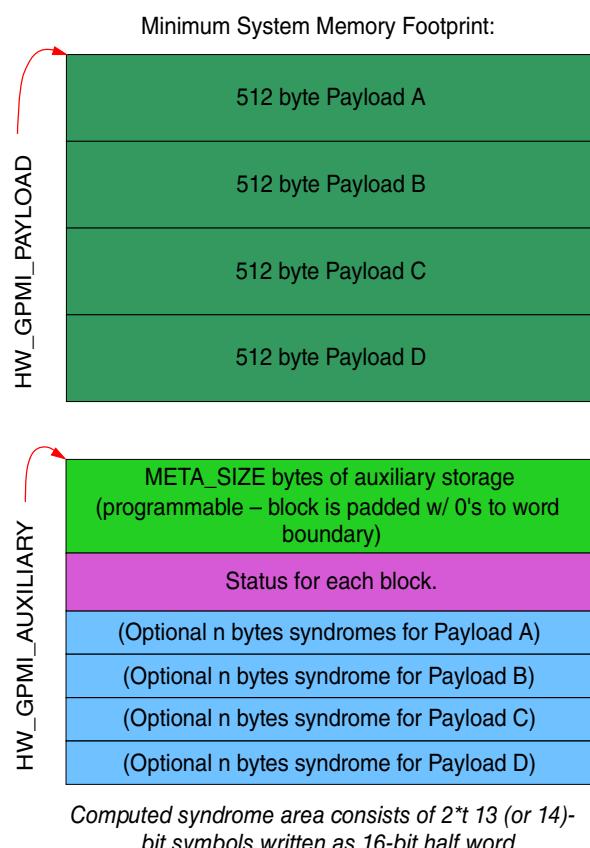

In this case, there will be additional unused spare bits, with the BCH will pad out with zeros.

### 17.2.4 Data Buffers in System Memory

While the data on the flash is interleaved with parity symbols, the BCH assumes that the data buffers in memory are contiguous.

Metadata read from the flash will be stored to the location pointed to by the GPMI\_AUXILIARY register and data will be written to the address specified in the GPMI\_PAYLOAD register as is shown in the following figure where the block length is 512 bytes for example. Since the number of blocks on a flash page is programmable, the BCH also writes individual block correction status to the auxiliary pointer at the word-aligned address following the end of the metadata. Optionally, the computed syndromes may also be written to the auxiliary area if the DEBUGSYNDROME bit is set in the control register.

As blocks complete processing, the bus master will accumulate the status for each block and write it to the auxiliary data buffer following the metadata. The metadata area will be padded with 0's until the next word boundary and the status for blocks 0-3 will be written to the next word. The status for subsequent blocks will then be written to the buffer. The status for the first block (metadata block) is also stored in the STATUS\_BLK0 register in the BCH\_STATUS register. The completion codes for the blocks are indicated in the [Table 17-3](#). Note that the definition of the bytes and their ordering in the auxiliary and payload storage areas are user defined. When this data is read back from the flash and put into memory, it will resemble the original buffer that was written out to the flash.

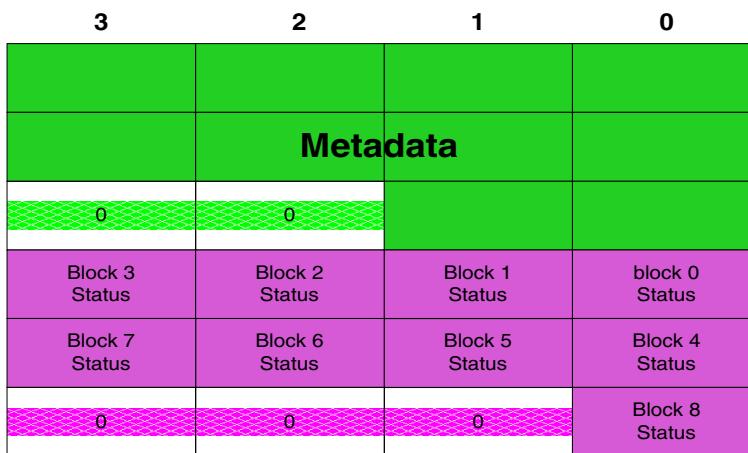

**Figure 17-4. BCH Data Buffers in Memory**

**Table 17-3. Status Block Completion Codes**

Code	Description
0xFF	Block is erased
0xFE	Block is uncorrectable
0x00	No errors found
0x01-0x28	Number of errors corrected

The following figure shows the layout of the bytes within the status field.

Status bytes are allocated based on the NBLOCKS programmed into the flash format register. The number of status bytes are computed by NBLOCK+1. The status area will be padded with zeros to the next word boundary.

Syndrome data written for debug purposes follows the end of the status block.

**Figure 17-5. Memory-to-Memory Operations**

## 17.3 Memory to Memory (Loopback) Operation

The BCH supports a memory-to-memory mode of operation where both the encoded and decoded buffers reside in system memory.

This can be useful for applications where data must be protected by ECC, but the storage device does not reside on the GPMI bus.

The BCH operation in memory to memory mode is much simpler than in GPMI mode since DMAs are not required to manage the operation. Instead, software simply writes the BCH\_DATAPTR and BCH\_METAPTR with the addresses of the data and metadata (auxiliary) buffers and the BCH\_ENCODEPTR with the address of the buffer for encoded data. To initiate the operation, software simply sets the M2M\_ENCODE and

M2M\_ENABLE bits in the control register. The BCH can be programmed to either issue an interrupt at the end of the operation or software may poll the status bits for completion.

Memory to memory decode operations work in a similar manner. The encoded data address is written to the BCH\_ENCODEPTR and the data and meta pointers are written to buffers that correspond to the desired decoded data addresses. To initiate a decode, software must set the M2M\_ENCODE bit to 0 while writing the M2M\_ENABLE bit. Note that the addresses written to the BCH\_DATAPTR, BCH\_METAPTR and BCH\_ENCODEPTR registers should always be aligned on a 4 byte boundary. In other words, the 2 lower bits of the address should always be written with zeros.

## 17.4 Programming the BCH/GPMI Interfaces

Programming the BCH for NAND operations consists largely of disabling the soft reset and clock bits (SFRST and CLKGATE) from the BCH\_CTRL register and then programming the flash layout registers to correspond to the format of the attached NAND device(s).

The BCH\_LAYOUTSELECT register should also be programmed to map the chip select of each attached device into one of the four layout registers.

The bulk of the programming is actually applied to the GPMI through PIO operations embedded in DMA command structures. The DMA will perform all the requisite handshaking with the GPMI interface to negotiate the address portion of the transfer, then the BCH will handle all the movement of data from memory to the GPMI (writes) or the GPMI to memory (reads). The BCH will direct all data blocks to the buffer pointed to by the PAYLOAD\_BUFFER and the metadata will be written to the AUXILIARY\_BUFFER. Both of these registers are located in the GPMI PIO data space and are communicated to the BCH hardware at the beginning of the transfer. Thus, the normal multi-NAND DMA based device interleaving is preserved, that is, four NANDs on four separate chip selects can be scheduled for read or write operations using the BCH. Whichever channel finishes its ready wait first and enters the DMA arbiter with its lock bit set owns the GPMI command interface and through it owns the BCH resources for the duration of its processing.

### 17.4.1 BCH Encoding for NAND Writes

The BCH encoder flowchart in [Figure 17-6](#) shows the detailed steps involved in programming and using the BCH encoder. This flowchart shows how to use the BCH block with the GPMI.

To use the BCH encoder with the GPMI's DMA, create a DMA command chain containing ten descriptor structures, as shown in [Figure 17-8](#) and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The ten descriptors perform the following tasks:

1. Disable the BCH block (in case it was enabled) and issue NAND write setup command byte (under CLE) and address bytes (under ALE).
2. Configure and enable the BCH and GPMI blocks to perform the NAND write.
3. Disable the BCH block and issue NAND write execute command byte (under CLE).
4. Wait for the NAND device to finish writing the data by watching the ready signal.
5. Check for NAND timeout through PSENSE.
6. Issue NAND status command byte (under CLE).
7. Read the status and compare against expected.
8. If status is incorrect or incomplete, branch to error handling descriptor chain.
9. Otherwise, write is complete and emit GPMI interrupt.

## Programming the BCH/GPMI Interfaces

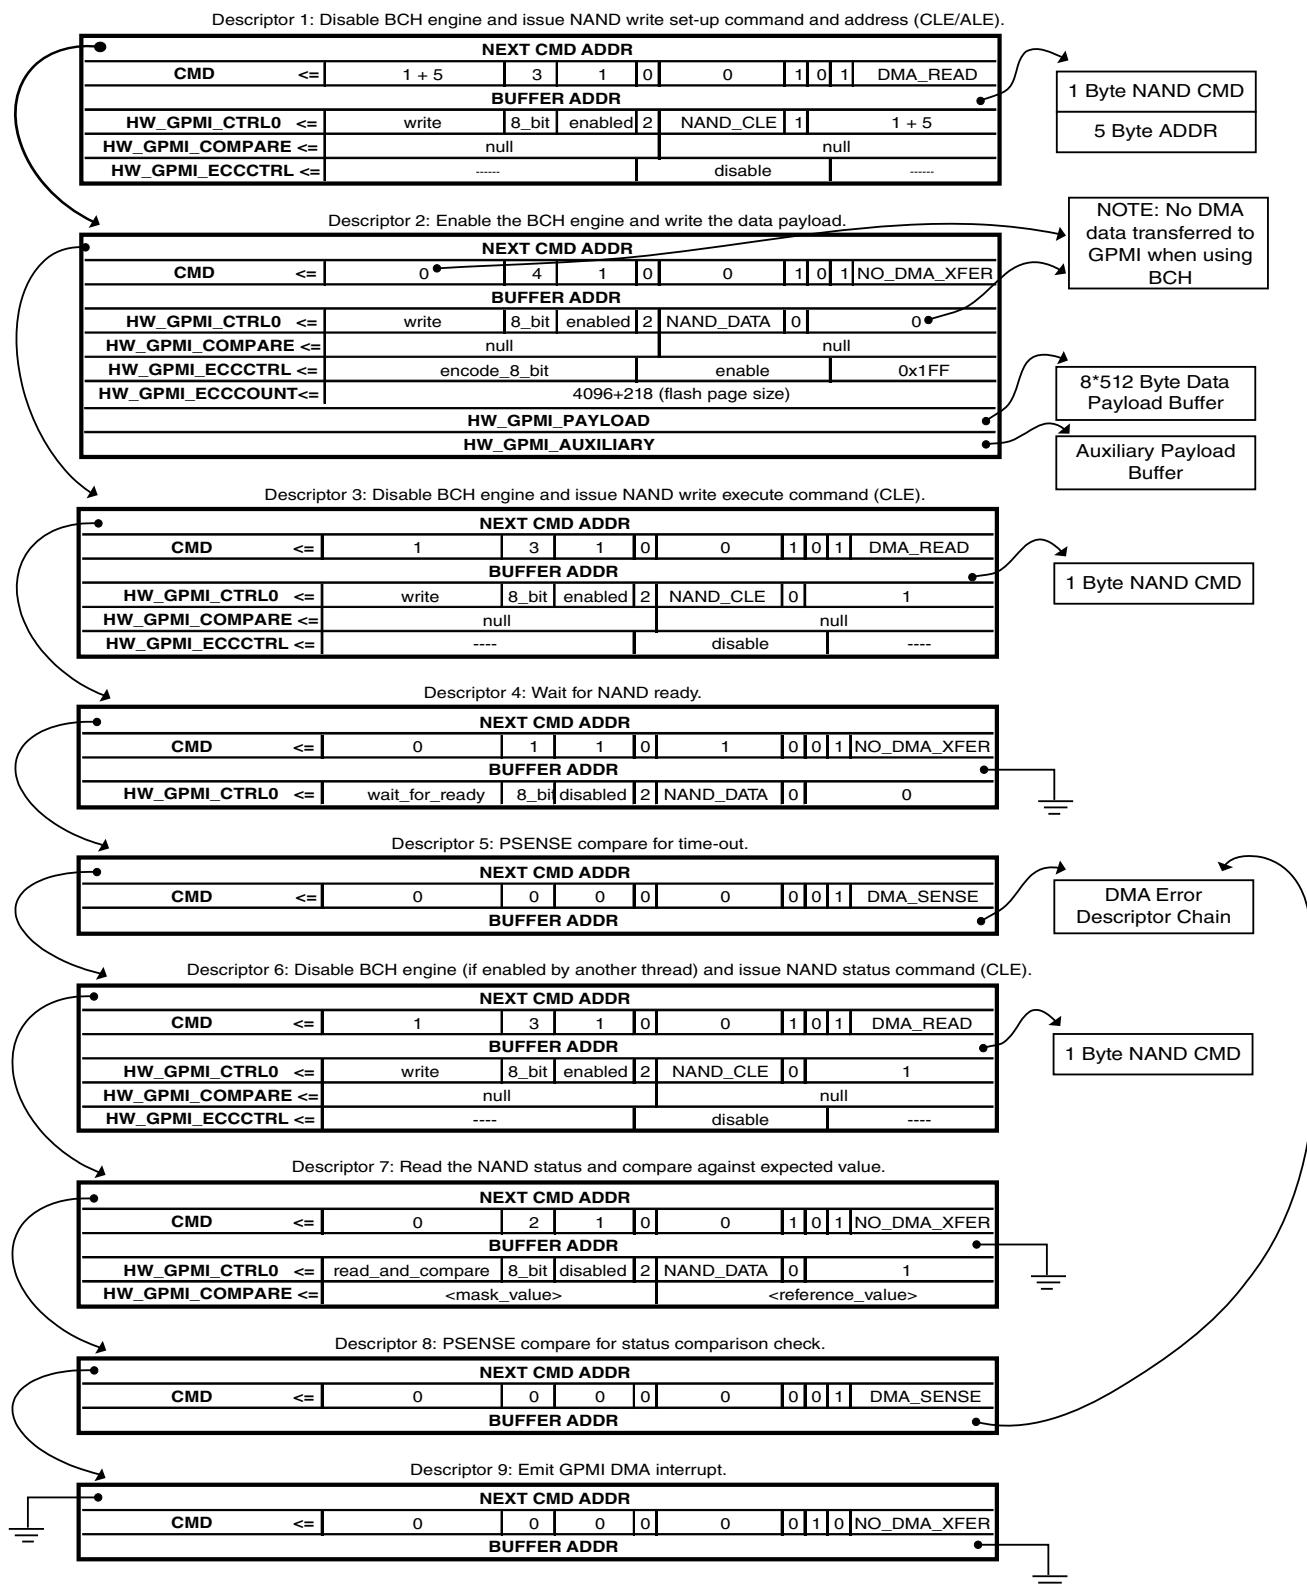

Figure 17-8. BCH Encode DMA Descriptor Chain

### 17.4.1.1 DMA Structure Code Example

The following code sample illustrates the coding for one write transaction involving 4096 bytes of data payload (eight 512-byte blocks) and 10 bytes of auxiliary payload (also referred to as metadata) to a 4K NAND page sitting on GPMI CS2.

```

//-----
// generic DMA/GPMI/ECC descriptor struct, order sensitive!
//-----
typedef struct {
    // DMA related fields
    unsigned int dma_nxtcmdar;
    unsigned int dma_cmd;
    unsigned int dma_bar;
    // GPMI related fields
    unsigned int gpmi_ctrl0;
    unsigned int gpmi_compare;
    unsigned int gpmi_eccctrl;
    unsigned int gpmi_ecccount;
    unsigned int gpmi_data_ptr;
    unsigned int gpmi_aux_ptr;
} GENERIC_DESCRIPTOR;
//-----
// allocate 10 descriptors for doing a NAND ECC Write
//-----
GENERIC_DESCRIPTOR write[10];
//-----
// DMA descriptor pointer to handle error conditions from psense checks
//-----
unsigned int * dma_error_handler;
//-----
// 8 byte NAND command and address buffer
// any alignment is ok, it is read by the GPMI DMA
// byte 0 is write setup command
// bytes 1-5 is the NAND address
// byte 6 is write execute command
// byte 7 is status command
//-----
unsigned char nand_cmd_addr_buffer[8];
//-----
// 4096 byte payload buffer used for reads or writes
// needs to be word aligned
//-----
unsigned int write_payload_buffer[(4096/4)];
//-----
// 65 byte meta-data to be written to NAND
// needs to be word aligned
//-----
unsigned int write_aux_buffer[65];
//-----
// Descriptor 1: issue NAND write setup command (CLE/ALE)
//-----
write[0].dma_nxtcmdar = &write[1];                                // point to the next descriptor
write[0].dma_cmd = BF_APBH_CHn_CMD_XFER_COUNT      (1 + 5) | // 1 byte command, 5 byte address
                  BF_APBH_CHn_CMD_CMDWORDS      (3)   | // send 3 words to the GPMI
                  BF_APBH_CHn_CMD_WAIT4ENDCMD (1)    | // wait for command to finish
before
                                                // continuing

BV_FLD(APBH_CHn_CMD, COMMAND, NO_DMA_XFER);    // no dma transfer

```

### 17.4.1.2 Using the BCH Encoder

To use the BCH encoder, first turn off the module-wide soft reset bit in both the GPMI and BCH blocks before starting any DMA activity.

Turning off the soft reset must take place by itself, prior to programming the rest of the control registers. Turn off the BCH bus master soft reset bit. Turn off the clock gate bits.

Program the remainder of the GPMI, BCH and APBH DMA as follows:

```

// bring APBH out of reset
APBH_CTRL0_CLR(BM_APBH_CTRL0_SFRST);
APBH_CTRL0_CLR(BM_APBH_CTRL0_CLKGATE);

// bring BCH out of reset
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

// bring gpmi out of reset
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_SFTRST);
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_CLKGATE);
GPMI_CTRL1_SET(BM_GPMI_CTRL1_DEV_RESET | // deassert reset
               BM_GPMI_CTRL1_BCH_MODE); // enable BCH mode

// enable pinctrl
PINCTRL_CTRL_WR(0x00000000);

// enable gpmi pins
PINCTRL_MUXSEL0_CLR(0x0000ffff); // data bits
PINCTRL_MUXSEL1_CLR(0x03ffffff); // control bits
PINCTRL_MUXSEL8_CLR(0x0003f3ff); // control bits
PINCTRL_MUXSEL8_SET(0x00015155); // control bits

```

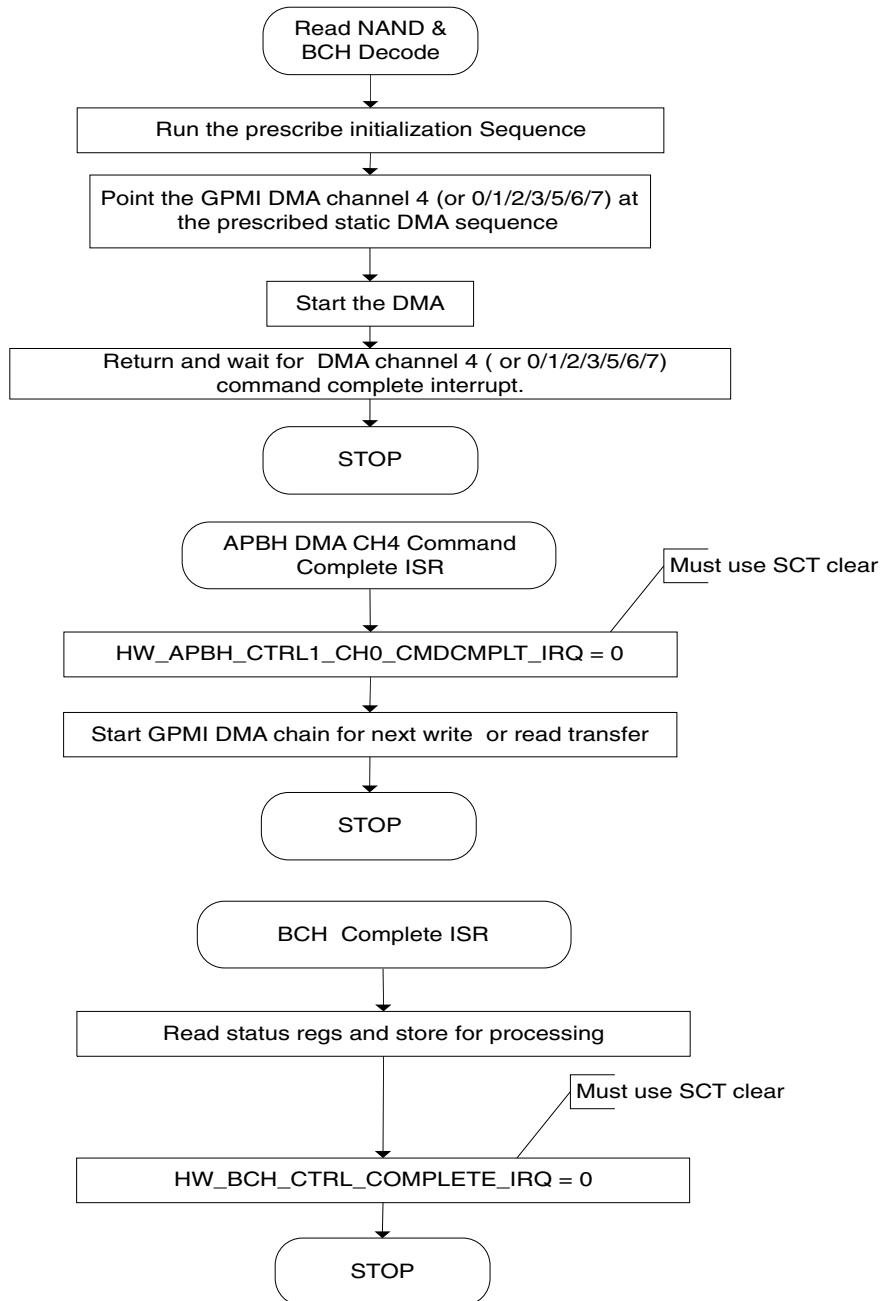

Note that for writing NANDs (ECC encoding), only GPMI DMA command complete interrupts are used. The BCH engine is used for writing to the NAND but may optionally produce an interrupt. From the sample code in [DMA Structure Code Example](#) :

- DMA descriptor 1 prepares the NAND for data write by using the GPMI to issue a write setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is disabled and not used for these commands.

- DMA descriptor 2 enables the BCH engine for encoding to begin the initial writing of the NAND data by specifying where the data and auxiliary payload are coming from in system memory.
- DMA descriptor 3 issues the write commit command byte under CLE to the NAND.
- DMA descriptor 4 waits for the NAND to complete the write commit/transfer by watching the NAND's ready line status. This descriptor relinquishes the NANDLOCK on the GPMI to enable the other DMA channels to initiate NAND transactions on different NAND CS lines.
- DMA descriptor 6 issues a NAND status command byte under "CLE" to check the status of the NAND device following the page write.
- DMA descriptor 7 reads back the NAND status and compares the status with an expected value. If there are differences, then the DMA processing engine follows an error-handling DMA descriptor path.
- DMA descriptor 8 disables the BCH engine and emits a GPMI interrupt to indicate that the NAND write has been completed.

## 17.4.2 BCH Decoding for NAND Reads

When a page is read from NAND flash, BCH syndromes will be computed and, if correctable errors are found, they will be corrected on a per block basis within the NAND page. This decoding process is fully overlapped with other NAND data reads and with CPU execution. The BCH decoder flowchart in the figure below shows the steps involved in programming the decoder. The hardware flow of reading and decoding a 4096-byte page is shown in [Figure 17-10](#).

**Figure 17-9. BCH Decode Flowchart**

Conceptually, an APHB DMA Channel (0,1,2 or 3) command chain with seven command structures linked together is used to perform the BCH decode operation (as shown in Figure 17-10).

### Note

The GPMI's DMA command structures controls the BCH decode operation.

To use the BCH decoder with the GPMI's DMA, create a DMA command chain containing seven descriptor structures, as shown in the figure below and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The seven DMA descriptors perform the following tasks:

1. Issue NAND read setup command byte (under "CLE") and address bytes (under "ALE").
2. Issue NAND read execute command byte (under "CLE").
3. Wait for the NAND device to complete accessing the block data by watching the ready signal.
4. Check for NAND timeout through "PSENSE".
5. Configure and enable the BCH block and read the NAND block data.
6. Disable the BCH block.
7. Descriptor NOP to allow NANDLOCK in the previous descriptor to be thread-safe.

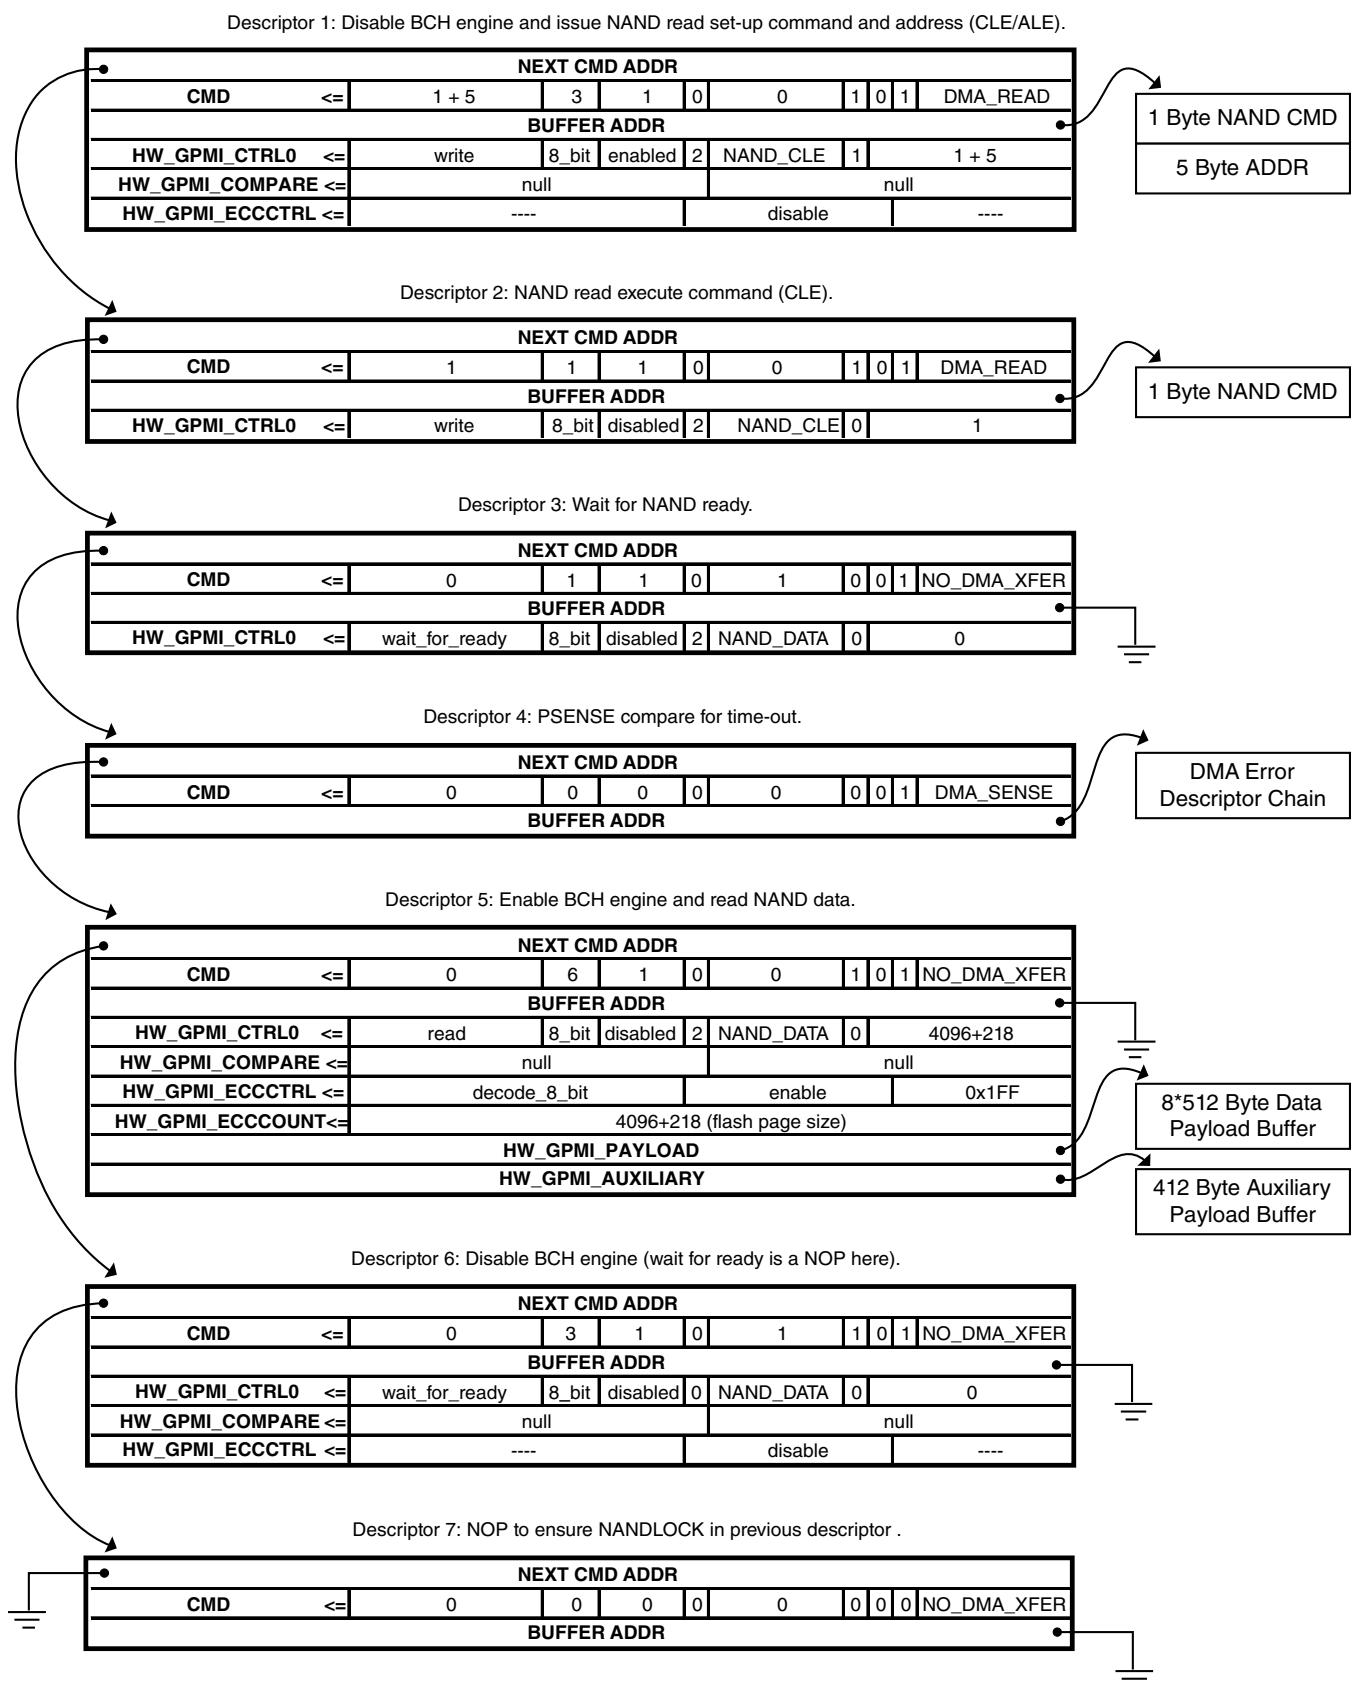

Figure 17-10. BCH Decode DMA Descriptor Chain

### 17.4.2.1 DMA Structure Code Example

The following sample code illustrates the coding for one read transaction, consisting of a seven DMA command structure chain for reading all 4096 bytes of payload data (eight 512-byte blocks) and 65 bytes of metadata with the associative parity bytes (8 \* (18) + 9) from a 4K NAND page sitting on GPMI CS2.

```

```

### 17.4.2.2 Using the Decoder

As illustrated in [Figure 17-10](#) and the sample code in [DMA Structure Code Example](#):

- DMA descriptor 1 prepares the NAND for data read by using the GPMI to issue a NAND read setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is not used for these commands.
- DMA descriptor 2 issues a one-byte read execute command to the NAND device that triggers its read access. The NAND then goes not ready.

- DMA descriptor 3 performs a wait for ready operation allowing the DMA chain to remain dormant until the NAND device completes its read access time.
- DMA descriptor 5 handles the reading and error correction of the NAND data. This command's PIOs activate the BCH engine to write the read NAND data to system memory and to process it for any errors that need to be corrected. This DMA descriptor contains two PIO values that are system memory addresses pointing to the PAYLOAD data area and to the AUXILIARY data area. These addresses are used by the BCH engine's AHB master to move data into system memory and to correct it. While this example is reading an entire 4K page—payload plus metadata—it is equally possible to read just one 512-byte payload block or just the uniquely protected metadata block in a single 7 DMA structure transfer.
- DMA descriptor 6 disables the BCH engine with the NANDLOCK asserted. This is necessary to ensure that the GPMI resource is not arbitrated to another DMA channel when multiple DMA channels are active concurrently.
- DMA descriptor 7 de-asserts the NANDLOCK to free up the GPMI resource to another channel.

As the BCH block receives data from the GPMI:

- The decoder transforms the read NAND data block into a BCH code word and computes the codeword syndrome.
- If no errors are present, then the BCH block can immediately report back to firmware. This report is passed as the `BCH_CTRL_COMPLETE_IRQ` interrupt status bit and the associated status registers in `BCH_STATUS0/1` registers.
- If an error is present, then the BCH block corrects the necessary data block or parity block bytes, if possible (not all errors are correctable).

As the BCH decoder reads the data and parity blocks, it records a special condition, i.e., that all of the bits of a payload data block or metadata block are one, including any associated parity bytes. The all-ones case for both parity and data indicates an erased block in the NAND device.

The `BCH_STATUS0` register contains a 4-bit field that indicates the final status of the auxiliary block. A value of 0x0 indicates no errors found for a block.

- A value of 1 to 20 inclusive indicates that many correctable errors were found and fixed.
- A value of 0xFE indicates uncorrectable errors detected on the block.

- A value of 0xFF indicates that the block was in the special ALL ONES state and is therefore considered to be an ERASED block.
- All other values are disallowed by the hardware design.

Recall that up to eight NAND devices can have DMA chains in-flight at once, i.e. they can all be contending for access to the GPMI data bus. It is impossible to predict which NAND device will enter the BCH engine with a transfer first, because each chain includes a wait4ready command structure. As a result, firmware should look at the BCH\_STATUS0\_COMPLETED\_CE bit field to determine which block is being reported in the status register. There is also a 16-bit HANDLE field in the GPMI\_ECCCTRL register that is passed down the pipeline with each transaction. This handle field can be used to speed firmware's detection of which transaction is being reported.

These examples of reading and writing have focused on full page transfers of 4K page NAND devices. Other device configurations can be specified by changing the ECCOUNT field in the GPMI registers and reprogramming the BCH's FLASHnLAYOUTm registers.

The BCH and GPMI blocks are designed to be very efficient at reading single 512 (or 1024)-byte pages in one transaction. With no errors, the transaction takes less than 20 HCLKs longer than the time to read the raw data from the NAND.

To summarize, the APBH DMA command chain for a BCH decode operation is shown in [Figure 17-10](#). Seven DMA command structures must be present for each NAND read transaction decoded by the BCH. The seven DMA command structures for multiple NAND read transaction blocks can be chained together to make larger units of work for the BCH, and each will produce an appropriate error report in the BCH PIO space. Multiple NAND devices can have such multiple chains scheduled. The results can come back out of order with respect to the multiple chains.

### 17.4.3 Interrupts

There are two interrupt sources used in processing BCH protected NAND read and write transfers.

Since all BCH operations are initiated by GPMI DMA command structures, the DMA completion interrupt for the GPMI is an important ISR. Both of the flow charts of [Figure 17-6](#) and [Figure 17-9](#) show the GPMI DMA complete ISR skeleton. In both reads and writes, the GPMI DMA completion interrupt is used to schedule work **INTO** the error correction pipeline. As the front end processing completes, the DMA interrupt is

## Behavior During Reset

generated and additional work, such as DMA chains, are passed to the GPMI DMA to keep it *fed*. For write operations, this is the only interrupt that is generated for processing the NAND write transfer.

For reads, however, two interrupts are needed. Every read is started by a GPMI DMA command chain and the front end queue is fed as described above. The back end of the read pipeline is drained by monitoring the BCH completion interrupt found int `HW_BCH_CTRL_COMPLETE_IRQ`.

An BCH transaction consists of reading or writing all of the blocks requested in the `HW_GPMI_ECCCTRL_BUFFER_MASK` bit field. As every read transaction completes, it posts the status of all of the blocks to the `HW_BCH_STATUS0` and `HW_BCH_STATUS1` registers and sets the completion interrupt. The five stages of the BCH read pipeline completes, one in the GPMI and four in the BCH, are independently stalled as they complete and try to deliver to the next stage in the data flow. Several of these stages can be skipped if no-errors are found or once an uncorrectable error is found in a block.

In any case, the final stage will stall if the status register is busy waiting for the CPU to take status register results. The hardware monitors the state of the `HW_BCH_CTRL_COMPLETE_IRQ` bit. If it is still set when the last pipeline stage is ready to post data, then the stage will stall. It follows that the next previous stage will stall when it is ready to hand off work to the final stage, and so on up the pipeline.

### CAUTION

It is important that firmware read the STATUS0/1 results and save them before clearing the interrupt request bit. Otherwise, a transaction and its results could be completely lost.

## 17.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically. The example code is shown below.

```
// A soft reset can take multiple clocks to complete, so do NOT gate the
// clock when setting soft reset. The reset process will gate the clock
// automatically. Poll until this has happened before subsequently
// preparing soft-reset and clock gate
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
// asserting soft-reset
BCH_CTRL_SET(BM_BCH_CTRL_SFTRST);
// waiting for confirmation of soft-reset
while (!BCH_CTRL.B.CLKGATE)
```

```

// busy wait
}
// Done.
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

```

## 17.6 BCH Memory Map/Register Definition

### BCH Hardware Register Format Summary

**BCH memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page

### 17.6.1 Hardware BCH ECC Accelerator Control Register (BCH\_CTRL*n*)

The BCH CTRL provides overall control of the hardware ECC accelerator

Address: 180\_8000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R						RSVD3							RSVD1				
W						DEBUG_STALL_IRQ_EN	RSVD2	COMPLETE_IRQ_EN					BM_ERROR_IRQ	DEBUG_STALL_IRQ	RSVD0	COMPLETE_IRQ	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**BCH\_CTRLn field descriptions**

Field	Description
31 SFTRST	Set this bit to 0 to enable normal BCH operation. Set this bit to 1 (default) to disable clocking with the BCH and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the BCH block to its default state. This bit resets all state machines except for the AHB master state machine  0x0 <b>RUN</b> — Allow BCH to operate normally. 0x1 <b>RESET</b> — Hold BCH in reset.
30 CLKGATE	This bit must be set to 0 for normal operation. When set to 1 it gates off the clocks to the block.  0x0 <b>RUN</b> — Allow BCH to operate normally. 0x1 <b>NO_CLKS</b> — Do not clock BCH gates in order to minimize power consumption.
29–23 RSVD5	This field is reserved.  This read-only field is reserved and always has the value 0.
22 DEBUGSYNDROME	(For debug purposes only). Enable write of computed syndromes to memory on BCH decode operations. Computed syndromes will be written to the auxiliary buffer after the status block. Syndromes will be written as padded 16-bit values.
21–20 RSVD4	This field is reserved.  This read-only field is reserved and always has the value 0
19–18 M2M_LAYOUT	Selects the flash page format for memory-to-memory operations.
17 M2M_ENCODE	Selects encode (parity generation) or decode (correction) mode for memory-to-memory operations.
16 M2M_ENABLE	NOTE! WRITING THIS BIT INITIATES A MEMORY-TO-MEMORY OPERATION. The BCH module must be inactive (not processing data from the GPMI) when this bit is set. The M2M_ENCODE and

*Table continues on the next page...*

**BCH\_CTRLn field descriptions (continued)**

Field	Description
	M2M_LAYOUT bits as well as the ENCODEPTR, DATAPTR, and METAPTR registers are used for memory-to-memory operations and must be correctly programmed before writing this bit.
15–11 RSVD3	This field is reserved.  This read-only field is reserved and always has the value 0
10 DEBUG_STALL_ IRQ_EN	1 = interrupt on debug stall mode is enabled. The IRQ is raised on every block
9 RSVD2	This field is reserved.  This read-only field is reserved and always has the value 0.
8 COMPLETE_IRQ_ EN	1 = interrupt on completion of correction is enabled.
7–4 RSVD1	This field is reserved.  This read-only field is reserved and always has the value 0.
3 BM_ERROR_IRQ	AHB Bus interface Error Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
2 DEBUG_STALL_IRQ	DEBUG STALL Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
1 RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
0 COMPLETE_IRQ	This bit indicates the state of the external interrupt line. Write a 1 to the SCT clear address to clear the interrupt status bit. NOTE: subsequent ECC completions will be held off as long as this bit is set. Be sure to read the data from BCH_STATUS0, 1 before clearing this interrupt bit.

## 17.6.2 Hardware ECC Accelerator Status Register 0 (BCH\_STATUS0n)

The BCH STAT register provides visibility into the run-time status of the BCH and status information when processing is complete. It provides overall status of the hardware ECC accelerator.

## BCH Memory Map/Register Definition

Address: 180\_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### BCH\_STATUS0n field descriptions

Field	Description
31–20 HANDLE	Software supplies a 12 bit handle for this transfer as part of the GPMI DMA PIO operation that started the transaction. That handle passes down the pipeline and ends up here at the time the BCH interrupt is signaled.
19–16 COMPLETED_CE	This is the chip enable number corresponding to the NAND device from which this data came.
15–8 STATUS_BLK0	Count of symbols in error during processing of first block of flash (metadata block). The number of errors reported will be in the range of 0 to the ECC correction level for block 0.  0x00 <b>ZERO</b> — No errors found on block.

Table continues on the next page...

**BCH\_STATUS0n field descriptions (continued)**

Field	Description
	0x01 <b>ERROR1</b> — One error found on block. 0x02 <b>ERROR2</b> — One errors found on block. 0x03 <b>ERROR3</b> — One errors found on block. 0x04 <b>ERROR4</b> — One errors found on block. 0xFE <b>UNCORRECTABLE</b> — Block exhibited uncorrectable errors. 0xFF <b>ERASED</b> — Page is erased.
7–5 RSVD1	This field is reserved.  This read-only field is reserved and always has the value 0.
4 ALLONES	1 = All data bits of this transaction are ONE.
3 CORRECTED	1 = At least one correctable error encountered during last processing cycle.
2 UNCORRECTABLE	1 = Uncorrectable error encountered during last processing cycle.
RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.

**17.6.3 Hardware ECC Accelerator Mode Register (BCH\_MODEn)**

The BCH MODE register provides additional mode controls.

Contains additional global mode controls for the BCH engine.

Address: 180\_8000h base + 20h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD																															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**BCH\_MODEn field descriptions**

Field	Description
31–8 RSVD	This field is reserved.  This read-only field is reserved and always has the value 0.
ERASE_THRESHOLD	This value indicates the maximum number of zero bits on a flash subpage for it to be considered erased. For SLC NAND devices, this value should be programmed to 0 (meaning that the entire page should consist of bytes of 0xFF). For MLC NAND devices, bit errors may occur on reads (even on blank pages), so this threshold can be used to tune the erased page checking algorithm.

## 17.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH\_ENCODEPTRn)

When performing memory to memory operations, indicates the address of the encode buffer. This register should be programmed before writing a 1 to the M2M\_ENABLE bit in the CTRL register.

For memory to memory operations, this register is used as the pointer to the encoded data, which is an output when encoding and an input while decoding.

Address: 180\_8000h base + 30h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### BCH\_ENCODEPTRn field descriptions

Field	Description
ADDR	Address pointer to encode buffer. This is the source for decode operations and the destination for encode operations. This value must be aligned on a 4 bytes boundary.

## 17.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH\_DATAPTRn)

When performing memory to memory operations, indicates the address of the data buffer.

For memory to memory operations, this register is used as the pointer to the data to encode or the destination buffer for decode operations.

Address: 180\_8000h base + 40h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### BCH\_DATAPTRn field descriptions

Field	Description
ADDR	Address pointer to data buffer. This is the source for encode operations and the destination for decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary.

## 17.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH\_METAPTRn)

When performing memory to memory operations, indicates the address of the metadata buffer.

For memory to memory operations, this register is used as the pointer to the metadata to encode or the extracted metadata for decode operations.

Address: 180\_8000h base + 50h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### BCH\_METAPTRn field descriptions

Field	Description
ADDR	Address pointer to metadata buffer. This is the source for encode metadata read operations and the destination for metadata decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 bytes boundary.

## 17.6.7 Hardware ECC Accelerator Layout Select Register (BCH\_LAYOUTSELECTn)

The BCH LAYOUTSELECT register provides a mapping of chip selects to layout registers.

When the BCH engine receives a request to process a data block from the GPMI interface, it will use this register to map the incoming chip select to one of the four possible flash layout registers

Address: 180\_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**BCH\_LAYOUTSELECT $n$  field descriptions**

Field	Description
31–30 CS15_SELECT	Selects which layout is used for chip select 15.
29–28 CS14_SELECT	Selects which layout is used for chip select 14.
27–26 CS13_SELECT	Selects which layout is used for chip select 13.
25–24 CS12_SELECT	Selects which layout is used for chip select 12.
23–22 CS11_SELECT	Selects which layout is used for chip select 11.
21–20 CS10_SELECT	Selects which layout is used for chip select 10.
19–18 CS9_SELECT	Selects which layout is used for chip select 9.
17–16 CS8_SELECT	Selects which layout is used for chip select 8.
15–14 CS7_SELECT	Selects which layout is used for chip select 7.
13–12 CS6_SELECT	Selects which layout is used for chip select 6.
11–10 CS5_SELECT	Selects which layout is used for chip select 5.
9–8 CS4_SELECT	Selects which layout is used for chip select 4.
7–6 CS3_SELECT	Selects which layout is used for chip select 3.
5–4 CS2_SELECT	Selects which layout is used for chip select 2.
3–2 CS1_SELECT	Selects which layout is used for chip select 1.
CS0_SELECT	Selects which layout is used for chip select 0.

### 17.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH\_FLASH0LAYOUT0 $n$ )

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT1 register to control the format for the devices selecting layout 0 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GMPI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See sections [Flash Page Layout](#) and [Determining the ECC layout for a device](#) for more detail information on setting up the flash layout registers.

Address: 180\_8000h base + 80h offset + (4d × i), where i=0d to 3d

### BCH\_FLASH0LAYOUT0n field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. <ul style="list-style-type: none"> <li>0x0 <b>NONE</b> — No ECC to be performed</li> <li>0x1 <b>ECC2</b> — ECC 2 to be performed</li> <li>0x2 <b>ECC4</b> — ECC 4 to be performed</li> <li>0x3 <b>ECC6</b> — ECC 6 to be performed</li> <li>0x4 <b>ECC8</b> — ECC 8 to be performed</li> <li>0x5 <b>ECC10</b> — ECC 10 to be performed</li> <li>0x6 <b>ECC12</b> — ECC 12 to be performed</li> <li>0x7 <b>ECC14</b> — ECC 14 to be performed</li> </ul>

10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14																																										
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.																																										

### 17.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH\_FLASH1LAYOUT0n)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT1 register to control the format for the devices selecting layout 1 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GMPI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

## BCH Memory Map/Register Definition

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See sections [Flash Page Layout](#) and [Determining the ECC layout for a device](#) for more detail information on setting up the flash layout registers.

10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14																																										
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.																																										

### 17.6.12 Hardware BCH ECC Flash 2 Layout 0 Register (BCH\_FLASH2LAYOUT0n)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH2LAYOUT1 register to control the format for the devices selecting layout 2 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GMPI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data,

metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See sections [Flash Page Layout](#) and [Determining the ECC layout for a device](#) for more detail information on setting up the flash layout registers.

### BCH\_FLASH2LAYOUT0n field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that eight subsequent blocks are present for a total of nine blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and will be covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. <ul style="list-style-type: none"> <li>0x0 <b>NONE</b> — No ECC to be performed</li> <li>0x1 <b>ECC2</b> — ECC 2 to be performed</li> <li>0x2 <b>ECC4</b> — ECC 4 to be performed</li> <li>0x3 <b>ECC6</b> — ECC 6 to be performed</li> <li>0x4 <b>ECC8</b> — ECC 8 to be performed</li> <li>0x5 <b>ECC10</b> — ECC 10 to be performed</li> <li>0x6 <b>ECC12</b> — ECC 12 to be performed</li> <li>0x7 <b>ECC14</b> — ECC 14 to be performed</li> </ul>

### BCH\_FLASH3LAYOUT0n field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and will be covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field.  0x0 <b>NONE</b> — No ECC to be performed 0x1 <b>ECC2</b> — ECC 2 to be performed 0x2 <b>ECC4</b> — ECC 4 to be performed 0x3 <b>ECC6</b> — ECC 6 to be performed 0x4 <b>ECC8</b> — ECC 8 to be performed 0x5 <b>ECC10</b> — ECC 10 to be performed 0x6 <b>ECC12</b> — ECC 12 to be performed 0x7 <b>ECC14</b> — ECC 14 to be performed

**BCH\_FLASH3LAYOUT1n field descriptions**

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accomodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). <ul style="list-style-type: none"> <li>0x0 <b>NONE</b> — No ECC to be performed</li> <li>0x1 <b>ECC2</b> — ECC 2 to be performed</li> <li>0x2 <b>ECC4</b> — ECC 4 to be performed</li> <li>0x3 <b>ECC6</b> — ECC 6 to be performed</li> <li>0x4 <b>ECC8</b> — ECC 8 to be performed</li> <li>0x5 <b>ECC10</b> — ECC 10 to be performed</li> <li>0x6 <b>ECC12</b> — ECC 12 to be performed</li> <li>0x7 <b>ECC14</b> — ECC 14 to be performed</li> <li>0x8 <b>ECC16</b> — ECC 16 to be performed</li> <li>0x9 <b>ECC18</b> — ECC 18 to be performed</li> <li>0xA <b>ECC20</b> — ECC 20 to be performed</li> <li>0xB <b>ECC22</b> — ECC 22 to be performed</li> <li>0xC <b>ECC24</b> — ECC 24 to be performed</li> <li>0xD <b>ECC26</b> — ECC 26 to be performed</li> <li>0xE <b>ECC28</b> — ECC 28 to be performed</li> <li>0xF <b>ECC30</b> — ECC 30 to be performed</li> <li>0x10 <b>ECC32</b> — ECC 32 to be performed</li> <li>0x11 <b>ECC34</b> — ECC 34 to be performed</li> <li>0x12 <b>ECC36</b> — ECC 36 to be performed</li> <li>0x13 <b>ECC38</b> — ECC 38 to be performed</li> <li>0x14 <b>ECC40</b> — ECC 40 to be performed</li> </ul>
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

**17.6.16 Hardware BCH ECC Debug Register0 (BCH\_DEBUG0n)**

The hardware BCH accelerator internal state machines and signals can be seen in the ECC debug register.

The BCH\_DEBUG0 register provides access to various internal state information which might prove useful during hardware debug and validation.

Address: 180\_8000h base + 100h offset + (4d x i), where i=0d to 3d

## BCH DEBUG0n field descriptions

Field	Description
31–25 RSVD1	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
24–16 KES_DEBUG_ SYNDROME_ SYMBOL	<p>The 9 bit value in this bit field shifts into the syndrome register array at the input of the KES engine whenever BCH_DEBUG0_KES_DEBUG_SHIFT_SYND is toggled.</p>
	<p>0x0 <b>NORMAL</b> — Bus master address generator for SYND_GEN writes operates normally.</p>
	<p>0x1 <b>TEST_MODE</b> — Bus master address generator always addresses last four bytes in Auxiliary block.</p>
15 KES_DEBUG_ SHIFT_SYND	<p>Toggling this bit causes the value in BCH_DEBUG0_KES_SYNDROME_SYMBOL to be shift into the syndrome register array at the input to the KES engine. After shifting in 16 symbols, one can kick off both KES and CF cycles by toggling BCH_DEBUG0_KES_DEBUG_KICK. Make sure that set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.</p>

*Table continues on the next page...*

**BCH\_DEBUG0n field descriptions (continued)**

Field	Description
14 KES_DEBUG_ PAYLOAD_FLAG	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input payload flag.  0x1 <b>DATA</b> — Payload is set for 512 bytes data block. 0x1 <b>AUX</b> — Payload is set for 65 or 19 bytes auxiliary block.
13 KES_DEBUG_ MODE4K	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input mode (4K or 2K pages).  0x1 <b>4k</b> — Mode is set for 4K NAND pages. 0x1 <b>2k</b> — Mode is set for 2K NAND pages.
12 KES_DEBUG_ KICK	Toggling causes KES engine FSM to start as if kick by the Bus Master. This allows stand alone testing of the KES and Chien Search engines. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.
11 KES_ STANDALONE	Set to one, cause the KES engine to suppress toggling the KES_BM_DONE signal to the bus master and suppress toggling the CF_BM_DONE signal by the CF engine.  0x0 <b>NORMAL</b> — Bus master address generator for SYND_GEN writes operates normally. 0x1 <b>TEST_MODE</b> — Bus master address generator always addresses last four bytes in Auxiliary block.
10 KES_DEBUG_ STEP	Toggling this bit causes the KES FSM to skip passed the stall state if it is in DEBUG_STALL mode and completed processing a block.
9 KES_DEBUG_ STALL	Set to one to cause KES FSM to stall after notifying Chien search engine to start processing its block but before notifying the bus master that the KES computation is complete. This allows a diagnostic to stall the FSM after each blocks key equations are solved. This also has the effect of stalling the CSFE search engine so its state can be examined after it finishes processing the KES stalled block.  0x0 <b>NORMAL</b> — KES FSM proceeds to next block supplied by bus master. 0x1 <b>WAIT</b> — KES FSM waits after current equations are solved and the search engine is started.
8 BM_KES_TEST_ BYPASS	1 = Point all SYND_GEN writes to dummy area at the end of the AUXILLIARY block so that diagnostics can preload all payload, parity bytes and computed syndrome bytes for test the KES engine.  0x0 <b>NORMAL</b> — Bus master address generator for SYND_GEN writes operates normally. 0x1 <b>TEST_MODE</b> — Bus master address generator always addresses last four bytes in Auxiliary block.
7–6 RSVD0	This field is reserved.  This read-only field is reserved and always has the value 0.
DEBUG_REG_ SELECT	The value loaded in this bit field is used to select the internal register state view of KES engine or the Chien search engine.

**17.6.17 KES Debug Read Register (BCH\_DBGKESREADn)**

The hardware BCH ECC accelerator key equation solver internal state machines and signals can be seen in the ECC debug registers.

Address: 180\_8000h base + 110h offset + (4d × i), where i=0d to 3d

# **Chapter 18**

## **Clock Controller Module (CCM)**

### **18.1 Overview**

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of power gating operations.

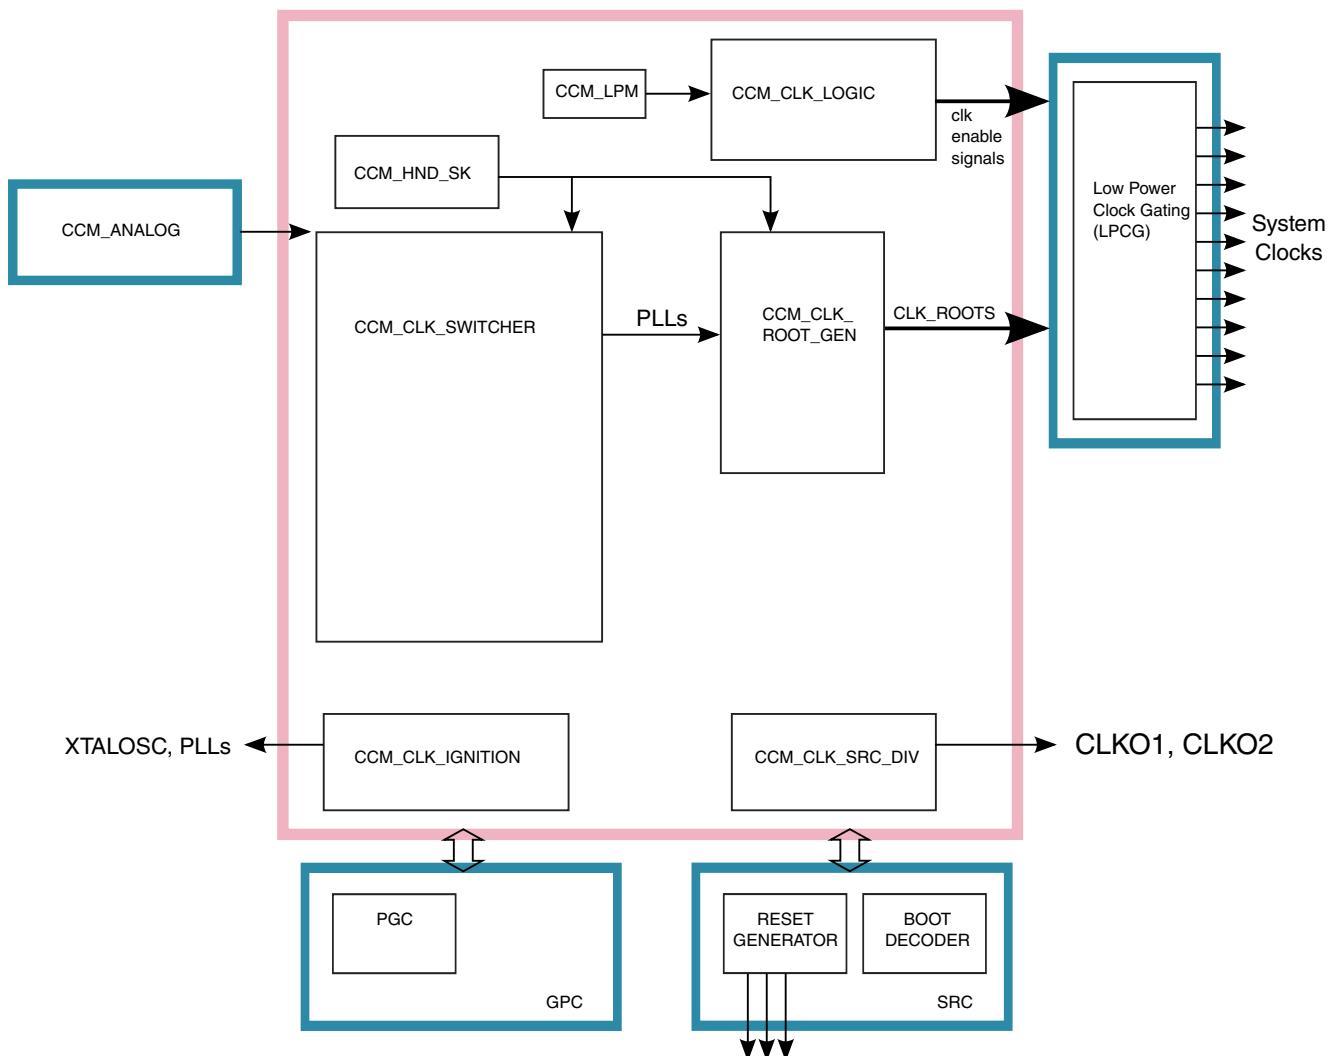

#### **18.1.1 Features**

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM\_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

### **18.1.2 CCM Block Diagram**

**Figure 18-1. Block Diagram**

CCM contains the following sub-blocks:

**Table 18-1. CCM Sub-blocks**

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates switcher clock outputs (pll1_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

*Table continues on the next page...*

**Table 18-1. CCM Sub-blocks (continued)**

CCM_CLK_SRC_DIV Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_HND_SK	Manages the handshake when changing certain root clock dividers that require handshake.

## 18.2 External Signals

The following table describes the external signals of CCM:

**Table 18-2. CCM External Signals**

Signal	Description	Pad	Mode	Direction
CCM_CLKO1	Observability clock 1 output	JTAG_TMS	ALT3	O
		SD1_DATA2	ALT6	
CCM_CLKO2	Observability clock 2 output	JTAG_TDO	ALT3	O
		SD1_DATA3	ALT6	
CCM_REF_EN_B	Enable external reference clock (CKIH)	GPIO1_IO06	ALT7	O

## 18.3 CCM Clock Tree

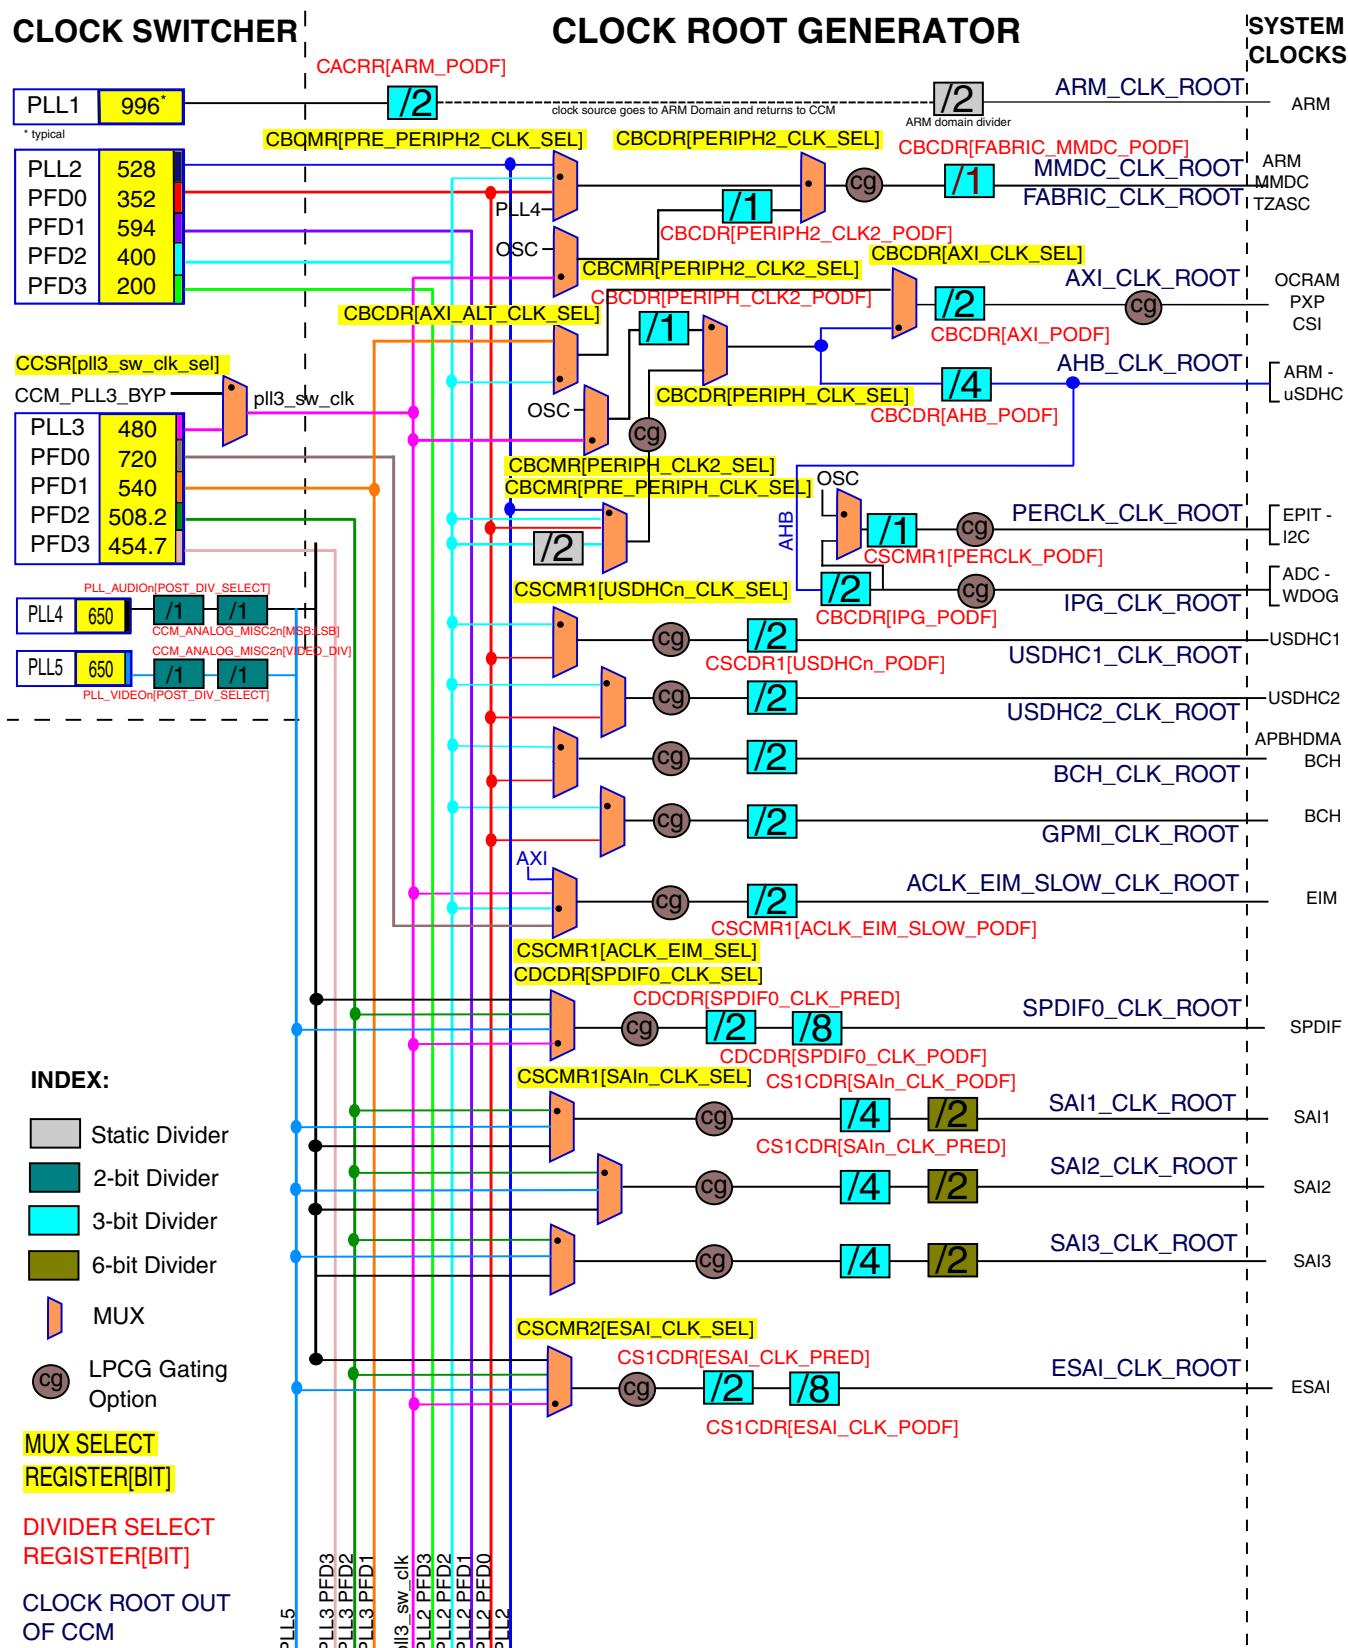

The following figures (Part 1 and Part 2) show the clock tree configuration and clock roots for CCM.

For detailed sub-block information, see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

### NOTE

The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree diagram that follows. The PLLs and PFDs control registers may be reprogrammed according to the speed grade of the SoC being used, but should not exceed that maximum setting for that speed grade.

**Figure 18-2. Clock Tree - Part 1**

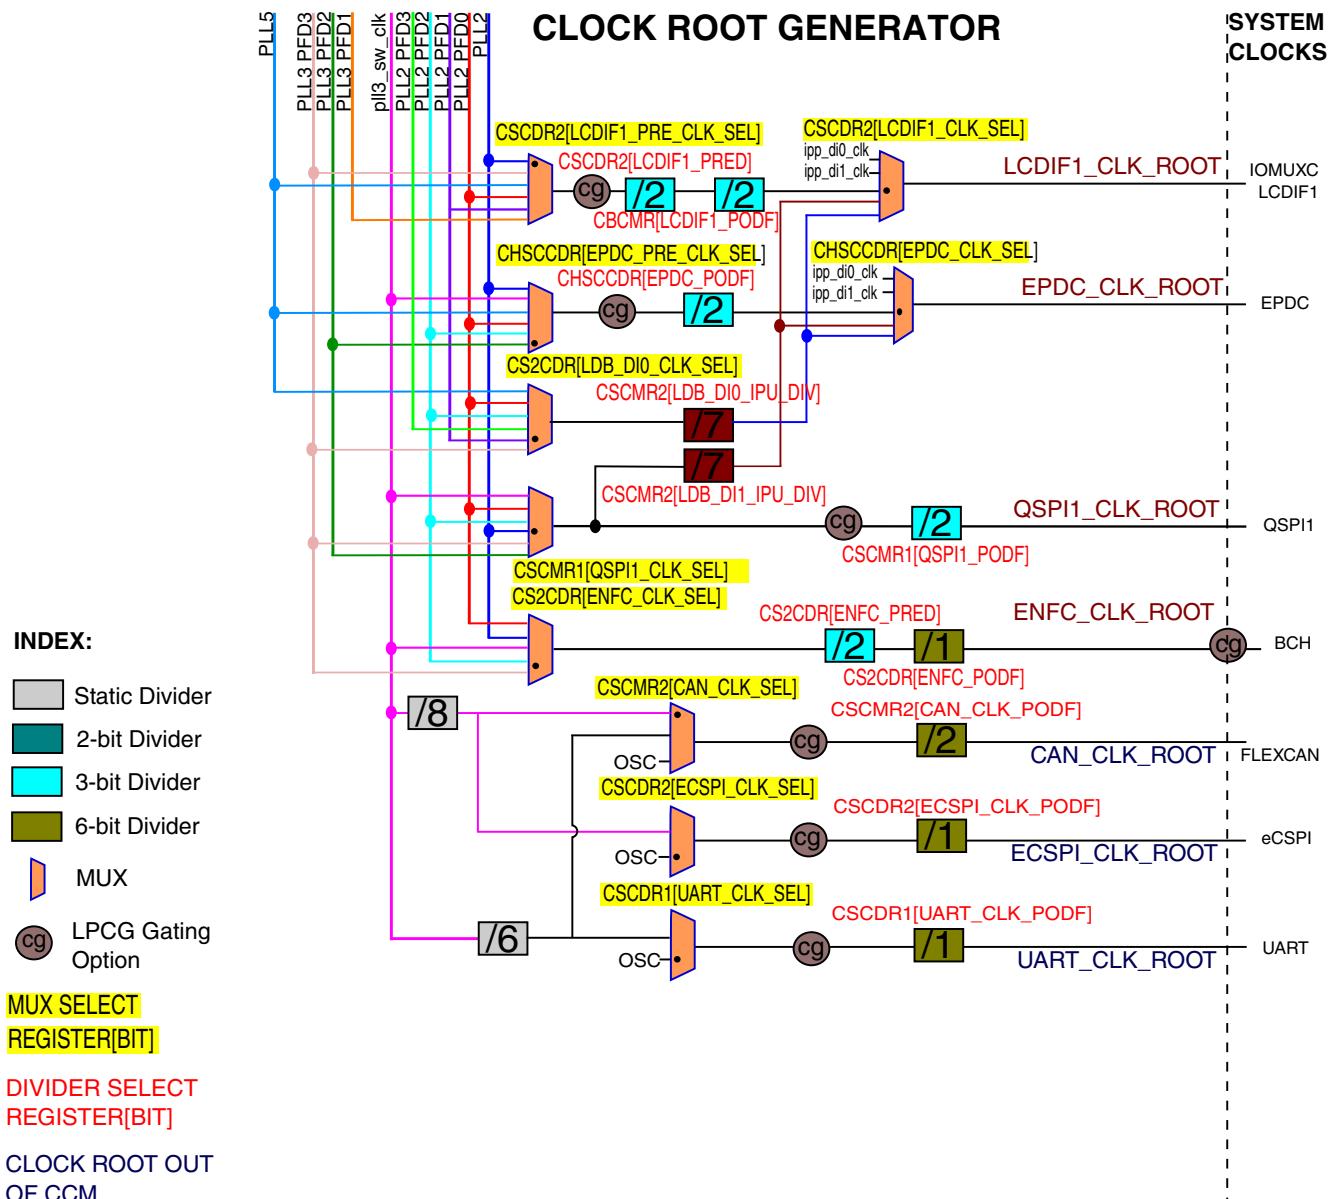

Figure 18-3. Clock Tree - Part 2

## 18.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

**Table 18-3. System Clocks, Gating, and Override**

Module	Module Clock	Clock Root	Module Clock Gating Enable	Module Override Enable
ADC $n$	IPG_CLK	IPG_CLK_ROOT	CCGR1[CG8] (ADC1_CLK_ENABLE) CCGR1[CG4] (ADC2_CLK_ENABLE)

**Table 18-4. System Clock Frequency Values**

Clock Root	Default Frequency (MHz)	Maximum Frequency (MHz)
ARM_CLK_ROOT	12	528

*Table continues on the next page...*

**Table 18-4. System Clock Frequency Values (continued)**

Clock Root	Default Frequency (MHz)	Maximum Frequency (MHz)
MMDC_CLK_ROOT	24	396
FABRIC_CLK_ROOT		
AXI_CLK_ROOT	12	264
AHB_CLK_ROOT	6	132
PERCLK_CLK_ROOT	3	66
IPG_CLK_ROOT	3	66
USDHCn_CLK_ROOT	12	198
ACLK_EIM_SLOW_CLK_ROOT	6	132
SPDIFO_CLK_ROOT	1.5	66.6
SAIn_CLK_ROOT	3	66.6
LCDIF_CLK_ROOT	6	150
EPDC_CLK_ROOT	12	264
QSPI_CLK_ROOT	12	396
ENFC_CLK_ROOT	12	198
CAN_CLK_ROOT	1.5	80
ECSPI_CLK_ROOT	3	60
UART_CLK_ROOT	4	80

**NOTE**

The default frequency is reset value after system power on reset. It is different with the value initialized by ROM code, which depends on boot CFG pins/fuse setting.

## 18.5 Functional Description

This section provides a complete functional description of the block.

### 18.5.1 Clock Generation

#### 18.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG\_CLK and supplied to modules that need it.

### **18.5.1.1.1 CKIL synchronizing to IPG\_CLK**

CKIL is synchronized to ipg\_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG\_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

### **18.5.1.2 External High Frequency Clock - CKIH and internal oscillator**

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

### **18.5.1.3 PLL reference clock**

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency )

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/Register Definition](#) for register information.

#### **18.5.1.3.1 ARM PLL**

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM\_ANALOG\_PLL\_ARM[DIV\_SELECT].

PLL output frequency = Fref \* DIV\_SEL/2

**NOTE**

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

**18.5.1.3.2 USB PLLs**

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV\_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

**18.5.1.3.3 System PLL**

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 4 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM\_ANALOG\_PLL\_SYS\_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}{\text{CCM\_ANALOG\_PLL\_SYS\_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STEP]}}{2 \times \text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}$$

Although this PLL does have a DIV\_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

### 18.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4, /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_AUDIO, CCM\_ANALOG\_PLL\_VIDEO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV\_SELECT} + \text{NUM/DENOM})$$

### 18.5.1.3.5 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The reference clocks generated by this PLL are:

- ref\_enetpll0 programmable to 25, 50, 100 and 125 MHz by setting CCM\_ANALOG\_PLL\_ENET[DIV\_SELECT] bitfield
- ref\_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM\_ANALOG\_PLL\_ENET[DIV\_SELECT] bitfield
- ref\_enetpll2 fixed at 25 MHz

### 18.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to  $F_{VCO} * 18/N$ , N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at [www.nxp.com](http://www.nxp.com) for procedure details.

### 18.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM\_CLK\_SWITCHER

CCM\_CLK\_ROOT\_GEN

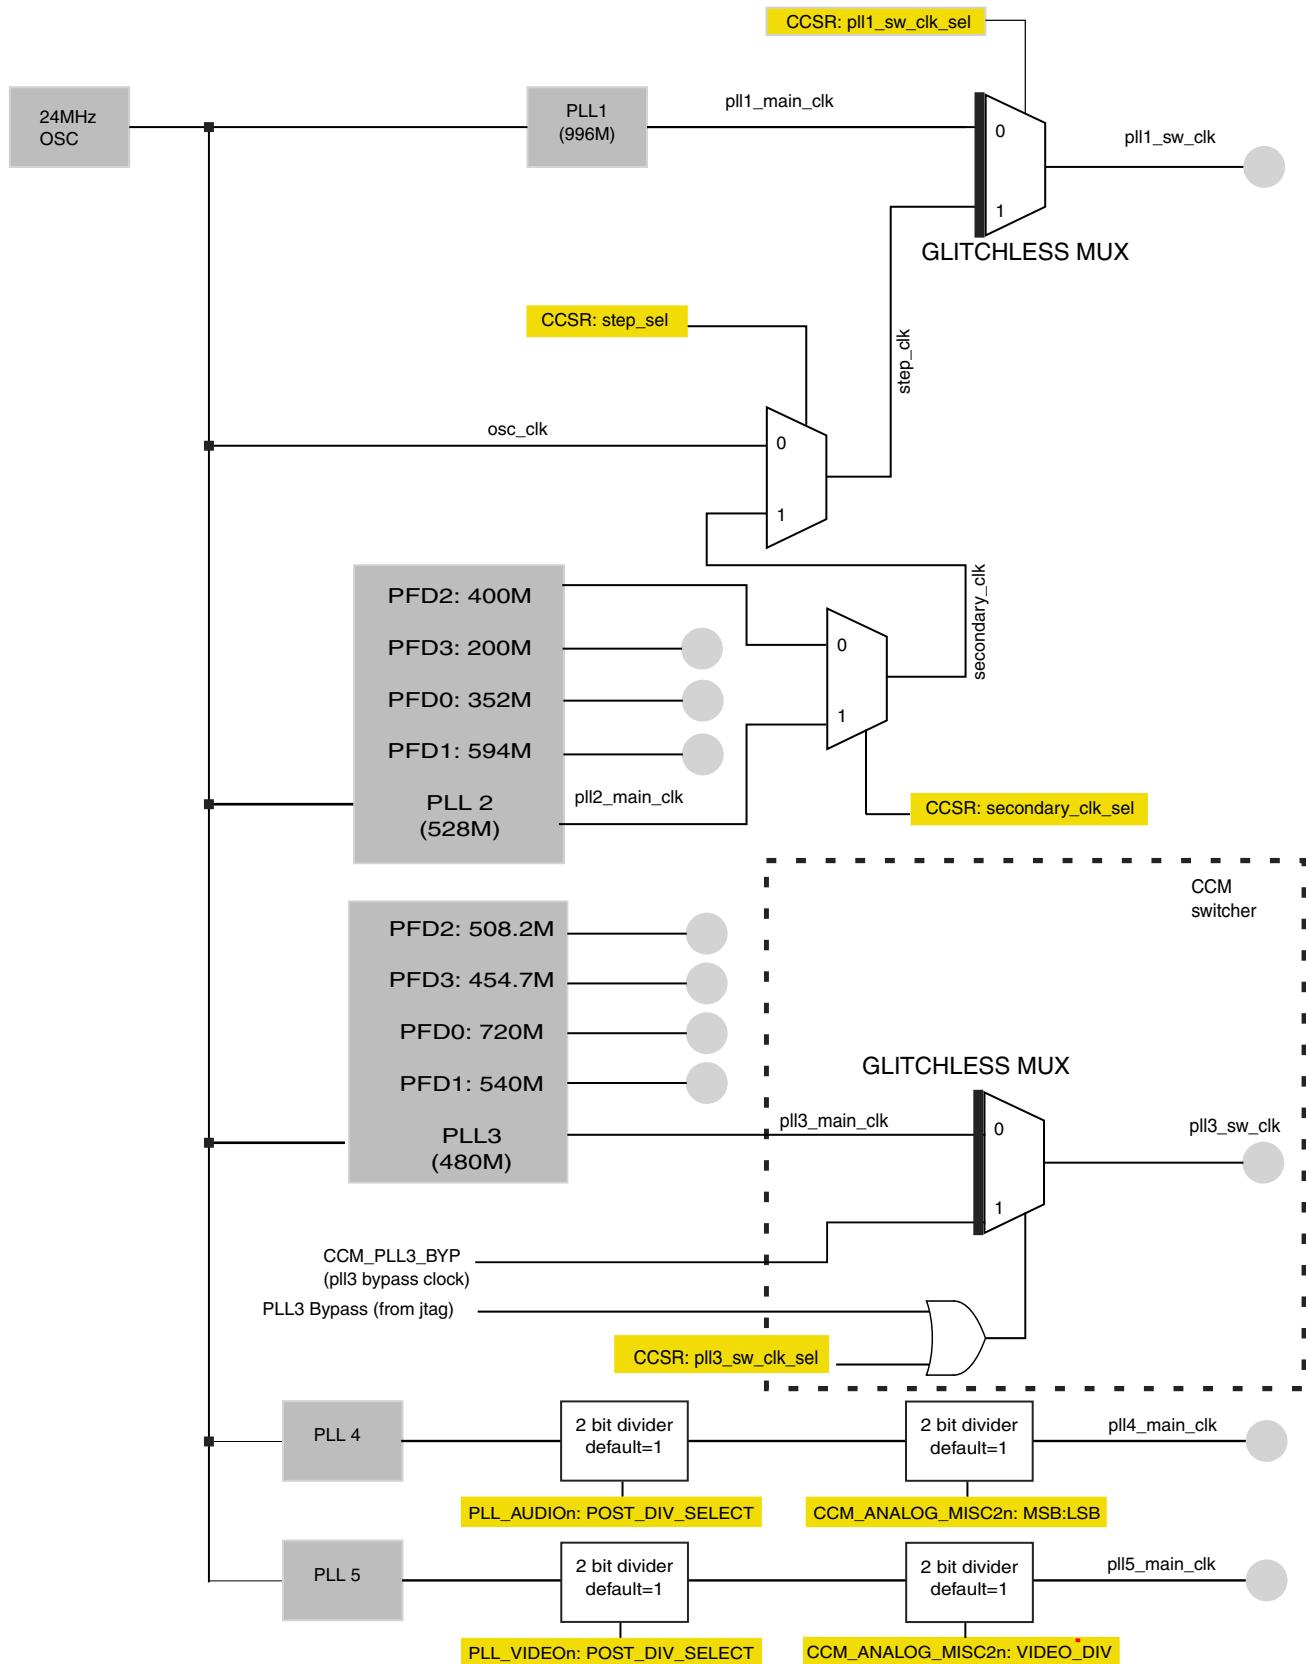

#### 18.5.1.5.1 Clock Switcher

The Clock Switcher (CCM\_CLK\_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 18-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

## Functional Description

**Figure 18-4. Switcher clock generation**

### 18.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM\_ANALOG module, switcher and clk\_root\_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

### 18.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

### 18.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM\_CLK\_ROOT\_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parentheses are the default typical frequencies.

## Functional Description

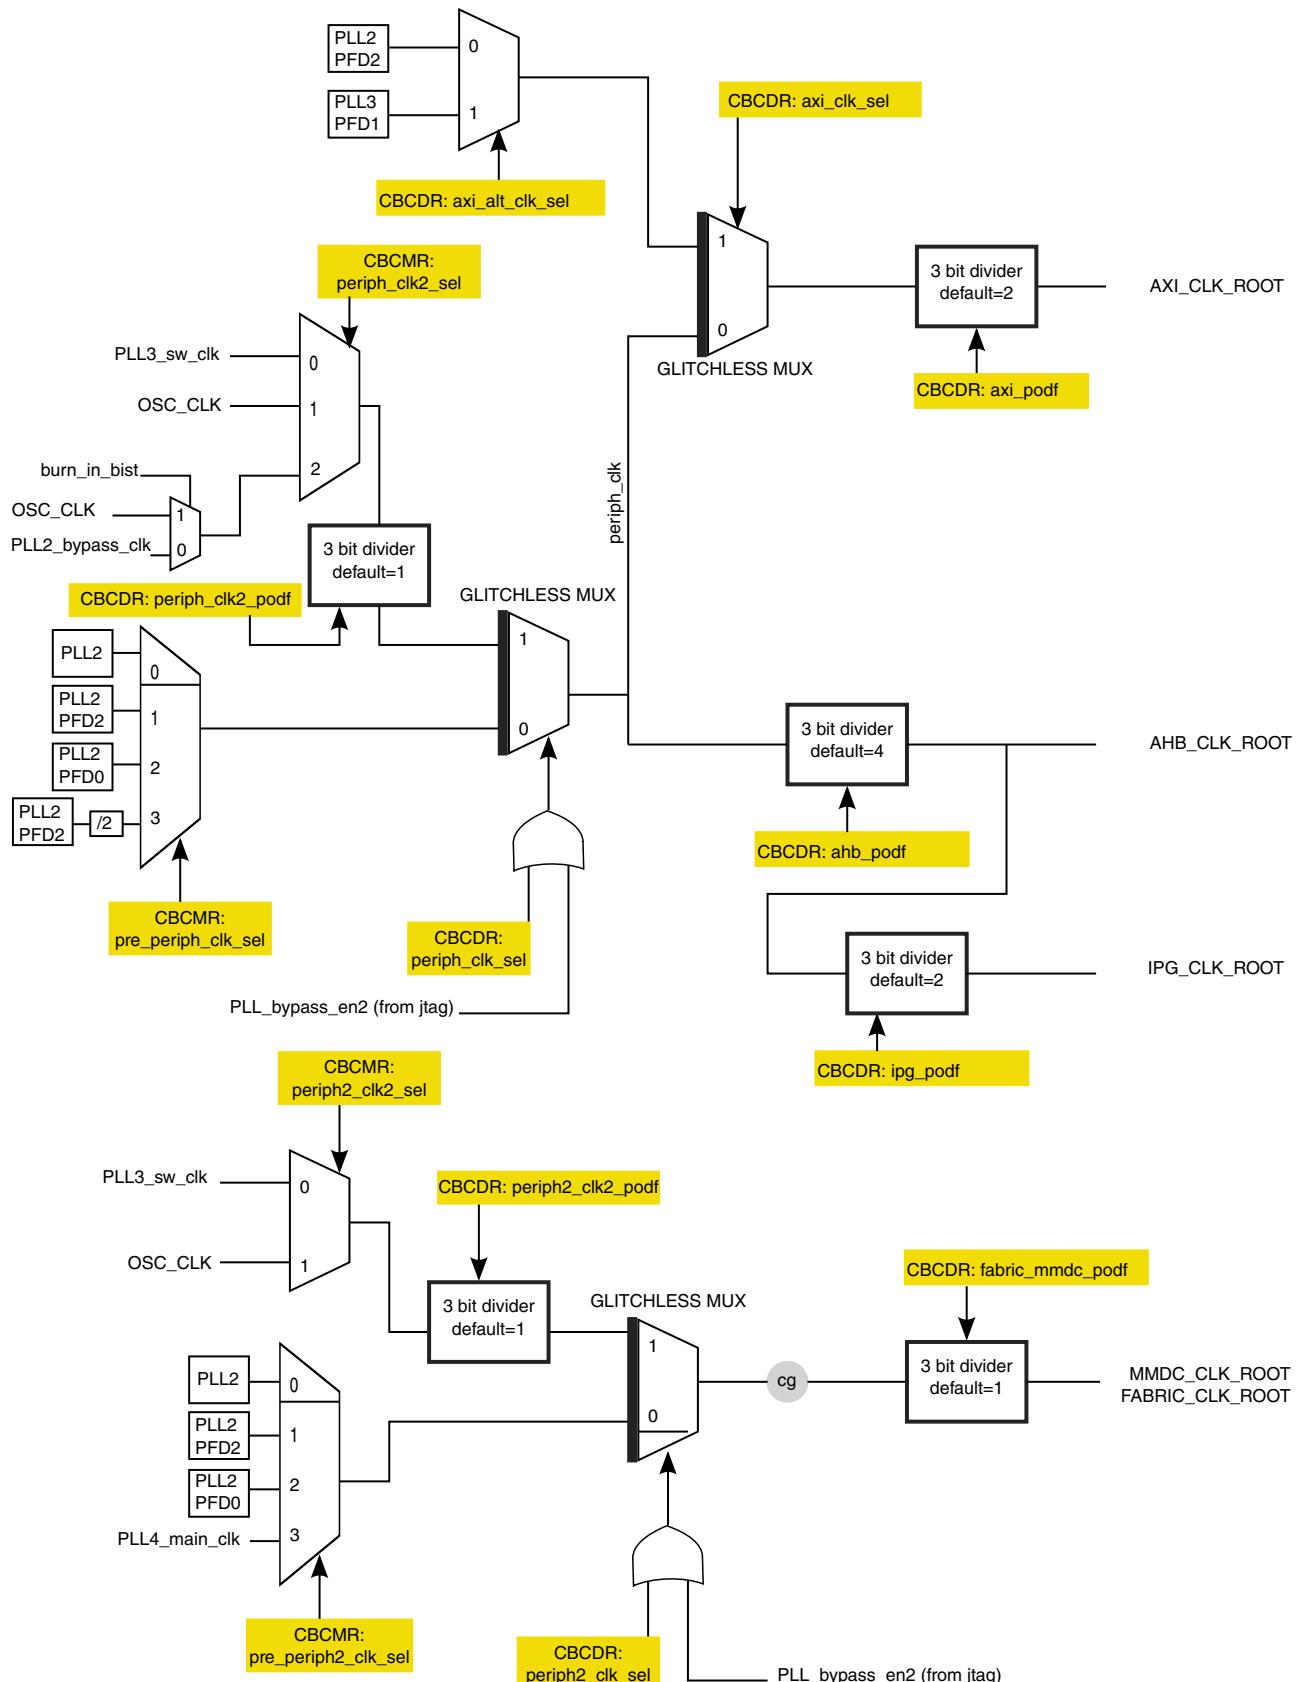

Figure 18-5. BUS clock generation

**NOTE**

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

**18.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).**

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programmability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init\_periph2\_clk2\_podf
- [1:0] init\_ipg\_podf
- [2:0] init\_ahb\_podf
- [2:0] init\_axi\_podf
- [2:0] init\_periph\_clk2\_podf
- init\_periph\_clk\_sel
- init\_periph2\_clk\_sel

**18.5.1.5.6 Divider change handshake**

Modifying the following dividers will start the handshake with MMDC.

- mmdc\_podf
- periph\_clk\_sel
- periph2\_clk\_sel
- arm\_podf
- ahb\_podf

The dividers listed above are designed with a handshake. For dividers without a handshake design, the following sequence must be performed when updating PODF value:

1. Gate the output clock off before updating PODF value.
2. Gate the output clock on after the PODF value is updated and stable.

To update the PODF value without gating the output clock off will cause unpredictable results such as no clock output.

### 18.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

### 18.5.1.7 Clock Switching Multiplexers

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM uses several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. For the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are five glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

**Table 18-5. Glitchless Multiplexers**

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
periph2_clk_mux	CBCDR[periph2_clk_sel]	CDHIPR[periph2_clk_sel_busy]
axi_alt_clk_mux	CBCDR[axi_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	
pll1_sw_clk_mux	CCSR[pll1_sw_clk_sel]	

#### NOTE

Any change of the periph\_clk\_sel and periph2\_clk\_sel sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 18-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the FABRIC\_CLK\_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH2\_CLK2\_SEL] and CBCDR[PERIPH2\_CLK2\_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH2\_CLK\_SEL].

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The output clocks to the mux are required to be gated before switching the source clock in the CCM clock mux. If the output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

### 18.5.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programmable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

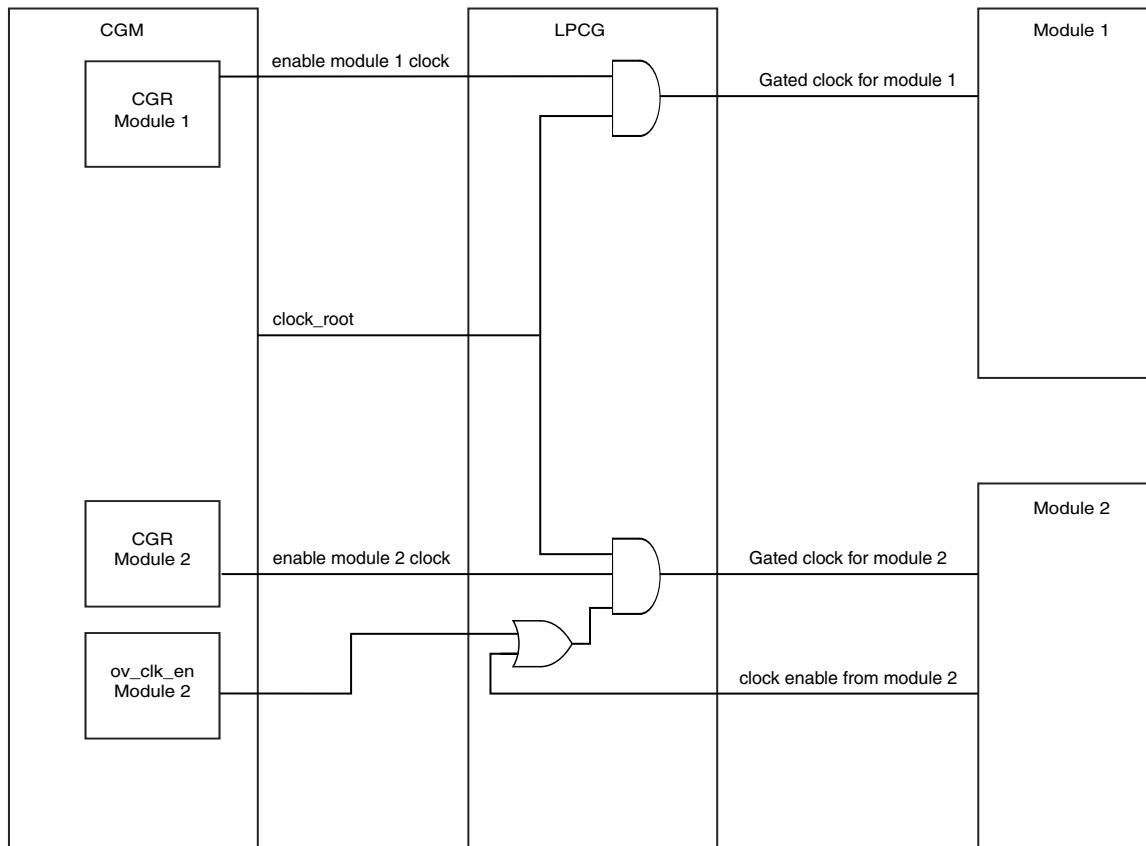

## Functional Description

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

**Figure 18-6. Clock split in LPCG**

### 18.5.1.9 MMDC handshake

CCM will assert the mmdc\_freq\_change\_req signal.

MMDC will assert the mmdc\_freq\_change\_ack signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of mmdc dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

**NOTE**

MMDC handshakes can be masked.

**NOTE**

Set register CCDR[17] to 1 before beginning any operation that initiates a handshake. It is acceptable to program and leave this override bit asserted.

## 18.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM\_ANALOG module.

**NOTE**

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

**NOTE**

CCM\_ANALOG will not control the voltage value in Bypass mode

## 18.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

### 18.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

### 18.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all ARM cores are in WFI, and L2 cache and SCU are idle.

#### 18.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

#### NOTE

Setting MMDC CGR bits to 01 can hang the entire system since the MMDC clock and fabric clock share the same clock root.

Any enabled interrupt assertion will start the exit from WAIT mode.

#### 18.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

### 18.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for ARM platform. External supply voltage can be reduced to decrease leakage.

#### 18.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM\_PMIC\_STBY\_REQ asserted, if vstby bit is set
- osc\_en signal is negated
- osc\_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after CCM\_PMIC\_STBY\_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop\_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP\_GPC until STOP mode is exited.

#### 18.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC\_STBY\_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref\_en\_b signal and deasserting cosc\_pwrdown signal respectively.
3. After the number of cycles of CKILs defined in stby\_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
4. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.

5. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
6. CCM will request GPC to restore ARM power by GPC\_PUP\_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC\_PUP\_ACK that power to ARM is back on, and it's safe to exit from STOP mode. Only then will the CCM progress to the next step.
7. Once assertion of notification from src that the resets for the power gated modules has been finished, (src\_power\_gating\_reset\_done is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continue to be gated.)

Once the system is in run mode, negate signals ccm\_ipg\_stop and system\_in\_stop\_mode.

## 18.6 CCM Memory Map/Register Definition

### NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at boot time](#) for more information.

## 18.6.1 CCM Control Register (CCM\_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C\_4000h base + 0h offset = 20C\_4000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R				0												0
W						RBC_EN										
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R				0	COSC_EN			0								OSCNT
W																
Reset	0	0	0	1	0	1	1	0	0	1	1	1	1	1	1	1

**CCM\_CCR field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNTER clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, even if counter is enabled.  1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_ COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode.  REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core.  000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip

*Table continues on the next page...*

**CCM\_CCR field descriptions (continued)**

Field	Description
	oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source. 0 disable on chip oscillator 1 enable on chip oscillator
11–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpll_ip to use and only then the gate in dpll_ip can be opened.  0000000 count 1 ckil 1111111 count 128 ckil's

**18.6.2 CCM Control Divider Register (CCM\_CCDR)**

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C\_4000h base + 4h offset = 20C\_4004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R									0							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R									0							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

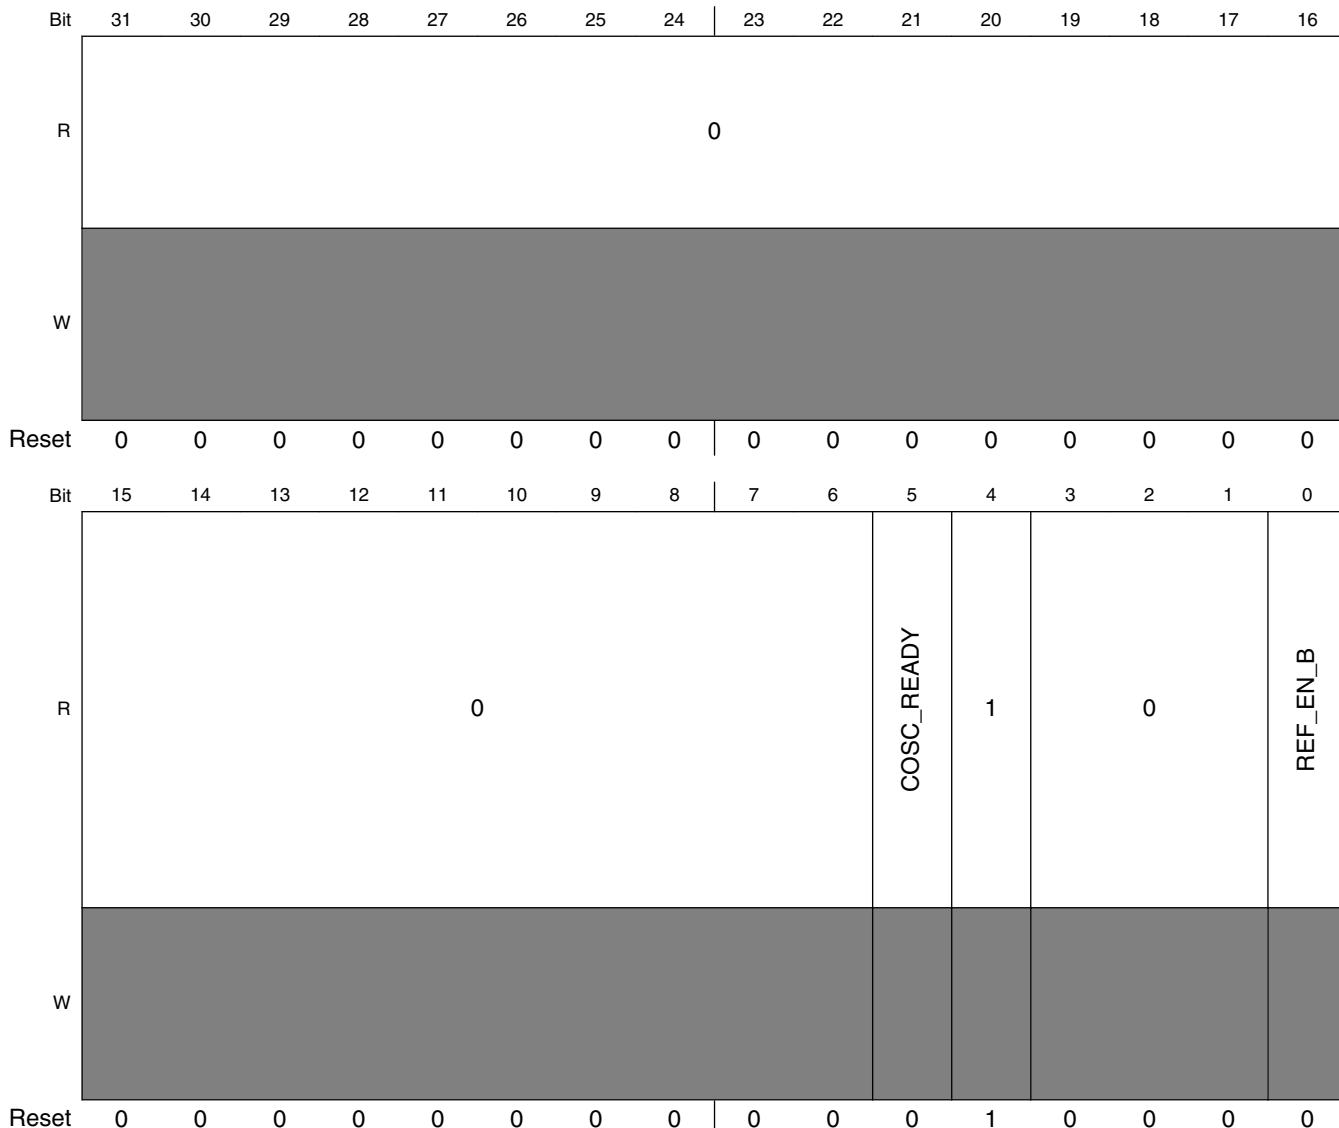

**CCM\_CCDR field descriptions**

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 MMDC_CH0_ MASK	During divider ratio mmdc_ch0_axi_podf change or sync mux periph_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch0 module. 0 allow handshake with mmdc_ch0 module 1 mask handshake with mmdc_ch0. Request signal will not be generated.
16 MMDC_CH1_ MASK	During divider ratio mmdc_ch1_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc_ch1 module. 0 Allow handshake with mmdc_ch1 module. 1 Mask handshake with mmdc_ch1. Request signal will not be generated.
Reserved	This read-only field is reserved and always has the value 0.

### 18.6.3 CCM Status Register (CCM\_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C\_4000h base + 8h offset = 20C\_4008h

**CCM\_CSR field descriptions**

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

*Table continues on the next page...*

**CCM\_CSR field descriptions (continued)**

Field	Description
5 COSC_READY	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting.  0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm  0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

**18.6.4 CCM Clock Switcher Register (CCM\_CCSR)**

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C\_4000h base + Ch offset = 20C\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**CCM\_CCSR field descriptions**

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 STEP_SEL	Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk.  <b>NOTE:</b> This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used.  0 derive clock from osc_clk (24M) - source for lp_apm. 1 derive clock from secondary_clk
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 SECONDARY_CLK_SEL	Select source to generate secondary_clk 0 PLL2 PFD2 (400 M) 1 PLL2 (528 M)
2 PLL1_SW_CLK_SEL	Selects source to generate pll1_sw_clk. 0 pll1_main_clk 1 step_clk
1 -	This field is reserved. Reserved
0 PLL3_SW_CLK_SEL	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

**18.6.5 CCM Arm Clock Root Register (CCM\_CACRR)**

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C\_4000h base + 10h offset = 20C\_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PERIPH2_CLK2_PODF	<p>Divider for periph2_clk2 podf.</p> <p><b>NOTE:</b> Divider should be updated when output clock is gated.</p> <p>000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8</p>

## 18.6.7 CCM Bus Clock Multiplexer Register (CCM\_CBCMR)

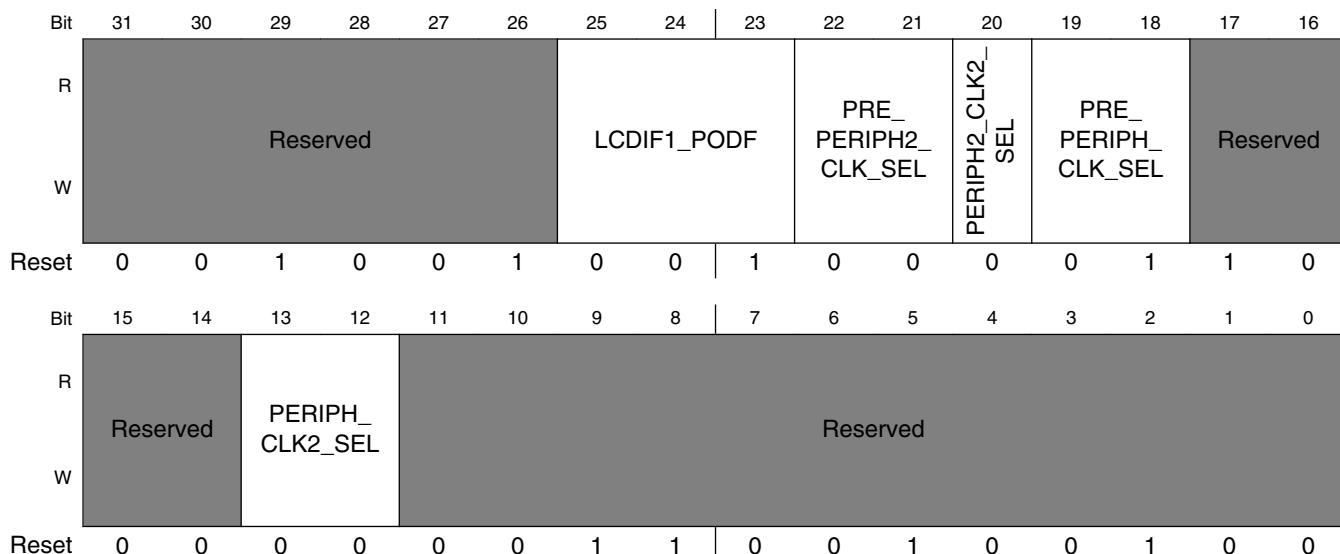

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

### NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm\_clk\_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

Address: 20C\_4000h base + 18h offset = 20C\_4018h

### 18.6.17 CCM Divider Handshake In-Process Register (CCM\_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

Address: 20C\_4000h base + 48h offset = 20C\_4048h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R									0							
W	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset 0 0 0 0 0 0 0 | 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

**CCM\_CDHIPR field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 ARM_PODF_ BUSY	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 PERIPH_CLK_ SEL_BUSY	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 -	This field is reserved. Reserved

*Table continues on the next page...*

**CCM\_CDHIPR field descriptions (continued)**

Field	Description
3 PERIPH2_CLK_SEL_BUSY	Busy indicator for periph2_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.
2 MMDC_PODF_BUSY	Busy indicator for mmdc_axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_axi_podf will be applied.
1 AHB_PODF_BUSY	Busy indicator for ahb_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.
0 AXI_PODF_BUSY	Busy indicator for axi_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the axi_podf will be applied.

## 18.6.18 CCM Low Power Control Register (CCM\_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation. The table below provides its field descriptions.

Address: 20C\_4000h base + 54h offset = 20C\_4054h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R					0	MASK_L2CC_IDLE	MASK_SCU_IDLE		0	MASK_CORE0_WFI	BYPASS_MMDC_CH1_LPM_HS	0	BYPASS_MMDC_CH0_LPM_HS			
W																Reserved
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

W																
Reset	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1

**CCM\_CLPCR field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 MASK_L2CC_IDLE	Mask L2CC IDLE for entering low power mode. <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 MASK_SCU_IDLE	Mask SCU IDLE for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

**CCM\_CLPCR field descriptions (continued)**

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 MASK_CORE0_WFI	Mask WFI of core0 for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 BYPASS_MMDC_CH1_LPM_HS	Bypass handshake with mmdc_ch1 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. 0 Handshake with mmdc_ch1 on next entrance to low power mode will be performed. 1 Handshake with mmdc_ch1 on next entrance to low power mode will be bypassed.
20 Reserved	This read-only field is reserved and always has the value 0.
19 BYPASS_MMDC_CH0_LPM_HS	Bypass handshake with mmdc_ch0 on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake will also be bypassed, if CGR3 CG10 is set to gate fast mmdc_ch0 clock. <b>NOTE:</b> MMDC_CH0 clock is not used. This bit should always be programmed HIGH to let CCM know not to wait for the acknowledge from MMDC_CH0, due to no connection. 0 Handshake with mmdc_ch0 on next entrance to low power mode will be performed. 1 Handshake with mmdc_ch0 on next entrance to low power mode will be bypassed.
18–12 -	This field is reserved. Reserved
11 COSC_PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). <b>NOTE:</b> Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode. 0 Voltage will not be changed to standby voltage after next entrance to STOP mode. ( PMIC_STBY_REQ will remain negated - '0' ) 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. ( PMIC_STBY_REQ will be asserted - '1').

*Table continues on the next page...*

**CCM\_CLPCR field descriptions (continued)**

Field	Description
7 DIS_REF_OSC	<p>dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed.</p> <p>The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation.</p> <p><b>NOTE:</b> When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits.</p> <p>0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'</p>
6 SBYOS	<p>Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator.</p> <p>0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.</p>
5 ARM_CLK_DIS_ON_LPM	<p>Define if ARM clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning.</p> <p><b>NOTE:</b> Software should not enable ARM power gating in wait mode if this bit is cleared.</p> <p>0 ARM clock enabled on wait mode. 1 ARM clock disabled on wait mode. .</p>
4–3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	<p>Setting the low power mode that system will enter on next assertion of dsm_request signal.</p> <p>00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved</p>

**18.6.19 CCM Interrupt Status Register (CCM\_CISR)**

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

**NOTE**

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

**CCM\_CISR field descriptions**

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26 ARM_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of arm_podf. The interrupt will commence only if arm_podf is loaded during a DVFS operation. 0 interrupt is not generated due to frequency change of arm_podf 1 interrupt generated due to frequency change of arm_podf
25–24 Reserved	This read-only field is reserved and always has the value 0.
23 -	This field is reserved. Reserved
22 PERIPH_CLK_ SEL_LOADED	CCM interrupt request 1 generated due to update of periph_clk_sel. 0 interrupt is not generated due to update of periph_clk_sel. 1 interrupt generated due to update of periph_clk_sel.
21 MMDC_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of mmdc_podf_loaded 0 interrupt is not generated due to frequency change of mmdc_podf_loaded 1 interrupt generated due to frequency change of mmdc_podf_loaded
20 AHB_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of ahb_podf 0 interrupt is not generated due to frequency change of ahb_podf 1 interrupt generated due to frequency change of ahb_podf
19 PERIPH2_CLK_ SEL_LOADED	CCM interrupt request 1 generated due to frequency change of periph2_clk_sel 0 interrupt is not generated due to frequency change of periph2_clk_sel 1 interrupt generated due to frequency change of periph2_clk_sel
18 -	This field is reserved. Reserved
17 AXI_PODF_ LOADED	CCM interrupt request 1 generated due to frequency change of axi_podf 0 interrupt is not generated due to frequency change of axi_podf 1 interrupt generated due to frequency change of axi_podf
16–7 Reserved	This read-only field is reserved and always has the value 0.
6 COSC_READY	CCM interrupt request 2 generated due to on board oscillator ready, i.e. oscnt has finished counting. 0 interrupt is not generated due to on board oscillator ready 1 interrupt generated due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 0.
0 LRF_PLL	CCM interrupt request 2 generated due to lock of all enabled and not bypassed PLLs 0 interrupt is not generated due to lock ready of all enabled and not bypassed PLLs 1 interrupt generated due to lock ready of all enabled and not bypassed PLLs

## 18.6.20 CCM Interrupt Mask Register (CCM\_CIMR)

The figure below represents the CCM Interrupt Mask Register (CIMR). The table below provides its field descriptions.

Address: 20C\_4000h base + 5Ch offset = 20C\_405Ch

**CCM\_CIMR field descriptions**

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 1.
26 ARM_PODF_LOADED	mask interrupt generation due to frequency change of arm_podf 0 don't mask interrupt due to frequency change of arm_podf - interrupt will be created 1 mask interrupt due to frequency change of arm_podf
25–23 -	This field is reserved. Reserved
22 MASK_PERIPH_CLK_SEL_LOADED	mask interrupt generation due to update of periph_clk_sel. 0 don't mask interrupt due to update of periph_clk_sel - interrupt will be created 1 mask interrupt due to update of periph_clk_sel

*Table continues on the next page...*

**CCM\_CIMR field descriptions (continued)**

Field	Description
21 MASK_MMDC_ PODF_LOADED	mask interrupt generation due to update of mask_mmddc_podf 0 don't mask interrupt due to update of mask_mmddc_podf - interrupt will be created 1 mask interrupt due to update of mask_mmddc_podf
20 MASK_AHB_ PODF_LOADED	mask interrupt generation due to frequency change of ahb_podf 0 don't mask interrupt due to frequency change of ahb_podf - interrupt will be created 1 mask interrupt due to frequency change of ahb_podf
19 MASK_ PERIPH2_CLK_ SEL_LOADED	mask interrupt generation due to update of periph2_clk_sel. 0 don't mask interrupt due to update of periph2_clk_sel - interrupt will be created 1 mask interrupt due to update of periph2_clk_sel
18 -	This field is reserved. Reserved
17 MASK_AXI_ PODF_LOADED	mask interrupt generation due to frequency change of axi_podf 0 don't mask interrupt due to frequency change of axi_podf - interrupt will be created 1 mask interrupt due to frequency change of axi_podf
16–7 Reserved	This read-only field is reserved and always has the value 1.
6 MASK_COSC_ READY	mask interrupt generation due to on board oscillator ready 0 don't mask interrupt due to on board oscillator ready - interrupt will be created 1 mask interrupt due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 1.
0 MASK_LRF_PLL	mask interrupt generation due to lrf of PLLs 0 don't mask interrupt due to lrf of PLLs - interrupt will be created 1 mask interrupt due to lrf of PLLs

### 18.6.21 CCM Clock Output Source Register (CCM\_CCOSR)

The figure below represents the CCM Clock Output Source Register (CCOSR). The CCOSR register contains bits to control the clock that will be generated on the output `ipp_do_clko1` (CCM\_CLKO). The table below provides its field descriptions.

Address: 20C\_4000h base + 60h offset = 20C\_4060h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R				0					CLKO2_EN								
W										CLKO2_DIV				CLKO2_SEL			
Reset	0	0	0	0	0	0	0	0		0	0	0	0	1	0	1	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0

**CCM\_CGPR field descriptions**

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode.

*Table continues on the next page...*

**CCM\_CGPR field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry.</p> <ul style="list-style-type: none"> <li>0 Disable the clock to the ARM platform memories when entering Low Power Mode</li> <li>1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)</li> </ul>
16 FPL	<p>Fast PLL enable.</p> <ul style="list-style-type: none"> <li>0 Engage PLL enable default way.</li> <li>1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.</li> </ul>
15–14 SYS_MEM_DS_CTRL	<p>System memory DS control</p> <ul style="list-style-type: none"> <li>00 Disable memory DS mode always</li> <li>01 Enable memory (outside ARM platform) DS mode when system STOP and PLL are disabled</li> <li>1x enable memory (outside ARM platform) DS mode when system is in STOP mode</li> </ul>
13–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 EFUSE_PROG_SUPPLY_GATE	<p>Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing</p> <ul style="list-style-type: none"> <li>0 fuse programing supply voltage is gated off to the efuse module</li> <li>1 allow fuse programing.</li> </ul>
3 -	This field is reserved. Reserved
2 MMDC_EXT_CLK_DIS	<p>Disable external clock driver of MMDC during STOP mode</p> <ul style="list-style-type: none"> <li>1 disable during stop mode</li> <li>0 don't disable during stop mode.</li> </ul>
1 -	Reserved. Keep default value set to '1' for proper operation.
0 PMIC_DELAY_SCALER	<p>Defines clock division of clock for stby_count (pmic delay counter)</p> <ul style="list-style-type: none"> <li>0 clock is not divided</li> <li>1 clock is divided /8</li> </ul>

**18.6.23 CCM Clock Gating Register 0 (CCM\_CCGR0)**

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM\_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C\_4000h base + 68h offset = 20C\_4068h

### CCM\_CCGR5 field descriptions

Field	Description
31–30 CG15	sai2 clock (sai2_clk_enable)
29–28 CG14	sai1 clock (sai1_clk_enable)
27–26 CG13	uart7 clock (uart7_clk_enable)
25–24 CG12	uart1 clock (uart1_clk_enable)
23–22 CG11	sai3 clock (sai3_clk_enable)
21–20 CG10	snvs_lp clock (snvs_lp_clk_enable)
19–18 CG9	snvs_hp clock (snvs_hp_clk_enable)
17–16 CG8	sim_main clock (sim_main_clk_enable)
15–14 CG7	spdif / audio clock (spdif_clk_enable, audio_clk_root)
13–12 CG6	spba clock (spba_clk_enable)
11–10 CG5	wdog2 clock (wdog2_clk_enable)
9–8 CG4	kpp clock (kpp_clk_enable)

Table continues on the next page...

**CCM\_CCGR5 field descriptions (continued)**

Field	Description
7–6 CG3	sdma clock (sdma_clk_enable)
5–4 CG2	snvs dryice clock (snvs_dryice_clk_enable)
3–2 CG1	sctr clock (sctr_clk_enable)
CG0	rom clock (rom_clk_enable)

**18.6.29 CCM Clock Gating Register 6 (CCM\_CCGR6)**

The figure below represents the CCM Clock Gating Register 6 (CCM\_CCGR6). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 8 CGR registers. The number of registers required is determined by the number of peripherals in the system.

Address: 20C\_4000h base + 80h offset = 20C\_4080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	CG15		CG14		CG13		CG12		CG11		CG10		CG9		CG8	
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	CG7		CG6		CG5		CG4		CG3		CG2		CG1		CG0	
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

**CCM\_CCGR6 field descriptions**

Field	Description
31–30 CG15	pwm7 clocks (pwm7_clk_enable)
29–28 CG14	pwm6 clocks (pwm6_clk_enable)
27–26 CG13	pwm5 clocks (pwm5_clk_enable)
25–24 CG12	i2c4 serial clock (i2c4_serial_clk_enable)
23–22 CG11	anadig clocks (anadig_clk_enable)
21–20 CG10	wdog3 clock (wdog3_clk_enable)
19–18 CG9	aips_tz3 clock (aips_tz3_clk_enable)

Table continues on the next page...

**CCM\_CCGR6 field descriptions (continued)**

Field	Description
17–16 CG8	pwm8 clocks (pwm8_clk_enable)
15–14 CG7	uart8 clocks (uart8_clk_enable)
13–12 CG6	uart debug req gate <b>NOTE:</b> This is not a clock, but a gate for the debug request signal to reach the UART module.
11–10 CG5	eim_slow clocks (eim_slow_clk_enable)
9–8 CG4	ipmux4 clock (ipmux4_clk_enable)
7–6 CG3	Reserved
5–4 CG2	usdhc2 clocks (usdhc2_clk_enable)
3–2 CG1	usdhc1 clocks (usdhc1_clk_enable)
CG0	usboh3 clock (usboh3_clk_enable)

### 18.6.30 CCM Module Enable Override Register (CCM\_CMEOR)

The follow figure represents the CCM Module Enable Override Register (CMEOR). The CMEOR register contains bits to override the clock enable signal from the module. This bit will be applicable only for modules whose clock enable signals are used. The following table provides its field descriptions.

Address: 20C\_4000h base + 88h offset = 20C\_4088h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	1	MOD_EN_OV_ CAN1_CPI	1	MOD_EN_OV_ CAN2_CPI							1

Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R									MOD_EN_USDHC	MOD_EN_OV_ EPIT	MOD_EN_OV_GPT				1	
W																
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

#### CCM\_CMEOR field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 1.
30 MOD_EN_OV_ CAN1_CPI	Override clock enable signal from CAN1 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
29 Reserved	This read-only field is reserved and always has the value 1.
28 MOD_EN_OV_ CAN2_CPI	Override clock enable signal from CAN2 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
27–8 Reserved	This read-only field is reserved and always has the value 1.

Table continues on the next page...

**CCM\_CMEOR field descriptions (continued)**

Field	Description
7 MOD_EN_ USDHC	override clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 MOD_EN_OV_ EPIT	Override clock enable signal from EPIT - clock will not be gated based on EPIT's signal 'ipg_enable_clk'. 0 don't override module enable signal 1 override module enable signal
5 MOD_EN_OV_ GPT	Override clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk'. 0 don't override module enable signal 1 override module enable signal
Reserved	This read-only field is reserved and always has the value 1.

## 18.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

**CCM\_ANALOG memory map**

### 18.7.1 Analog ARM PLL control Register (CCM\_ANALOG\_PLL\_ARMn)

The control register provides control for the system PLL.

Address: 20C\_8000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK								-				PLL_SEL			
W													Reserved			BYPASS
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
	BYPASS_CLK_SRC	ENABLE	POWERDOWN											DIV_SELECT		
W																
Reset	0	0	1	1	0	0	0	0	0	1	1	0	0	0	1	1

#### CCM\_ANALOG\_PLL\_ARMn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved

Table continues on the next page...

**CCM\_ANALOG\_PLL\_ARMn field descriptions (continued)**

Field	Description
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source.  <b>NOTE:</b> Changing the Bypass clock source also changes the PLL reference clock source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * \text{div\_select}/2.0$ .

## 18.7.2 Analog USB1 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C\_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK								-							BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	BYPASS_CLK_SRC	ENABLE		POWER			-		EN_USB_CLKS		-					DIV_SELECT
W																
Reset	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0

**CCM\_ANALOG\_PLL\_USB1n field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_USB1n field descriptions (continued)**

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>GPANAIO</b> — 0x3 <b>CHRG_DET_B</b> —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs.  0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 18.7.3 Analog USB2 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 20C\_8000h base + 20h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK								-							BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	BYPASS_CLK_SRC	ENABLE		POWER			-		EN_USB_CLKS		-					DIV_SELECT
W																
Reset	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0

**CCM\_ANALOG\_PLL\_USB2n field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_USB2n field descriptions (continued)**

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL).This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 18.7.4 Analog System PLL Control Register (CCM\_ANALOG\_PLL\_SYSn)

The control register provides control for the 528MHz PLL.

Address: 20C\_8000h base + 30h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK							-						PFD_OFFSET_EN	Reserved	BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R															-	
	BYPASS_CLK_SRC	ENABLE		POWERDOWN											DIV_SELECT	
W																
Reset	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	1

**CCM\_ANALOG\_PLL\_SYSn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>GPANAIO</b> — 0x3 <b>CHRG_DET_B</b> —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

## 18.7.5 528MHz System PLL Spread Spectrum Register (CCM\_ANALOG\_PLL\_SYS\_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 20C\_8000h base + 40h offset = 20C\_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ENABLE															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### CCM\_ANALOG\_PLL\_SYS\_SS field descriptions

Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	Enable bit 0 — Spread spectrum modulation disabled 1 — Spread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

## 18.7.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_NUM)

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator

Address: 20C\_8000h base + 50h offset = 20C\_8050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	-																A															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

#### CCM\_ANALOG\_PLL\_SYS\_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

### 18.7.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_DENOM)

This register contains the Denominator of 528MHz PLL fractional loop divider.

Address: 20C\_8000h base + 60h offset = 20C\_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	-																B															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0

#### CCM\_ANALOG\_PLL\_SYS\_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator (B) of fractional loop divider (unsigned integer).

## 18.7.8 Analog Audio PLL control Register (CCM\_ANALOG\_PLL\_AUDIO*n*)

The control register provides control for the audio PLL.

Address: 20C\_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK							-			Reserved	POST_DIV_SELECT	PFD_OFFSET_EN	Reserved	Reserved	BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
	BYPASS_CLK_SRC		ENABLE		POWERDOWN				Reserved				DIV_SELECT			
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1	0

**CCM\_ANALOG\_PLL\_AUDION field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reversed
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —

*Table continues on the next page...*

**CCM\_ANALOG\_PLL\_AUDIOn field descriptions (continued)**

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

### 18.7.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider.(Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C\_8000h base + 80h offset = 20C\_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CCM\_ANALOG\_PLL\_VIDEOOn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Revserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —

*Table continues on the next page...*

**CCM\_ANALOG\_PLL\_VIDEOOn field descriptions (continued)**

Field	Description
13 ENABLE	Enalbe PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

### 18.7.12 Numerator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_NUM)

This register contains the numerator (A) of Video PLL fractional loop divider.(Signed number)

Absolute value should be less than denominator

Address: 20C\_8000h base + B0h offset = 20C\_80B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### CCM\_ANALOG\_PLL\_VIDEO\_DENOM field descriptions

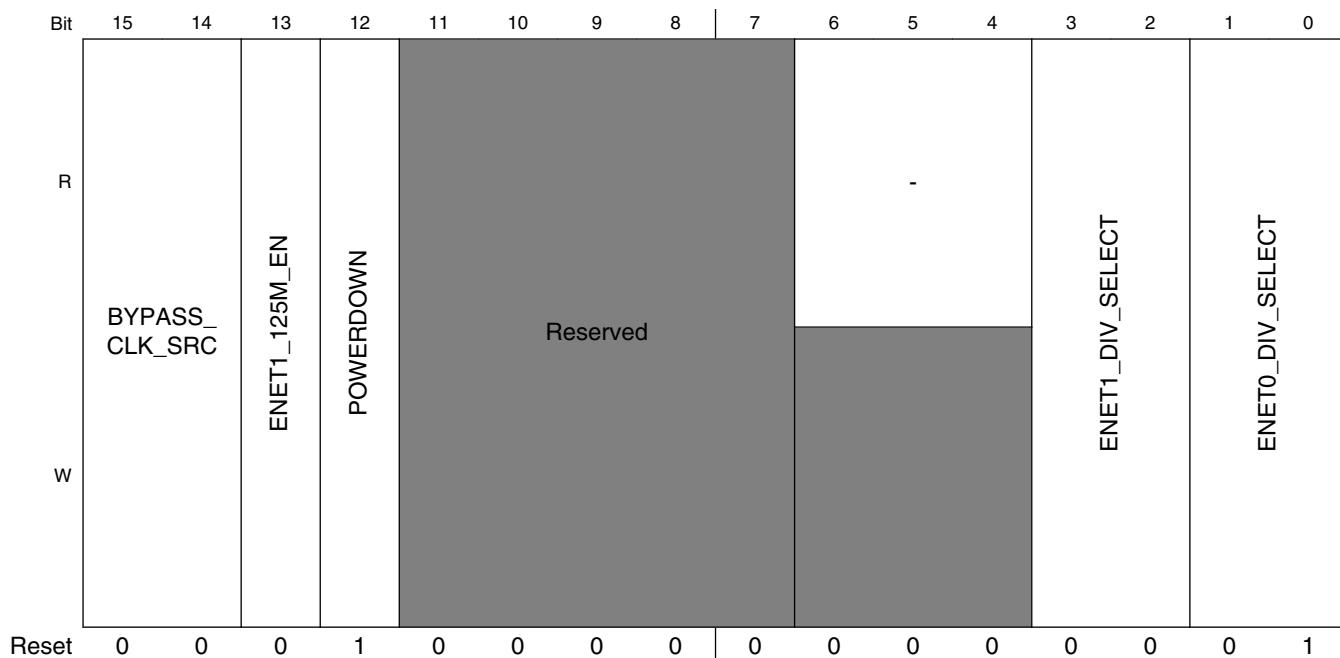

Field	Description
31–30	Always set to zero (0).
-	
B	30 bit Denominator of fractional loop divider.

### 18.7.14 Analog ENET PLL Control Register (CCM\_ANALOG\_PLL\_ENETn)

The control register provides control for the ENET PLL.

Address: 20C\_8000h base + E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK							-			ENET_25M_REF_EN	ENET2_125M_EN	ENABLE_125M	PFD_OFFSET_EN	Reserved	BYPASS
W											0	0	0	0	0	1
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**CCM\_ANALOG\_PLL\_ENETn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 ENET_25M_ REF_EN	Enable the PLL providing ENET 25 MHz reference clock
20 ENET2_125M_ EN	Enable the PLL providing the ENET2 125 MHz reference clock
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved</b> — 0x3 <b>Reserved</b> —

*Table continues on the next page...*

**CCM\_ANALOG\_PLL\_ENETn field descriptions (continued)**

Field	Description
13 ENET1_125M_ EN	Enable the PLL providing the ENET1 125 MHz reference clock.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–4 -	Always set to zero (0).
3–2 ENET1_DIV_ SELECT	Controls the frequency of the ethernet1 reference clock.  00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz
ENET0_DIV_ SELECT	Controls the frequency of the ethernet0 reference clock.  00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz

### 18.7.15 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_480n)

The PFD\_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C\_8000h base + F0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### CCM\_ANALOG\_PFD\_480n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

*Table continues on the next page...*

**CCM\_ANALOG\_PFD\_480n field descriptions (continued)**

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480*18/\text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480*18/\text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480*18/\text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480*18/\text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

### 18.7.16 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_528n)

The PFD\_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 20C\_8000h base + 100h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	1	0	0	0	0	0	0	0	1	1	0	1	1

### CCM\_ANALOG\_PFD\_528n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

*Table continues on the next page...*

**CCM\_ANALOG\_PFD\_528n field descriptions (continued)**

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528*18/\text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528*18/\text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.  <b>NOTE:</b> The maximum allowed frequency of PFD2 is 400MHz
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528*18/\text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528*18/\text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.  <b>NOTE:</b> For QSPI boot at 76 MHz, this PFD is relocked to 307MHz, so the default value for this field (modified by ROM) would be 0x1f. Also for Low Freq Boot, ROM will relock this PFD to 307MHz, hence default would be 0x1f.

### 18.7.17 Miscellaneous Register 0 (CCM\_ANALOG\_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C\_8000h base + 150h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**CCM\_ANALOG\_MISC0n field descriptions**

Field	Description
31 VID_PLL_ PREDIV	Predivider for the source clock of the PLL's.  0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>
29 RTC_XTAL_ SOURCE	This field indicates which chip source is being used for the rtc clock.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>  0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block.  <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>  000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block.  <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>  0 <b>ALLOW_AUTO_GATE</b> — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 <b>NO_AUTO_GATE</b> — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>

*Table continues on the next page...*

## CCM\_ANALOG\_MISC0n field descriptions (continued)

Field	Description
14–13 OSC_I	<p>This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p> <ul style="list-style-type: none"> <li>00 <b>NOMINAL</b> — Nominal</li> <li>01 <b>MINUS_12_5_PERCENT</b> — Decrease current by 12.5%</li> <li>10 <b>MINUS_25_PERCENT</b> — Decrease current by 25.0%</li> <li>11 <b>MINUS_37_5_PERCENT</b> — Decrease current by 37.5%</li> </ul>
12 DISCON_HIGH_ SNVS	<p>This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.</p> <ul style="list-style-type: none"> <li>0 Turn on the switch</li> <li>1 Turn off the switch</li> </ul>
11–10 STOP_MODE_ CONFIG	<p>Configure the analog behavior in stop mode.</p> <ul style="list-style-type: none"> <li>00 All analog except rtc powered down on stop mode assertion. XtalOsc=on, RCOsc=off;</li> <li>01 Certain analog functions such as certain regulators left up. XtalOsc=on, RCOsc=off;</li> <li>10 XtalOsc=off, RCOsc=on, Old BG=on, New BG=off.</li> <li>11 XtalOsc=off, RCOsc=on, Old BG=off, New BG=on.</li> </ul>
9–8 -	<p>This field is reserved.</p> <p>Reserved</p>
7 REFTOP_ VBGUP	<p>Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
6–4 REFTOP_ VBGADJ	<p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <ul style="list-style-type: none"> <li>000 Nominal VBG</li> <li>001 VBG+0.78%</li> <li>010 VBG+1.56%</li> <li>011 VBG+2.34%</li> <li>100 VBG-0.78%</li> <li>101 VBG-1.56%</li> <li>110 VBG-2.34%</li> <li>111 VBG-3.12%</li> </ul>
3 REFTOP_ SELFBIASOFF	<p>Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.</p> <p><b>NOTE:</b> Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <ul style="list-style-type: none"> <li>0 Uses coarse bias currents for startup</li> <li>1 Uses bandgap-based bias currents for best performance.</li> </ul>
2–1 -	<p>This field is reserved.</p>

Table continues on the next page...

**CCM\_ANALOG\_MISC0n field descriptions (continued)**

Field	Description
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry.  <b>NOTE:</b> A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>

### 18.7.18 Miscellaneous Register 1 (CCM\_ANALOG\_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C\_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	IRQ_DIG_BO	IRQ_ANA_BO	IRQ_TEMPHIGH	IRQ_TEMPLLOW	IRQ_TEMPPANIC											
W	w1c	w1c	w1c	w1c	w1c										PFD_528_AUTOGATE_EN	PFD_480_AUTOGATE_EN

Reset 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W																

Reset 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

**CCM\_ANALOG\_MISC1n field descriptions**

Field	Description
31 IRQ_DIG_BO	This status bit is set to one when any of the digital regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
30 IRQ_ANA_BO	This status bit is set to one when any of the analog regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
29 IRQ_TEMPHIGH	This status bit is set to one when the temperature sensor high interrupt asserts for high temperature.  <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
28 IRQ_TEMPLOW	This status bit is set to one when the temperature sensor low interrupt asserts for low temperature.  <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
27 IRQ_TEMPPANIC	This status bit is set to one when the temperature sensor panic interrupt asserts for a panic high temperature.  <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
26–18 -	This field is reserved. Reserved
17 PFD_528_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_528 clocks anytime the PLL_528 is unlocked or powered off.
16 PFD_480_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_480 clocks anytime the USB1_PLL_480 is unlocked or powered off.
15–14 -	This field is reserved. Reserved
13 -	This field is reserved. Reserved
12 LVDSCLK1_ IBEN	This enables the LVDS input buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
11 -	This field is reserved. Reserved
10 LVDSCLK1_ OBEN	This enables the LVDS output buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
9–5 -	This field is reserved. Reserved
LVDS1_CLK_ SEL	This field selects the clk to be routed to anaclk1/1b.  00000 <b>ARM_PLL</b> — Arm PLL 00001 <b>SYS_PLL</b> — System PLL 00010 <b>PF4</b> — ref_pfd4_clk == pfd0_clk

*Table continues on the next page...*

**CCM\_ANALOG\_MISC1n field descriptions (continued)**

Field	Description
00011	<b>PFD5</b> — ref_pfd5_clk == pll2_pfd1_clk
00100	<b>PFD6</b> — ref_pfd6_clk == pll2_pfd2_clk
00101	<b>PFD7</b> — ref_pfd7_clk == pll2_pfd3_clk
00110	<b>AUDIO_PLL</b> — Audio PLL
00111	<b>VIDEO_PLL</b> — Video PLL
01001	<b>ETHERNET_REF</b> — ethernet ref clock (ENET_PLL)
01100	<b>USB1_PLL</b> — USB1 PLL clock
01101	<b>USB2_PLL</b> — USB2 PLL clock
01110	<b>PFD0</b> — ref_pfd0_clk == pll3_pfd0_clk
01111	<b>PFD1</b> — ref_pfd1_clk == pll3_pfd1_clk
10000	<b>PFD2</b> — ref_pfd2_clk == pll3_pfd2_clk
10001	<b>PFD3</b> — ref_pfd3_clk == pll3_pfd3_clk
10010	<b>XTAL</b> — xtal (24M)
10101 to 11111	ref_pfd7_clk == pll2_pfd3_clk

### 18.7.19 Miscellaneous Register 2 (CCM\_ANALOG\_MISC2n)

This register defines the control for miscellaneous analog blocks.

#### NOTE

This register is shared with PMU.

Address: 20C\_8000h base + 170h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
15 AUDIO_DIV_LSB	<p>LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.</p> <p><b>NOTE:</b> LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value for more information.</p> <ul style="list-style-type: none"> <li>00 divide by 1 (Default)</li> <li>01 divide by 2</li> <li>10 divide by 1</li> <li>11 divide by 4</li> </ul>
14 REG1_OK	<p>GPU/VPU supply</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
13 REG1_ENABLE_BO	<p>Enables the brownout detection.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
12 -	This field is reserved.
11 REG1_BO_STATUS	<p>Reg1 brownout status bit.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <ul style="list-style-type: none"> <li>1 Brownout, supply is below target minus brownout offset.</li> </ul>
10–8 REG1_BO_OFFSET	<p>This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <ul style="list-style-type: none"> <li>100 Brownout offset = 0.100V</li> <li>111 Brownout offset = 0.175V</li> </ul>
7 PLL3_disable	<p>When USB is in low power suspend mode this Control bit is used to indicate if other system peripherals require the USB PLL3 clock when the SoC is not in low power mode. A user needs to set this bit if they want to optionally disable PLL3 while the SoC is not in any low power mode to save power. When the system does go into low power mode this bit setting would not have any affect.</p> <p><b>NOTE:</b> When USB is in low power suspend mode users would need to ensure PLL3 is not being used before setting this bit in RUN mode. Please refer to the correct PLL disabling procedure in <a href="#">Disabling / Enabling PLLs</a></p> <ul style="list-style-type: none"> <li>0 PLL3 is being used by peripherals and is enabled when SoC is not in any low power mode</li> <li>1 PLL3 can be disabled when the SoC is not in any low power mode</li> </ul>
6 REG0_OK	<p>ARM supply</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>

*Table continues on the next page...*

**CCM\_ANALOG\_MISC2n field descriptions (continued)**

Field	Description
5 REG0_ENABLE_BO	Enables the brownout detection.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
4 -	This field is reserved.
3 REG0_BO_STATUS	Reg0 brownout status bit.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>  1 Brownout, supply is below target minus brownout offset.
REG0_BO_OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

# Chapter 19

## CMOS Sensor Interface (CSI)

### 19.1 Overview

This chapter presents the CMOS Sensor Interface (CSI) architecture, operation principles, and programming model.

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, **dumb** and **smart**. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit / 16-bit / 24-bit data port for YCbCr, YUV, or RGB data input.
- 8-bit / 10-bit / 16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit / pixel data format to receive FIFO packing.
- 256 x 64 FIFO to store received image pixel data.
- Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.  
是否是能直接以形状的方式传送
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.

- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).
- Supports simple deinterlacing of interlaced input.

支持简单的隔行输入的反隔行

## 19.2 External Signals

The table below describes the external signals for the CSI. The external signals are tied between the CSI module and an external CMOS sensor.

**Table 19-1. CSI External Signals**

Signal	Description	Pad	Mode	Direction
DATA0	Data Sensor Signal 0, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA17	ALT3	I
		UART3_RX_DATA	ALT3	I
DATA1	Data Sensor Signal 1, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA16	ALT3	I
		UART3_TX_DATA	ALT3	I
DATA2	Data Sensor Signal 2, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA00	ALT0	I
		UART1_TX_DATA	ALT3	I
DATA3	Data Sensor Signal 3 part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA01	ALT0	I
		UART1_RX_DATA	ALT3	I
DATA4	Data Sensor Signal 4, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA02	ALT0	I
		UART1_CTS_B	ALT3	I
DATA5	Data Sensor Signal 5, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA03	ALT0	I
		UART1_RTS_B	ALT3	I
DATA6	Data Sensor Signal 6, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA04	ALT0	I
		UART2_TX_DATA	ALT3	I
DATA7	Data Sensor Signal 7 part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA05	ALT0	I
		UART2_RX_DATA	ALT3	I
DATA8	Data Sensor Signal 8, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA06	ALT0	I
		UART2_CTS_B	ALT3	I
DATA9	Data Sensor Signal 9 part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA07	ALT0	I
		UART2_RTS_B	ALT3	I
DATA10	Data Sensor Signal 10, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA18	ALT3	I
		UART3_CTS_B	ALT3	I
DATA11	Data Sensor Signal 11, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA19	ALT3	I
		UART3_RTS_B	ALT3	I

Table continues on the next page...

## 19.3 Clocks

The following table describes the clock sources for CSI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 19-2. CSI Clocks**

Clock name	Clock Root	Description
csi_hclk	ahb_clk_root	Module clock
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_s_raw	ipg_clk_root	Peripheral raw data clock

## 19.4 Principles of Operation

The information found here describes the modes of operation of the sensor interface.

The CSI is designed to support generic sensor interface timing as well as CCIR656 video interface timing. Traditional CMOS sensors typically use VSYNC (SOF), HSYNC (BLANK), and PIXCLK signals to output Bayer or YUV data. Smart CMOS sensors, that come with on-chip imaging processing, usually support video mode transfer. They use an embedded timing codec to replace the VSYNC and HSYNC signal. The timing codec is defined by the CCIR656 standard.

The CSI can support connection with the sensor as follows.

- To connect with one 8-bit sensor, the sensor data interface should connect to CSI\_DATA[9:2].
- To connect with one 10-bit sensor, the sensor data interface should connect to CSI\_DATA[9:0].
- To connect with one 16-bit sensor, the sensor data interface should connect to CSI\_DATA[15:0].

- To connect with one 24-bit sensor, connect either the video pass-through, TV Decoder input, or the sensor data interface to CSI\_DATA[23:0].
- To connect with two 8-bit sensors, the sensor data interfaces should connect to CSI\_DATA[7:0] and CSI\_DATA[15:8].

## 19.4.1 Data Transfer with the Embedded DMA Controllers

The CSI has two embedded DMA controllers, one for the receive FIFO and the other for the statistic FIFO. It supports 2D DMA transfer from the receive FIFO to the frame buffers in the external memory and linear DMA transfer from the statistic FIFO.

To transfer data from the RxFIFO to the external memory, the user should set the start address in the frame buffer where the transferred data is stored, the parameters of the frame buffers, and the parameters of the image coming from the sensor. The user can have two frame buffers in the external memory. Each one will store a frame of image coming from the sensor. The embedded DMA controller will first write the frame buffer1 and then frame buffer2. These two frame buffers will be written by turns. The start address should be aligned in and set in the CSIDMASA-FB1 and CSIDMASA-FB2 registers. In the CSIFBUF\_PARA register, the user should set the stride of the frame buffer to show how many to skip before starting to write the next row of the image. In the CSIIIMAG\_PARA register, the user should set the width and height of the image coming from the sensor. The RxFF\_LEVEL and DMA\_REQ\_EN\_RFF bits in CSICR3 registers also need to be set before the data transfer starts. When the number of the data in the RxFIFO reaches the trigger level, a DMA request will be sent to the embedded DMA controller and the data will be read out from the RxFIFO and written through AHB bus into the external frame buffers. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA\_BURST\_TYPE\_RFF bits in CSICR2 register. After all data in an image frame are transferred, the DMA\_TSF\_DONE\_FB1 or DMA\_TSF\_DONE\_FB2 bit will be set in CSISR register and the interrupt can be triggered if the corresponding enable bit is set in CSICR1 register. The DMA\_REFLASH\_RFF bit in CSICR3 can be used to activate or restart the embedded DMA controller.

The RxFIFO has the overrun protection mechanism in case the RxFIFO is overrun during data transfer. If the RxFIFO is full and more data needs to be received during the data transfer, the RxFIFO will be overwritten continuously and all 128 words of data in the RxFIFO before overrun occurred will be discarded; the corresponding 128 words memory space in the frame buffer will keep the previous values.

To transfer data from the statistic FIFO to the external memory, the user should set the start address of the external memory where the transferred data is stored and the total transfer sizes. The start address and the transfer sizes are all aligned in and should be set in the CSIDMASA-STATFIFO and CSIDMATS-STATFIFO registers. The STATFF LEVEL and DMA\_REQ\_EN\_SFF bits in CSICR3 registers should also be set before the data transfer starts. When the number of the data in the STATFIFO reaches the trigger level, a dma request will be sent to the embedded DMA controller and the data will be read out from the STATFIFO and written through AHB bus into the external memory. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA\_BURST\_TYPE\_SFF bits in CSICR2 register. After all expected data (defined by the total transfer sizes) are transferred, the DMA\_TSF\_DONE\_SFF bit will be set in CSISR register and an interrupt can be triggered if the SFF\_DMA\_DONE\_INTEN is enabled in CSICR1 register. The DMA\_REFFLASH\_SFF bit in CSICR3 can be used to activate or re-start the embedded DMA controller.

## 19.4.2 Gated Clock Mode

VSYNC, HSYNC, and PIXCLK signals are used in gated clock mode.

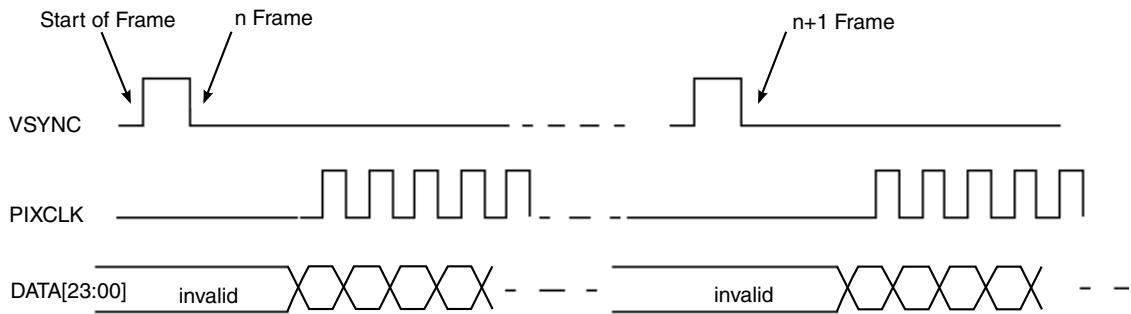

启动-停止

停止?

A frame starts with an active edge on VSYNC, then HSYNC asserts and holds for the entire line. The Pixel clock is valid as long as HSYNC is asserted. Data is latched at the active edge of the valid pixel clocks. HSYNC deasserts at the end of line. Pixel clocks then become invalid and CSI stops receiving data from the stream. For the next line the HSYNC timing repeats. For the next frame the VSYNC timing repeats.

## 19.4.3 Non-Gated Clock Mode

In non-gated clock mode, only the VSYNC and PIXCLK signals are used; the HSYNC signal is ignored.

**Figure 19-1. Non-Gated Clock Mode Timing Diagram**

The overall timing of non-gated mode is the same as the gated-clock mode, except for the HSYNC signal. HSYNC signal is ignored by the CSI. All incoming pixel clocks are valid and cause data to be latched into RxFIFO. The PIXCLK signal is inactive (states low) until valid data is ready to be transmitted over the bus.  
←

Figure 19-1 shows the timing of a typical sensor. Other sensors may have the slightly different timing from that shown. The CSI can be programmed to support rising/falling-edge triggered VSYNC, active-high/low HSYNC, and rising/falling-edge triggered PIXCLK.

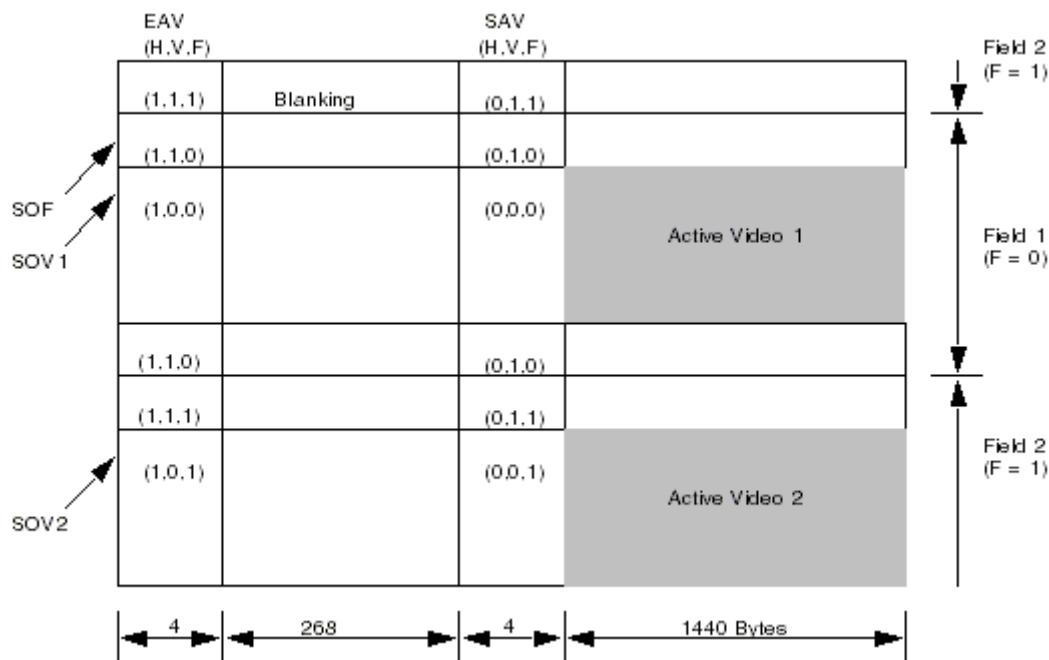

#### 19.4.4 CCIR656 Interlace Mode

In CCIR656 interlace mode, only the PIXCLK and CSI\_DATA[9:2] signals are used. The start of frame and blank signals are replaced by a timing codec which is embedded in the data stream. Each active line starts with an Start of Active Video (SAV) code and ends with an End of Active Video (EAV) code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, recovering VSYNC and HSYNC signals for internal use, such as statistical block control. Data is forwarded to the data receive and packing block in a sequential manner without reordering—that is, field 1 followed by field 2. The fields must be reordered in software to get back the original image.

Change of Field (COF) interrupt is triggered upon every field change. The interrupt service routine reads the status register to check for the current field.

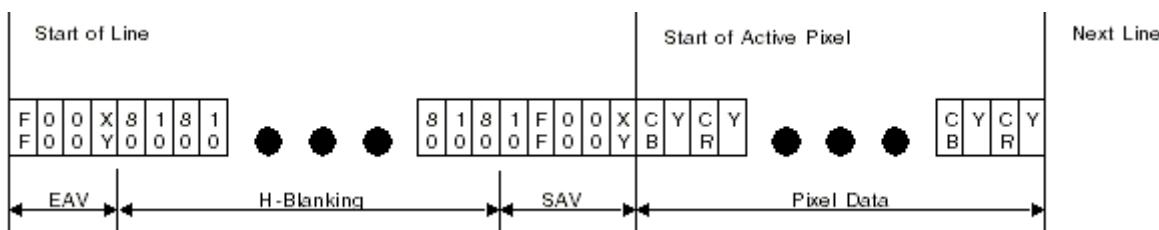

According to the CCIR656 specification, the image must be in 625/50 PAL or 525/60 NTSC format. In addition, the image is interlaced into odd and even fields with vertical and horizontal blank data being filled into certain lines. Data must be in YCbCr422 format, each pixel contains 2 bytes, either Y + Cr or Y + Cb. These requirements are set for TV systems. The CSI module supports PAL and NTSC format only.

The following figure describes the frame structure in PAL system, showing vertical and horizontal blanking.

**Figure 19-2. CCIR656 Interlace Mode (PAL)**

The following figure describes the general timing for a single line, showing SAV and EAV.

**Figure 19-3. CCIR656 General Line Timing**

The coding tables recommended by the CCIR656 specification are shown below. It is used in the CCIR656 mode to decode the video stream. An interrupt is generated for SOF, which is decoded from the embedded timing codec.

**Table 19-4. Coding for SAV and EAV**

Data Bit Number	1st Byte 0xFF	2nd Byte 0x00	3rd Byte 0x00	4th Byte 0xXY
7 (MSB)	1	0	0	1
6	1	0	0	F
5	1	0	0	V
4	1	0	0	H
3	1	0	0	P3
2	1	0	0	P2
1	1	0	0	P1
0	1	0	0	P0

**Table 19-5. Codes with Protection bits for Error Detection/Correction**

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

**Table 19-6. Representations by F-Bit**

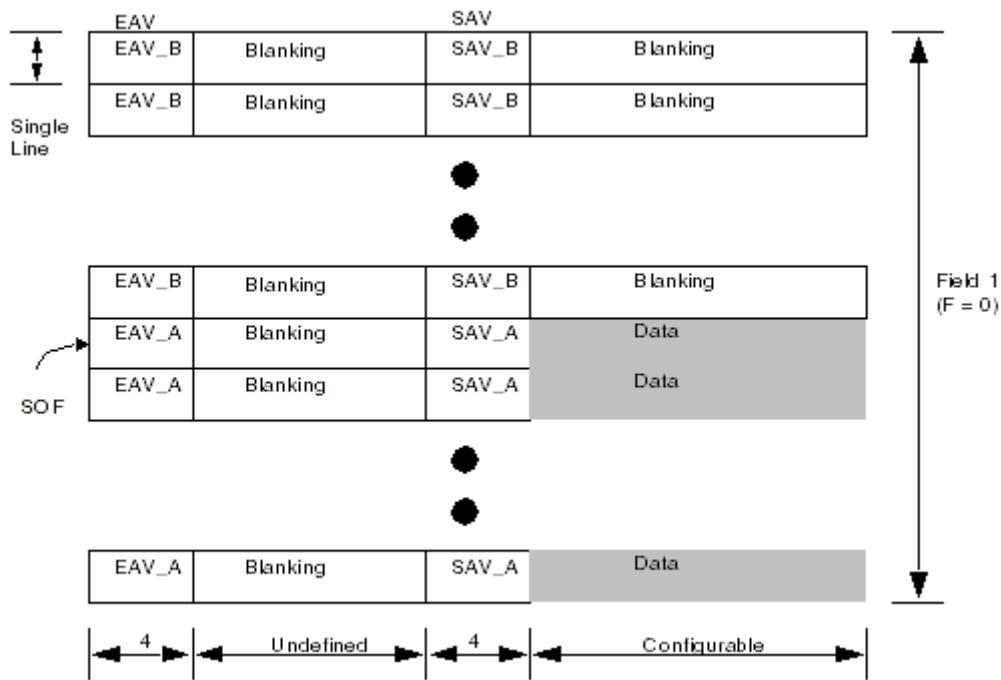

F-Bit	Representations
0	ODD FIELD (FIELD 1)
1	EVEN FIELD (FIELD 2)

## 19.4.5 CCIR656 Progressive Mode

For a CMOS camera system of VGA or CIF resolution, strict adherence to the interlace requirements stated in the CIR standard is not required.

The image is considered to have only 1 active field which is scanned in a progressive manner. This active field is regarded as field 1 and the F-bit in the timing codec is ignored by the decoder. Most sensors support CCIR timing in this mode (progressive) by default.

The following figure shows the typical flow of progressive mode.

**Figure 19-4. CCIR656 Progressive Mode (General Case)**

An interrupt is generated for SOF but not for COF. In the general case, when SOF information is retrieved from the embedded coding, it is known as internal VSYNC mode. In other cases, when the VSYNC signal is provided by the sensor, it is known as external VSYNC mode. The CSI can be operated in internal or external VSYNC mode.

## 19.4.6 Error Correction for CCIR656 Coding

According to the algorithm for CCIR coding, protection bits in the SAV and EAV are encoded in the way that allows a 1-bit error to be corrected, or a 2-bit error to be detected by the decoder. This feature is supported by the interlace mode CCIR decoder in CSI.

For the 1-bit error case, users can select the error to be corrected automatically, or simply shown as a status flag instead. For the 2-bit error case, because the decoder is unable to make a correction, the error would be shown as a status flag only.

An interrupt can be generated upon the detection of an error. This signal can be enabled or disabled without affecting the operation of the status bit.

## 19.4.7 Deinterlacer

Deinterlacing is the process of converting interlaced video, such as CCIR656 input, into a non-interlaced form.

The CSI uses the weaving method to do deinterlacing. Weaving is done by adding consecutive fields together. CSI uses top-field detection function. No matter input is NTSC or PAL mode, the combined frame will always put the top-field first and then bottom-field.

## 19.5 Interrupt Generation

The information found here describes CSI events that generate interrupts.

### 19.5.1 Start Of Frame Interrupt (SOF\_INT)

The source of an SOF interrupt is dependent on the mode of operation.

In traditional mode, VSYNC signal is taken from sensor and SOF\_INT is generated at the rising or falling edge (programmable) of VSYNC.

In CCIR interlace mode, the SOF interrupt information is retrieved from the embedded coding and SOF\_INT is generated.

In CCIR progressive mode, there are two sources of an SOF interrupt:

- In *internal* VSYNC mode, SOF is retrieved from the embedded coding.
- In *external* VSYNC mode, VSYNC is taken from the sensor and SOF is generated at the rising edge of VSYNC.

### 19.5.2 End Of Frame Interrupt (EOF\_INT)

An EOF interrupt is generated when the frame ends and the complete frame data in RXFIFO is read.

The EOF event triggering works with the RX count register (CSIRXCNT). Software sets the RX count register to the frame size (in words). The CSI RX logic then counts the number of pixel data being received and compares it with the RX count. If the preset value is reached, an EOF interrupt is generated and the data in the RXFIFO are read. If a SOF event is detected before this happens, the EOF interrupt is not generated.

### 19.5.3 Change Of Field Interrupt (COF\_INT)

The Change of Field interrupt is only valid in CCIR Interlace mode. The COF interrupt is generated when the field toggles, either from field 1 to field 2, or field 2 to field 1.

Software should first check COF\_INT bit in the CSI Status Register (CSISTAT) before checking that F1\_INT or F2\_INT is turned on.

In PAL systems, the field changes at the beginning of the frame and coincides with SOF. For the first field, a COF interrupt is not generated, only an SOF. The COF interrupt is generated for the second field.

### 19.5.4 CCIR Error Interrupt (ECC\_INT)

The CCIR Error Interrupt is only valid for CCIR Interlace mode. An ECC interrupt is generated when an error is found on the SAV or EAV codes in the incoming stream. When this happens, the ECC\_INT status bit is set.

### 19.5.5 RxFIFO Full Interrupt (RxFF\_INT)

A RxFIFO full interrupt is generated when the number of data in RXFIFO reaches the water mark defined by RxFF\_LEVEL in CSICR3.

### 19.5.6 Statistic FIFO Full Interrupt (STATFF\_INT)

A StatFIFO full interrupt is generated when the number of data in STATFIFO reaches the water mark defined by STATFF\_LEVEL in CSICR3.

### 19.5.7 RxFIFO Overrun Interrupt (RFF\_OR\_INT)

A RxFIFO Overrun interrupt is generated when the RxFIFO has 128 words data and more data is being written in.

### 19.5.8 Statistic FIFO Overrun Interrupt (SFF\_OR\_INT)

A StatFIFO Overrun interrupt is generated when the STATFIFO has 64 words data and more data is being written in.

### 19.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_FB1)

A DMA transfer done interrupt of frame buffer1 is generated when one frame of data are transferred from RxFIFO to the frame buffer1 in the external memory.

### 19.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_FB2)

A DMA transfer done interrupt of frame buffer2 is generated when one frame of data are transferred from RxFIFO to the frame buffer2 in the external memory.

### 19.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_SFF)

A StatFIFO DMA transfer done interrupt is generated when all the data are transferred from StatFIFO to the external memory. The transfer size is defined in the STATFIFO DMA Transfer Size Register.

### 19.5.12 AHB Bus Response Error Interrupt (HRESP\_ERR\_INT)

An AHB Bus response error interrupt is generated when a bus error is detected.

### 19.5.13 DMA Field 0 Transfer Done Interrupt (DMA\_FIELD0\_DONE)

A DMA transfer done interrupt of field 0 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

### 19.5.14 DMA Field 1 Transfer Done Interrupt (DMA\_FIELD1\_DONE)

A DMA transfer done interrupt of field 1 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

### 19.5.15 Base Address Change Error Interrupt (BASEADDR\_CHANGE\_ERROR)

A Base Address change error is generated when the base address changed while the last frame data transfer are not finished.

## 19.6 Data Packing Style

Careful attention to endianess is needed given the different port sizes at different stages of the image capture path.

To enable flexible packing of image data before storage in the FIFOs, the CSI module can swap data fields by use of the PACK\_DIR and the SWAP16\_EN bit in CSI Control Register 1 (CSICR1).

The CSI module accepts 8-bit, 10-bit or 16-bit data from the sensor by configuring PIXEL\_BIT bit in CSI Control Register 1 (CSICR1) and TWO\_8BIT\_SENSOR bit in CSI Control Register3 (CSICR3). The input data is packed according to the setting of PACK\_DIR bit. The packed data is stored in the RX FIFO according to the setting of the SWAP16\_EN bit.

For 10-bit per pixel data format, each pixel is expanded to 16 bits by appending 6 zeros bits to the most significant bit. For 16-bit data format, the data path can be a combination by two 8-bit sensors. One sensor is connected to the CSI\_DATA[7:0]. The other sensor is connected to CSI\_DATA[15:8].

## 19.6.1 RX FIFO Path

### 19.6.1.1 Bayer Data

Bayer data is a type of raw data from the image sensor. This byte-wide data must be converted to the RGB space or YUV space by software. The data path for Bayer data is from the CSI to memory. If the system is in little endian, then the PACK\_DIR bit should be set to 0. 8-bit data format from a sensor is packed to bits as , where P0 is the pixel coming in time slot 0 (first data) and P3 is the pixel coming in time slot 3 (the last data in the word). When the data is addressed as bytes by software, P0 is transferred first, P1 is transferred next, and so on. 10-bit data format is packed to bits as , where P0 is the 10-bit data coming in time slot 0 (first pixel) and is the 10-bit data coming in time ( pixel). 16-bit data, from two sensors, is packed to bits as , where P0 and P1 are the two 8-bit data coming in time slot 0 (P0 is the first pixel of the sensor connected with CSI\_DATA[7:0] and P1 is the first pixel of the sensor connected with CSI\_DATA[15:8]). P2 and P3 are the two 8-bit data coming in time slot 1 (second pixels of the two sensors).

### 19.6.1.2 RGB565 Data

RGB565 data is processed data from the image sensor, which can be put directly into the display buffer. The data is 16 bits wide. The data path is from CSI to memory to the display controller. On the sensor side, data must be transmitted as P0 first, followed by P1, and so on. For each pixel, whether the MSB or LSB is sent first depends on the endianness of the sensor. Data is 16 bits wide with the MSB labeled RG, and the LSB labeled GB. P0 is represented as RG0 and GB0.

CSI receives data in one of the following sequence:

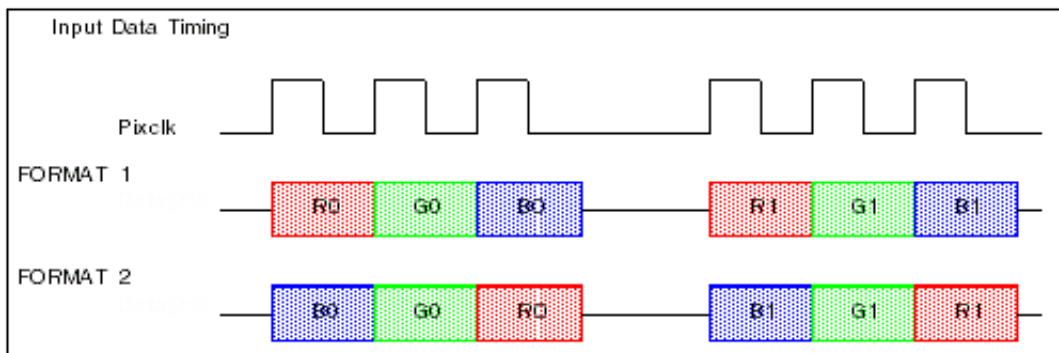

- RG0, GB0, RG1, GB1, while RG0 comes out at time slot 0 (first data), and GB1 comes out at time slot 3 (last data)
- GB0, RG0, GB1, RG1

Using the first sequence as an example, and assuming the system is running in little endian, the data is presented as:

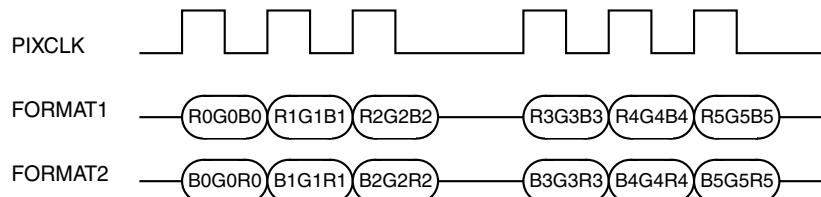

- 8-bit data from sensor: RG0, GB0, RG1, GB1, ...
- data before storage in the CSI RX FIFO (PACK\_DIR bit = 1):
- data in CSI RX FIFO (SWAP16\_EN bit enabled):
- transfer to system memory:
- 16-bit read by display controller: RG0GB0, RG1GB1

### 19.6.1.3 RGB888 Data

This is another kind of processed data from image sensor, which can be used for further image processing directly. Each of the data consist of 8-bit Red, 8-bit Green, and 8-bit Blue data. An example of timing scheme is shown in the following figure.

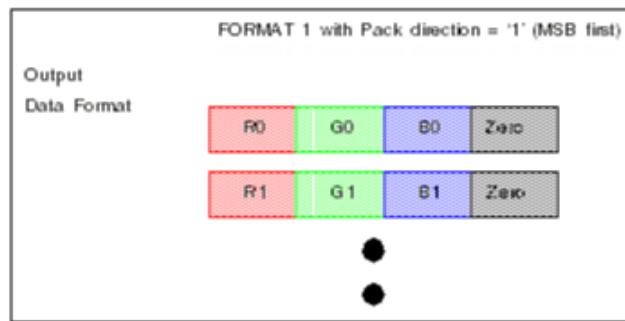

**Figure 19-5. Sample Timing Diagram for RGB888 8 bits/cycle Data**

**Figure 19-6. Sample Timing Diagram for RGB888 24 bits/cycle Data**

An optional scheme to pack a dummy byte is provided. For every group of 3 bytes data, a dummy zero is packed to form a 32-bit word as shown in the following figure. The dummy zero can be packed at the LSB position or MSB position. Using `RGB888A_FORMAT_SEL` in `CSI_CSICR18[18]` to determine to put the dummy bytes packed at LSB or MSB position.

## RX FIFO Path

## 19.6.2 STAT FIFO Path

Statistics only works for Bayer data in 8-bit per pixel format. It generates 16-bit statistical output from the 8-bit Bayer input (CSI\_DATA[13:6]). The outputs are Sum of Green (G), Sum of Red (R), Sum of Blue (B), and Auto Focus (F). Each output is 16-bits wide.

The settings of PACK\_DIR and SWAP16\_EN bits in the CSICR1 register have no effect on the input path. The PACK\_DIR only controls how the 16-bit stat output is packed into the 32-bit STAT FIFO.

When the PACK\_DIR bit = 1, the stat data is packed as:

First 32-bit: RG

Second 32-bit: BF

...

When the PACK\_DIR bit = 0, the stat data is packed as:

First 32-bit GR

Second 32-bit: FB

...

## 19.7 CSI Memory Map/Register Definition

All the 32-bit registers of the CSI module are summarized in the Memory Map below:

**CSI memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21C_4000	CSI Control Register 1 (CSI_CSICR1)	32	R/W	4000_0800h	<a href="#">19.7.1/771</a>
21C_4004	CSI Control Register 2 (CSI_CSICR2)	32	R/W	0000_0000h	<a href="#">19.7.2/775</a>
21C_4008	CSI Control Register 3 (CSI_CSICR3)	32	R/W	0000_0000h	<a href="#">19.7.3/777</a>

### 19.7.1 CSI Control Register 1 (CSI\_CSICR1)

This register controls the sensor interface timing and interrupt generation. The interrupt enable bits in this register control the interrupt signals and the status bits. That means status bits will only function when the corresponding interrupt bits are enabled.

#### CSI\_CSICR1 field descriptions

Field	Description
31 SWAP16_EN	<p>SWAP 16-Bit Enable. This bit enables the swapping of 16-bit data. Data is packed from 8-bit or 10-bit to 32-bit first (according to the setting of PACK_DIR) and then swapped as 16-bit words before being put into the RX FIFO. The action of the bit only affects the RX FIFO and has no affect on the STAT FIFO.</p> <p><b>NOTE:</b> Example of swapping enabled:            Data input to FIFO = 0x11223344            Data in RX FIFO = 0x 33441122</p> <p><b>NOTE:</b> Example of swapping disabled:            Data input to FIFO = 0x11223344            Data in RX FIFO = 0x11223344</p>

Table continues on the next page...

**CSI\_CSICR1 field descriptions (continued)**

Field	Description
	0 Disable swapping 1 Enable swapping
30 EXT_VSYNC	External VSYNC Enable. This bit controls the operational VSYNC mode. <b>NOTE:</b> This only works when the CSI is in CCIR progressive mode. 0 Internal VSYNC mode 1 External VSYNC mode
29 EOF_INT_EN	End-of-Frame Interrupt Enable. This bit enables and disables the EOF interrupt. 0 EOF interrupt is disabled. 1 EOF interrupt is generated when RX count value is reached.
28 PrP_IF_EN	CSI-PrP Interface Enable. This bit controls the CSI to PrP bus. When enabled the RxFIFO is detached from the AHB bus and connected to PrP. All CPU reads or DMA accesses to the RxFIFO register are ignored. All CSI interrupts are also masked. 0 CSI to PrP bus is disabled 1 CSI to PrP bus is enabled
27 VIDEO_MODE	Video mode select. This bit controls the video mode in CCIR mode. 0 Progressive mode is selected 1 Interlace mode is selected
26 COF_INT_EN	Change Of Image Field (COF) Interrupt Enable. This bit enables the COF interrupt. This bit works only in CCIR interlace mode which is when CCIR_EN = 1 and CCIR_MODE = 1. 0 COF interrupt is disabled 1 COF interrupt is enabled
25 SF_OR_INTEN	STAT FIFO Overrun Interrupt Enable. This bit enables the STATFIFO overrun interrupt. 0 STATFIFO overrun interrupt is disabled 1 STATFIFO overrun interrupt is enabled
24 RF_OR_INTEN	RxFIFO Overrun Interrupt Enable. This bit enables the RX FIFO overrun interrupt. 0 RxFIFO overrun interrupt is disabled 1 RxFIFO overrun interrupt is enabled
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 SFF_DMA_DONE_INTEN	STATFIFO DMA Transfer Done Interrupt Enable. This bit enables the interrupt of STATFIFO DMA transfer done. 0 STATFIFO DMA Transfer Done interrupt disable 1 STATFIFO DMA Transfer Done interrupt enable
21 STATFF_INTEN	STATFIFO Full Interrupt Enable. This bit enables the STAT FIFO interrupt. 0 STATFIFO full interrupt disable 1 STATFIFO full interrupt enable
20 FB2_DMA_DONE_INTEN	Frame Buffer2 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer2 DMA transfer done.

Table continues on the next page...

**CSI\_CSICR1 field descriptions (continued)**

Field	Description
	0 Frame Buffer2 DMA Transfer Done interrupt disable 1 Frame Buffer2 DMA Transfer Done interrupt enable
19 FB1_DMA_DONE_INTEN	Frame Buffer1 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer1 DMA transfer done. 0 Frame Buffer1 DMA Transfer Done interrupt disable 1 Frame Buffer1 DMA Transfer Done interrupt enable
18 RXFF_INTEN	RxFIFO Full Interrupt Enable. This bit enables the RxFIFO full interrupt. 0 RxFIFO full interrupt disable 1 RxFIFO full interrupt enable
17 SOF_POL	SOF Interrupt Polarity. This bit controls the condition that generates an SOF interrupt. 0 SOF interrupt is generated on SOF falling edge 1 SOF interrupt is generated on SOF rising edge
16 SOF_INTEN	Start Of Frame (SOF) Interrupt Enable. This bit enables the SOF interrupt. 0 SOF interrupt disable 1 SOF interrupt enable
15–12 Reserved	This field is reserved. Reserved. This field is reserved.
11 HSYNC_POL	HSYNC Polarity Select. This bit controls the polarity of HSYNC. This bit only works in gated-clock—that is, GCLK_MODE = 1 and CCIR_EN = 0. 0 HSYNC is active low 1 HSYNC is active high
10 CCIR_EN	CCIR656 Interface Enable. This bit selects the type of interface used. When the CCIR656 timing decoder is enabled, it replaces the function of timing interface logic. 0 Traditional interface is selected. Timing interface logic is used to latch data. 1 CCIR656 interface is selected.
9 Reserved	This field is reserved. This field is reserved.
8 FCC	FIFO Clear Control. This bit determines how the RXFIFO and STATFIFO are cleared. When Synchronous FIFO clear is selected the RXFIFO and STATFIFO are cleared, and STAT block is reset, on every SOF. FIFOs and STAT block restarts immediately after reset. For information on the operation when Asynchronous FIFO clear is selected, refer to the descriptions for the CLR_RXFIFO and CLR_STATFIFO bits. 0 Asynchronous FIFO clear is selected. 1 Synchronous FIFO clear is selected.
7 PACK_DIR	Data Packing Direction. This bit Controls how 8-bit/10-bit image data is packed into 32-bit RX FIFO, and how 16-bit statistical data is packed into 32-bit STAT FIFO. 0 Pack from LSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x44332211 in RX FIFO. For stat data, 0xAAAA, 0xB BBBB, it will appear as 0xBBBBAAAA in STAT FIFO. 1 Pack from MSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x11223344 in RX FIFO. For stat data, 0xAAAA, 0xB BBBB, it will appear as 0xAAAABBBB in STAT FIFO.

*Table continues on the next page...*

**CSI\_CSICR1 field descriptions (continued)**

Field	Description
6 CLR_STATFIFO	Asynchronous STATFIFO Clear. This bit clears the STATFIFO and Reset STAT block. This bit works only in async FIFO clear mode—that is, FCC = 0. Otherwise this bit is ignored. Writing 1 will clear STATFIFO and reset STAT block immediately, STATFIFO and STAT block then wait and restart after the arrival of next SOF. The bit is restored to 0 automatically after finish. Normally reads 0.
5 CLR_RXFIFO	Asynchronous RXFIFO Clear. This bit clears the RXFIFO. This bit works only in async FIFO clear mode—that is, FCC = 0. Otherwise this bit is ignored. Writing 1 clears the RXFIFO immediately, RXFIFO restarts immediately after that. The bit is restored to 0 automatically after finish. Normally reads 0.
4 GCLK_MODE	Gated Clock Mode Enable. Controls if CSI is working in gated or non-gated mode. This bit works only in traditional mode—that is, CCIR_EN = 0. Otherwise this bit is ignored. 0 Non-gated clock mode. All incoming pixel clocks are valid. HSYNC is ignored. 1 Gated clock mode. Pixel clock signal is valid only when HSYNC is active.
3 INV_DATA	Invert Data Input. This bit enables or disables internal inverters on the data lines. 0 CSI_D[7:0] data lines are directly applied to internal circuitry 1 CSI_D[7:0] data lines are inverted before applied to internal circuitry
2 INV_PCLK	Invert Pixel Clock Input. This bit determines if the Pixel Clock (CSI_PIXCLK) is inverted before it is applied to the CSI module. 0 CSI_PIXCLK is directly applied to internal circuitry 1 CSI_PIXCLK is inverted before applied to internal circuitry
1 REDGE	Valid Pixel Clock Edge Select. Selects which edge of the CSI_PIXCLK is used to latch the pixel data. 0 Pixel data is latched at the falling edge of CSI_PIXCLK 1 Pixel data is latched at the rising edge of CSI_PIXCLK
0 PIXEL_BIT	Pixel Bit. This bit indicates the bayer data width for each pixel. This bit should be configured before activating or re-starting the embedded DMA controller. 0 8-bit data for each pixel 1 10-bit data for each pixel

## 19.7.2 CSI Control Register 2 (CSI\_CSICR2)

This register provides the statistic block with data about which live view resolution is being used, and the starting sensor pixel of the Bayer pattern. It also contains the horizontal and vertical count used to determine the number of pixels to skip between the 64 x 64 blocks of statistics when generating statistics on live view image that are greater than 512 x 384.

Address: 21C\_4000h base + 4h offset = 21C\_4004h

Field	Description
27 -	This field is reserved. Reserved. These bit is reserved and should read 0.
26 DRM	Double Resolution Mode. Controls size of statistics grid. 0 Stats grid of 8 x 6 1 Stats grid of 8 x 12
25–24 AFS	Auto Focus Spread. Selects which green pixels are used for auto-focus. 00 Abs Diff on consecutive green pixels 01 Abs Diff on every third green pixels 1x Abs Diff on every four green pixels
23 SCE	Skip Count Enable. Enables or disables the skip count feature. 0 Skip count disable 1 Skip count enable
22–21 -	This field is reserved. Reserved. These bits are reserved and should read 0.
20–19 BTS	Bayer Tile Start. Controls the Bayer pattern starting point. 00 GR 01 RG 10 BG 11 GB
18–16 LVRM	Live View Resolution Mode. Selects the grid size used for live view resolution. 0 512 x 384 1 448 x 336 2 384 x 288 3 384 x 256 4 320 x 240 5 288 x 216 6 400 x 300
15–8 VSC	Vertical Skip Count. Contains the number of rows to skip. SCE must be 1, otherwise VSC is ignored. 0-255 Number of rows to skip minus 1
HSC	Horizontal Skip Count. Contains the number of pixels to skip. SCE must be 1, otherwise HSC is ignored. 0-255 Number of pixels to skip minus 1

### 19.7.3 CSI Control Register 3 (CSI\_CSICR3)

This read/write register acts as an extension of the functionality of the CSI Control register 1, adding additional control and features.

Address: 21C\_4000h base + 8h offset = 21C\_4008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

#### CSI\_CSICR3 field descriptions

Field	Description
31–16 FRMCNT	Frame Counter. This is a 16-bit Frame Counter (Wraps around automatically after reaching the maximum)
15 FRMCNT_RST	Frame Count Reset. Resets the Frame Counter. (Cleared automatically after reset is done)  0 Do not reset 1 Reset frame counter immediately
14 DMA_REFFLASH_RFF	Reflash DMA Controller for RxFIFO. This bit refash the embedded DMA controller for RxFIFO. It should be reflashed before the embedded DMA controller starts to work. (Cleared automatically after reflashing is done)  0 No reflashing 1 Reflash the embedded DMA controller
13 DMA_REFFLASH_SFF	Reflash DMA Controller for STATFIFO. This bit refash the embedded DMA controller for STATFIFO. It should be reflashed before the embedded DMA controller starts to work. (Cleared automatically after reflashing is done)  0 No reflashing 1 Reflash the embedded DMA controller

Table continues on the next page...

## CSI\_CSICR3 field descriptions (continued)

Field	Description
12 DMA_REQ_EN_ RFF	DMA Request Enable for RxFIFO. This bit enables the dma request from RxFIFO to the embedded DMA controller.  0 Disable the dma request 1 Enable the dma request
11 DMA_REQ_EN_ SFF	DMA Request Enable for STATFIFO. This bit enables the dma request from STATFIFO to the embedded DMA controller.  0 Disable the dma request 1 Enable the dma request
10–8 STATFF_LEVEL	STATFIFO Full Level. When the number of data in STATFIFO reach this level, STATFIFO full interrupt is generated, or STATFIFO DMA request is sent.  000 4 001 8 010 12 011 16 100 24 101 32 110 48 111 64
7 HRESP_ERR_ EN	Hresponse Error Enable. This bit enables the hresponse error interrupt.  0 Disable hresponse error interrupt 1 Enable hresponse error interrupt
6–4 RxFF_LEVEL	<b>RxFIFO Full Level.</b> When the number of data in Rx FIFO reaches this level, a Rx FIFO full interrupt is generated, or an RX FIFO DMA request is sent.  000 4 001 8 010 16 011 24 100 32 101 48 110 64 111 96
3 TWO_8BIT_ SENSOR	Two 8-bit Sensor Mode. This bit indicates one 16-bit sensor or two 8-bit sensors are connected to the 16-bit data ports. This bit should be set if there is one 16-bit sensor or two 8-bit sensors are connected. This bit should be configured before activating or restarting the embedded DMA controller.  0 Only one sensor is connected. 1 Two 8-bit sensors are connected or one 16-bit sensor is connected.
2 ZERO_PACK_ EN	Dummy Zero Packing Enable. This bit causes a dummy zero to be packed with every 3 incoming bytes, forming a 32-bit word. The dummy zero is always packed to the LSB position. This packing function is only available in 8-bit/pixel mode.  0 Zero packing disabled 1 Zero packing enabled

Table continues on the next page...

**CSI\_CSICR3 field descriptions (continued)**

Field	Description
1 ECC_INT_EN	Error Detection Interrupt Enable. This bit enables and disables the error detection interrupt. This feature only works in CCIR interlace mode.  0 No interrupt is generated when error is detected. Only the status bit ECC_INT is set. 1 Interrupt is generated when error is detected.
0 ECC_AUTO_EN	Automatic Error Correction Enable. This bit enables and disables the automatic error correction. If an error occurs and error correction is disabled only the ECC_INT status bit is set. This feature only works in CCIR interlace mode.  0 Auto Error correction is disabled. 1 Auto Error correction is enabled.

**19.7.4 CSI Statistic FIFO Register (CSI\_CSISTATFIFO)**

The StatFIFO is a read-only register containing statistic data from the sensor. Writing to this register has no effect.

Address: 21C\_4000h base + Ch offset = 21C\_400Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### CSI\_CSIRIFO field descriptions

Field	Description
IMAGE	Received image data

## 19.7.6 CSI RX Count Register (CSI\_CSIRXCNT)

This register works for EOF interrupt generation. It should be set to the number of words to receive that would generate an EOF interrupt.

There is an internal counter that counts the number of words read from the RX FIFO. Whenever the RX FIFO is being read, by either the CPU or the embedded DMA controller, the counter value is updated and compared with this register. If the values match, then an EOF interrupt is triggered.

Address: 21C\_4000h base + 14h offset = 21C\_4014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	1	0	1	1	0	0	0	0	0	0		

### CSI\_CSIRXCNT field descriptions

Field	Description
31–22 -	This field is reserved. Reserved. These bits are reserved and should read 0.
RXCNT	RxFIFO Count. This 22-bit counter for RxFIFO is updated each time the RxFIFO is read by CPU or DMA. This counter should be set to the expected number of words to receive that would generate an EOF interrupt.

## 19.7.7 CSI Status Register (CSI\_CSISR)

This read/write register shows sensor interface status, and which kind of interrupt is being generated. The corresponding interrupt bits must be set for the status bit to function. Status bits should function normally even if the corresponding interrupt enable bits are not enabled.

Address: 21C\_4000h base + 18h offset = 21C\_4018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	-	-	-	BASEADDR_CHCHANGE_ERROR	DMA_FIELD0_DONE	DMA_FIELD1_DONE	SF_OR_INT	RF_OR_INT	Reserved	DMA_TSF_DONE_SFF	STATFF_INT	DMA_TSF_DONE_FBF2	DMA_TSF_DONE_FBF1	RxFF_INT	EOF_INT	SOF_INT
W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	F2_INT	F1_INT	COF_INT	Reserved					HRESP_ERR_INT	Reserved					ECC_INT	DRDY
W	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Reset	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CSI\_CSISR field descriptions**

Field	Description
31–29 -	Reserved. These bits are reserved and should read 0.
28 BASEADDR_CHCHANGE_ERROR	When using base address switching enable, this bit will be 1 when switching occur before DMA complete. This bit will be clear by writing 1. When this interrupt happens, follow the steps listed below. 1. Unassert the CSI enable, CSIx_CSICR18 bit31, 2. Reflash the DMA, assert the CSIX_CSICR3 bit 14, 3. Assert the CSI enable, CSIx_CSICR18 bit31.
27 DMA_FIELD0_DONE	When DMA field 0 is complete, this bit will be set to 1(clear by writing 1).

*Table continues on the next page...*

**CSI\_CSISR field descriptions (continued)**

Field	Description
26 DMA_FIELD1_ DONE	When DMA field 0 is complete, this bit will be set to 1 (clear by writing 1).
25 SF_OR_INT	STATFIFO Overrun Interrupt Status. Indicates the overflow status of the STATFIFO register. (Cleared by writing 1)  0 STATFIFO has not overflowed. 1 STATFIFO has overflowed.
24 RF_OR_INT	RxFIFO Overrun Interrupt Status. Indicates the overflow status of the RxFIFO register. (Cleared by writing 1)  0 RxFIFO has not overflowed. 1 RxFIFO has overflowed.
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 DMA_TSF_ DONE_SFF	DMA Transfer Done from StatFIFO. Indicates that the dma transfer from StatFIFO is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the StatFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
21 STATFF_INT	STATFIFO Full Interrupt Status. Indicates the number of data in the STATFIFO reaches the trigger level. (this bit is cleared automatically by reading the STATFIFO)  0 STATFIFO is not full. 1 STATFIFO is full.
20 DMA_TSF_ DONE_FB2	DMA Transfer Done in Frame Buffer2. Indicates that the DMA transfer from RxFIFO to Frame Buffer2 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
19 DMA_TSF_ DONE_FB1	DMA Transfer Done in Frame Buffer1. Indicates that the DMA transfer from RxFIFO to Frame Buffer1 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
18 RxFF_INT	RxFIFO Full Interrupt Status. Indicates the number of data in the RxFIFO reaches the trigger level. (this bit is cleared automatically by reading the RxFIFO)  0 RxFIFO is not full. 1 RxFIFO is full.
17 EOF_INT	End of Frame (EOF) Interrupt Status. Indicates when EOF is detected. (Cleared by writing 1)  0 EOF is not detected. 1 EOF is detected.
16 SOF_INT	Start of Frame Interrupt Status. Indicates when SOF is detected. (Cleared by writing 1)

*Table continues on the next page...*

**CSI\_CSISR field descriptions (continued)**

Field	Description
	<p>0 SOF is not detected. 1 SOF is detected.</p>
15 F2_INT	<p>CCIR Field 2 Interrupt Status. Indicates the presence of field 2 of video in CCIR mode. (Cleared automatically when current field does not match)</p> <p><b>NOTE:</b> Only works in CCIR Interlace mode.</p> <p>0 Field 2 of video is not detected 1 Field 2 of video is about to start</p>
14 F1_INT	<p>CCIR Field 1 Interrupt Status. Indicates the presence of field 1 of video in CCIR mode. (Cleared automatically when current field does not match)</p> <p><b>NOTE:</b> Only works in CCIR Interlace mode.</p> <p>0 Field 1 of video is not detected. 1 Field 1 of video is about to start.</p>
13 COF_INT	<p>Change Of Field Interrupt Status. Indicates that a change of the video field has been detected. Only works in CCIR Interlace mode. Software should read this bit first and then dispatch the new field from F1_INT and F2_INT. (Cleared by writing 1)</p> <p>0 Video field has no change. 1 Change of video field is detected.</p>
12–8 -	<p>This field is reserved. Reserved. These bits are reserved and should read 0.</p>
7 HRESP_ERR_INT	<p>Hresponse Error Interrupt Status. Indicates that a hresponse error has been detected. (Cleared by writing 1)</p> <p>0 No hresponse error. 1 Hresponse error is detected.</p>
6–2 -	<p>This field is reserved. Reserved. These bits are reserved and should read 0.</p>
1 ECC_INT	<p>CCIR Error Interrupt. This bit indicates an error has occurred. This only works in CCIR Interlace mode. (Cleared by writing 1)</p> <p>0 No error detected 1 Error is detected in CCIR coding</p>
0 DRDY	<p>RXFIFO Data Ready. Indicates the presence of data that is ready for transfer in the RxFIFO. (Cleared automatically by reading FIFO)</p> <p>0 No data (word) is ready 1 At least 1 datum (word) is ready in RXFIFO.</p>

### 19.7.8 CSI DMA Start Address Register - for STATFIFO (CSI\_CSIDMASA\_STATFIFO)

This register provides the start address for the embedded DMA controller of STATFIFO. The embedded DMA controller will read data from STATFIFO and write it to the external memory from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C\_4000h base + 20h offset = 21C\_4020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

#### CSI\_CSIDMASA\_STATFIFO field descriptions

Field	Description
31–2 DMA_START_ ADDR_SFF	DMA Start Address for STATFIFO. Indicates the start address to write data. The embedded DMA controller will read data from STATFIFO and write it from this address through AHB bus. The address should be aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

### 19.7.9 CSI DMA Transfer Size Register - for STATFIFO (CSI\_CSIDMATS\_STATFIFO)

This register provides the total transfer size for the embedded DMA controller of STATFIFO. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C\_4000h base + 24h offset = 21C\_4024h

### CSI\_CSIDMATS\_STATFIFO field descriptions

Field	Description
DMA_TSFSIZE_SFF	DMA Transfer Size for STATFIFO. Indicates how many words to be transferred by the embedded DMA controller. The size should be aligned.

### 19.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSI\_CSIDMASA\_FB1)

This register provides the start address in the frame buffer1 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer1 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C\_4000h base + 28h offset = 21C\_4028h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

### CSI\_CSIDMASA\_FB1 field descriptions

Field	Description
31–2 DMA_START_ ADDR_FB1	DMA Start Address in Frame Buffer1. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

### 19.7.11 CSI DMA Transfer Size Register - for Frame Buffer2 (CSI\_CSIDMASA\_FB2)

This register provides the start address in the frame buffer2 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer2 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C\_4000h base + 2Ch offset = 21C\_402Ch

#### CSI\_CSIDMASA\_FB2 field descriptions

Field	Description
31–2 DMA_START_ ADDR_FB2	DMA Start Address in Frame Buffer2. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

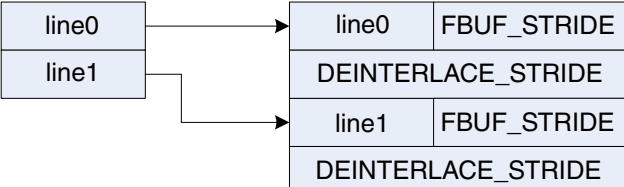

### 19.7.12 CSI Frame Buffer Parameter Register (CSI\_CSIFBUF\_PARA)

This register provides the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. The width of the frame buffer minus the width of the image is the stride. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C\_4000h base + 30h offset = 21C\_4030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CSI\_CSIFBUF\_PARA field descriptions

Field	Description
31–16 DEINTERLACE_STRIDE	DEINTERLACE_STRIDE is only used in the deinterlace mode. If line stride feature is supported in deinterlace mode, FBUF_STRIDE and DEINTERLACE_STRIDE need to be configured at the same time. DEINTERLACE_STRIDE is configured the same as line width. In normal line stride feature, only FBUF_STRIDE needs to be configured.  
FBUF_STRIDE	Frame Buffer Parameter. Indicates the stride of the frame buffer. The width of the frame buffer(in ) minus the width of the image(in ) is the stride. The stride should be aligned. The embedded DMA controller will skip the stride before starting to write the next row of the image.

### 19.7.13 CSI Image Parameter Register (CSI\_CSIIMAG\_PARA)

This register provides the width and the height of the image from the sensor. The width and height should be aligned in pixel. The width of the image multiplied by the height is the total pixel size that will be transferred in a frame by the embedded DMA controller. This register should be configured before activating or restarting the embedded DMA controller.

Address: 21C\_4000h base + 34h offset = 21C\_4034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																

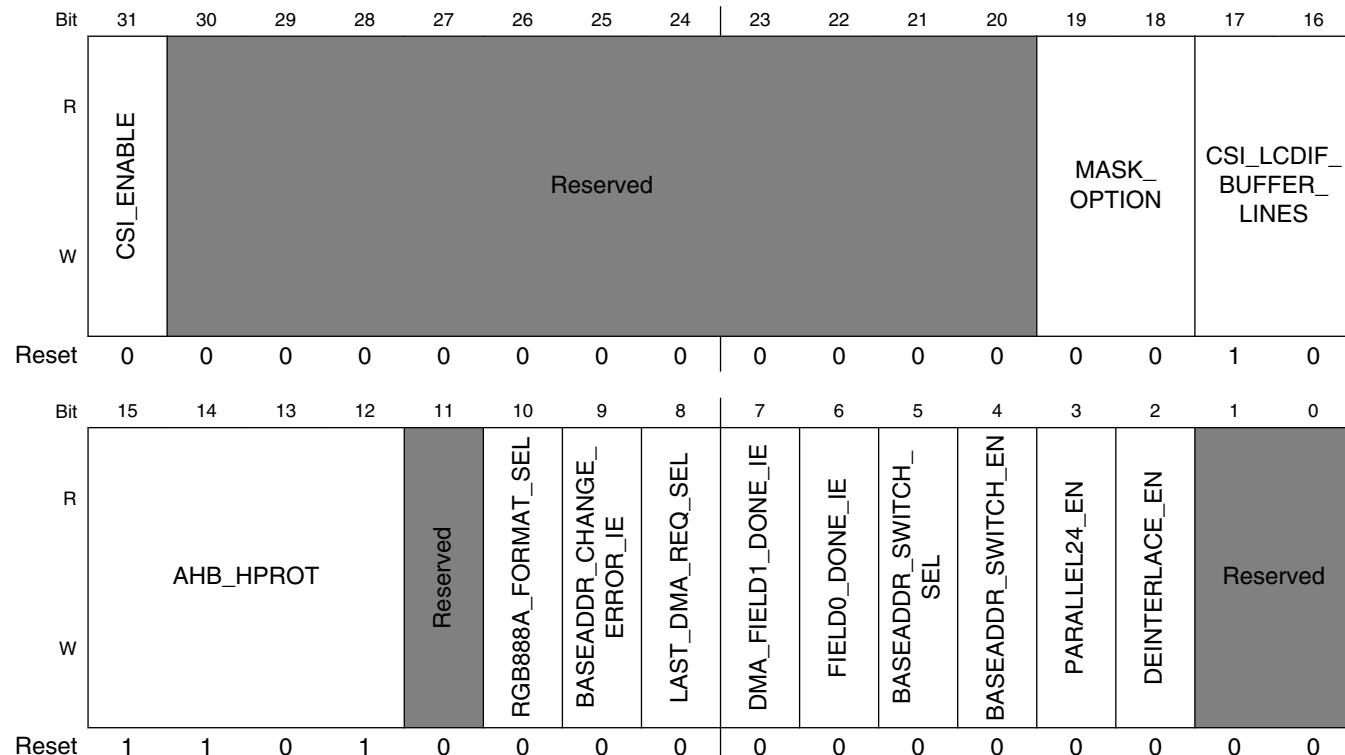

### CSI\_CSIIMAG\_PARA field descriptions

Field	Description
31–16 IMAGE_WIDTH	Image Width. Indicates how many pixels in a line of the image from the sensor. If the input data from the sensor is 8-bit/pixel format, the IMAGE_WIDTH should be a multiple of pixels. If the input data from the sensor is 10-bit/pixel or 16-bit/pixel format, the IMAGE_WIDTH should be a multiple of pixels.
IMAGE_HEIGHT	Image Height. Indicates how many pixels in a column of the image from the sensor.

## 19.7.14 CSI Control Register 18 (CSI\_CSICR18)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 21C\_4000h base + 48h offset = 21C\_4048h

### CSI\_CSICR18 field descriptions

Field	Description
31 CSI_ENABLE	CSI global enable signal. Only when this bit is 1, CSI can start to receive the data and store to memory.
30–20 -	This field is reserved.
19–18 MASK_OPTION	<p>These bits used to choose the method to mask the CSI input.</p> <ul style="list-style-type: none"> <li>00 Writing to memory from first completely frame, when using this option, the CSI_ENABLE should be 1.</li> <li>01 Writing to memory when CSI_ENABLE is 1.</li> <li>02 Writing to memory from second completely frame, when using this option, the CSI_ENABLE should be 1.</li> <li>03 Writing to memory when data comes in, not matter the CSI_ENABLE is 1 or 0.</li> </ul>

Table continues on the next page...

**CSI\_CSICR18 field descriptions (continued)**

Field	Description
17–16 CSI_LCDIF_ BUFFER_LINES	The number of lines are used in handshake mode with LCDIF. 00 4 lines 01 8 lines 02 16 lines 03 16 lines
15–12 AHB_HPROT	Hprot value in AHB bus protocol.
11 -	This field is reserved.
10 RGB888A_ FORMAT_SEL	Output is 32-bit format. 0 {8'h0, data[23:0]} 1 {data[23:0], 8'h0}
9 BASEADDR_ CHANGE_ ERROR_IE	Base address change error interrupt enable signal.
8 LAST_DMA_ REQ_SEL	Choosing the last DMA request condition. 0 fifo_full_level 1 hburst_length
7 DMA_FIELD1_ DONE_IE	When in interlace mode, field 1 done interrupt enable. 0 Interrupt disabled 1 Interrupt enabled
6 FIELD0_DONE_ IE	In interlace mode, field 0 means interrupt enabled. 0 Interrupt disabled 1 Interrupt enabled
5 BASEADDR_ SWITCH_SEL	CSI 2 base addresses switching method. When using this bit, BASEADDR_SWITCH_EN is 1. 0 Switching base address at the edge of the vsync 1 Switching base address at the edge of the first data of each frame
4 BASEADDR_ SWITCH_EN	When this bit is enabled, CSI DMA will switch the base address according to BASEADDR_SWITCH_SEL rather than atomically by DMA completed.
3 PARALLEL24_ EN	When input is parallel rgb888/yuv444 24bit, this bit can be enabled.
2 DEINTERLACE_ EN	This bit is used to select the output method When input is standard CCIR656 video. 0 Deinterlace disabled 1 Deinterlace enabled
-	This field is reserved. Reserved.

## 19.7.15 CSI Control Register 19 (CSI\_CSICR19)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 21C\_4000h base + 4Ch offset = 21C\_404Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved																								DMA_RFIFO_HIGHEST_FIFO_LEVEL							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### CSI\_CSICR19 field descriptions

Field	Description
31–8 -	This field is reserved.
DMA_RFIFO_HIGHEST_FIFO_LEVEL	This byte stores the highest FIFO level achieved by CSI FIFO timely and will be clear by writing 8'ff to it.

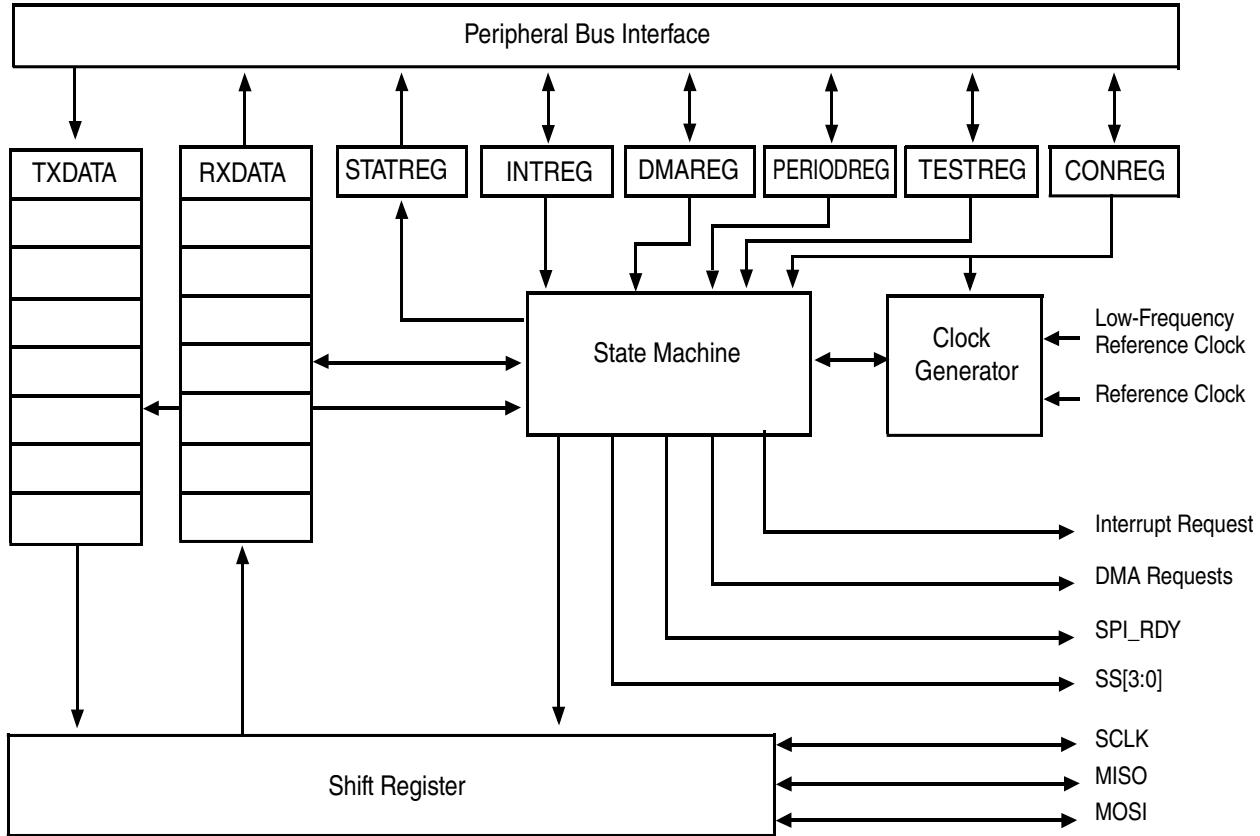

# **Chapter 20**

## **Enhanced Configurable SPI (ECSPI)**

### **20.1 Overview**

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

**Figure 20-1. ECSPI Block Diagram**

### 20.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

## 20.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

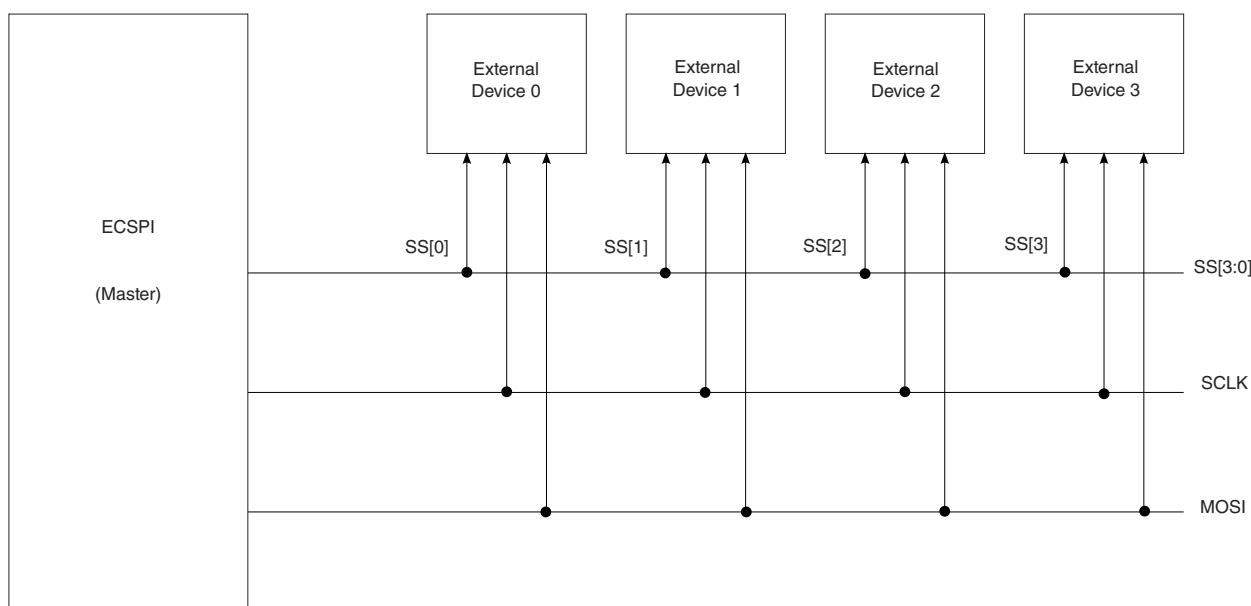

- Master Mode
- Slave Mode
- Low Power Modes

As described in [Operations](#), the ECSPI supports the operations described in the indicated sections:

- Typical Master Mode
  - Master Mode with SPI\_RDY
  - Master Mode with Wait States
  - Master Mode with SS\_CTL[3:0] Control
  - Master Mode with Phase Control
- Typical Slave Mode

## 20.2 External Signals

[Figure 20-2](#) shows the ECSPI in master mode connected to four external devices in a one-way communication link.

**Figure 20-2. Example Connection Diagram**

## 20.3 Clocks

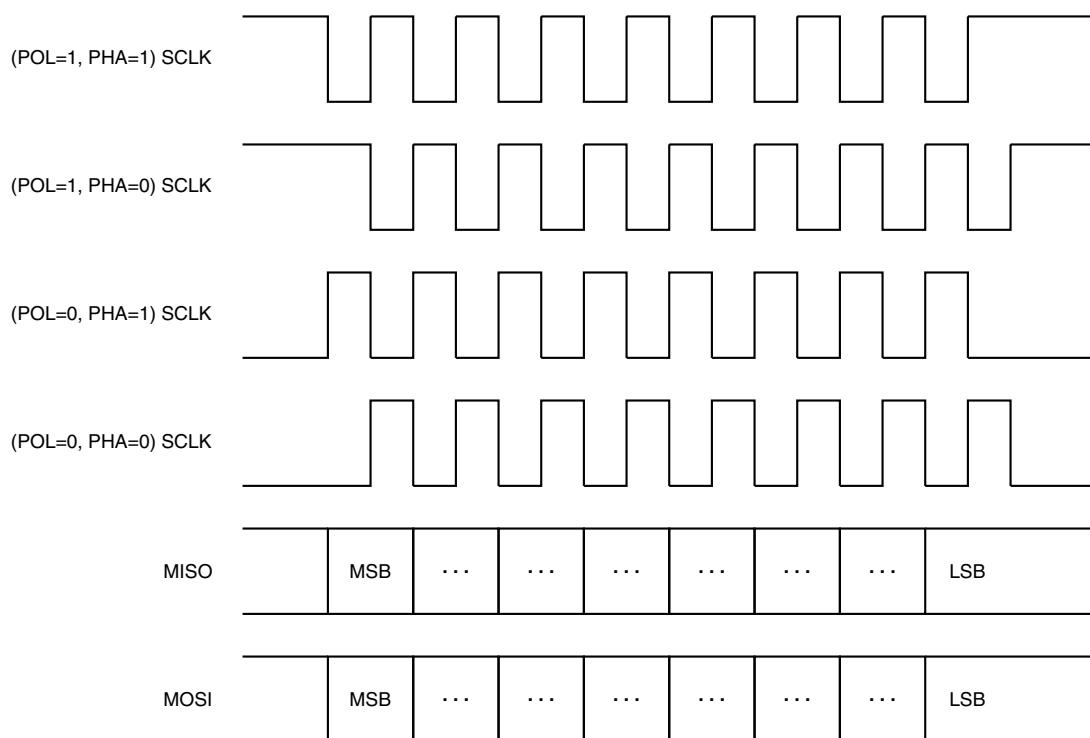

The following table describes the clock sources for eCSPI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 20-1. eCSPI Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 20.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

**Figure 20-3. ECSPI SCLK, MISO, and MOSI Relationship**

### 20.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI\_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

### 20.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select ( $\overline{SS}$ ) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when ECSPIx\_CONFIGREG[SS\_CTL] is cleared. The accurate burst length should always be specified using the BURST\_LENGTH parameter. ECSPIx\_CONFIGREG[SS\_CTL] set to 1 is not supported in slave mode.

### 20.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

### 20.4.4 Operations

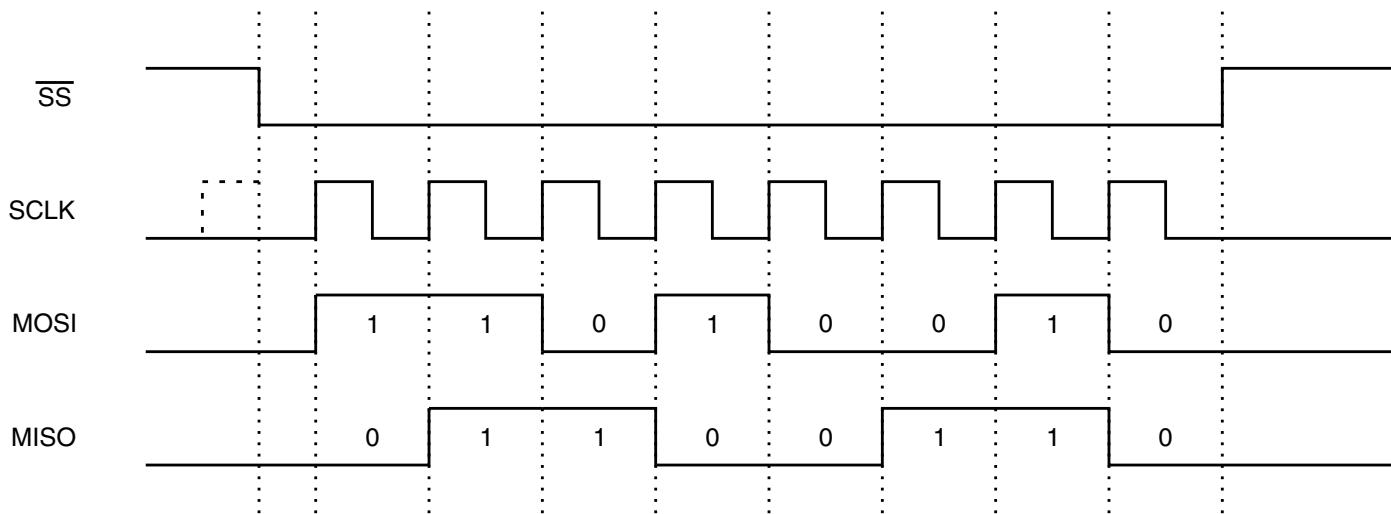

The information found here describes the ECSPI's operations.

### 20.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI\_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI\_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

**Figure 20-4. Typical SPI Burst (8-bit Transfer)**

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

#### 20.4.4.1.1 Master Mode with SPI\_RDY

By default, the ECSPI does not use the SPI\_RDY signal in master mode (MODE =1).

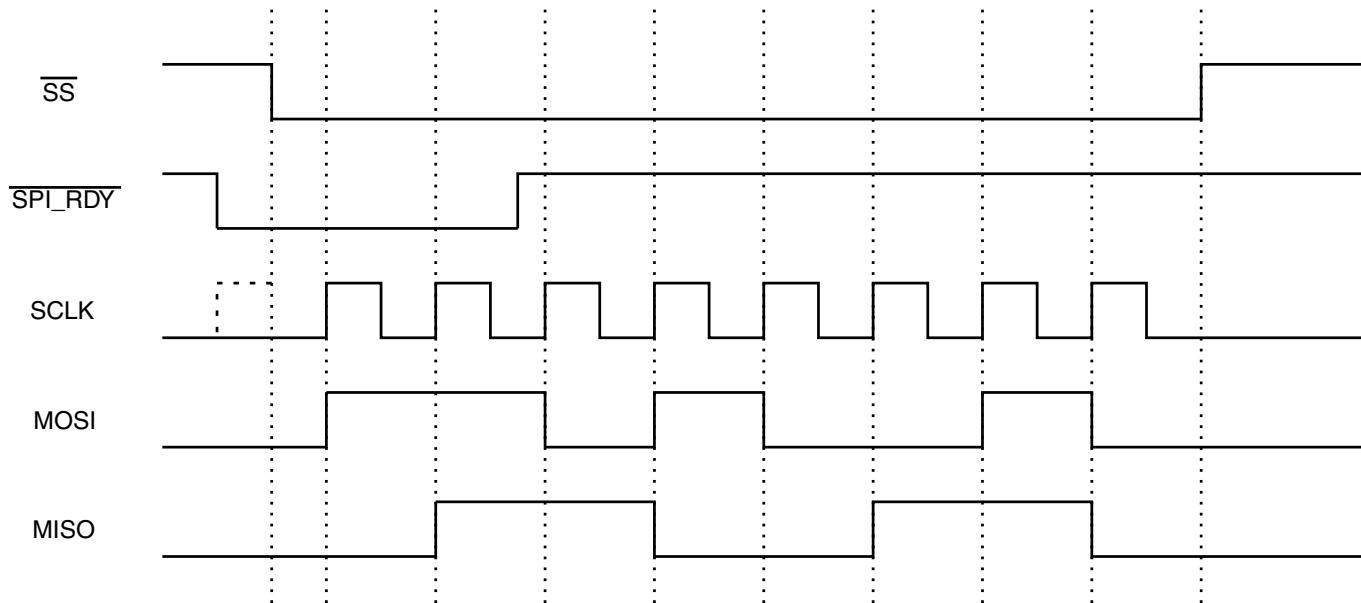

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI\_CONREG[XCH] bit or the ECSPI\_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI\_CONREG[DRCTL]) bits contains either 01 or 10, the SPI\_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI\_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI\_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI\_RDY signal.

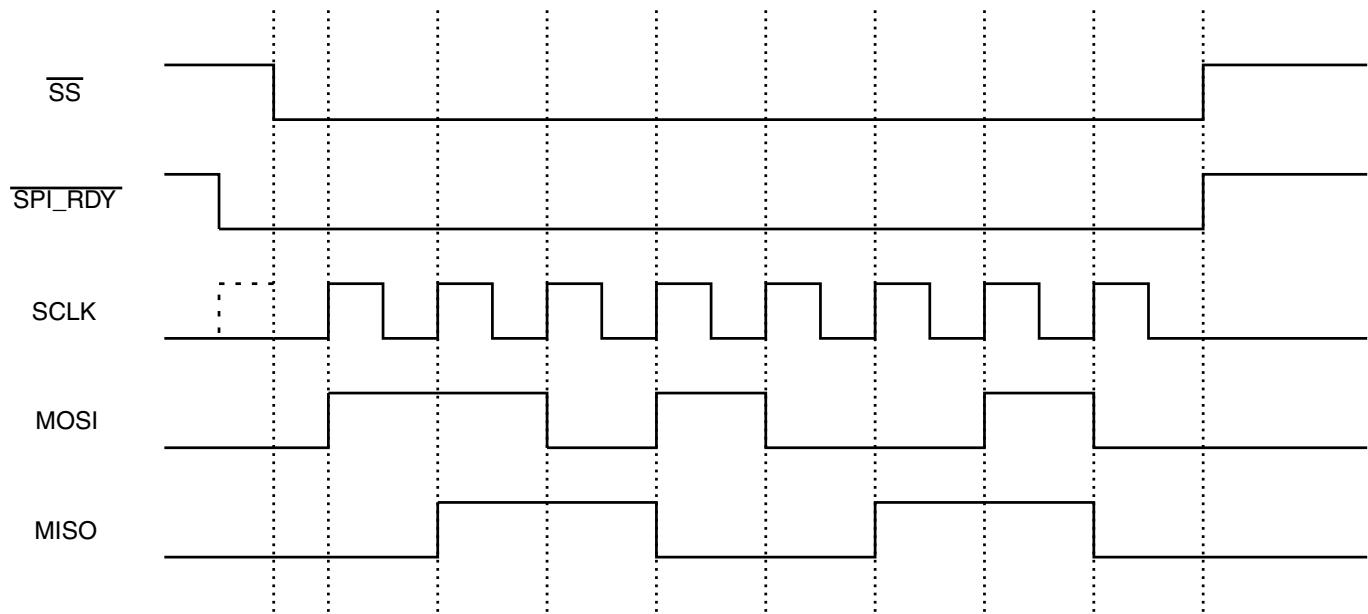

**Figure 20-5. Relationship Between a SPI Burst and SPI\_RDY: Falling-Edge Triggered**

A SPI burst does not start until the falling edge of the SPI\_RDY signal is detected. The next SPI burst starts when the next SPI\_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI\_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI\_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI\_RDY signal. The SPI burst does not begin until the SPI\_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI\_RDY signal remains low.

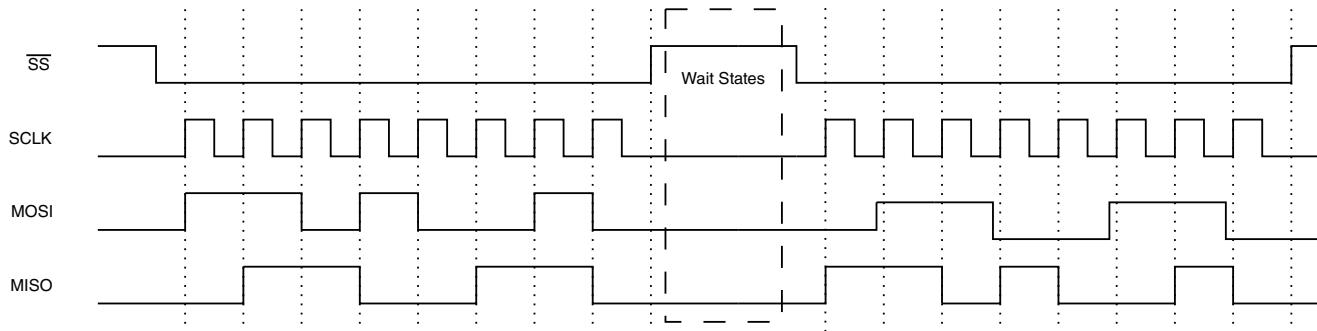

**Figure 20-6. Relationship Between a SPI Burst and SPI\_RDY: Low-Level Triggered**

#### 20.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

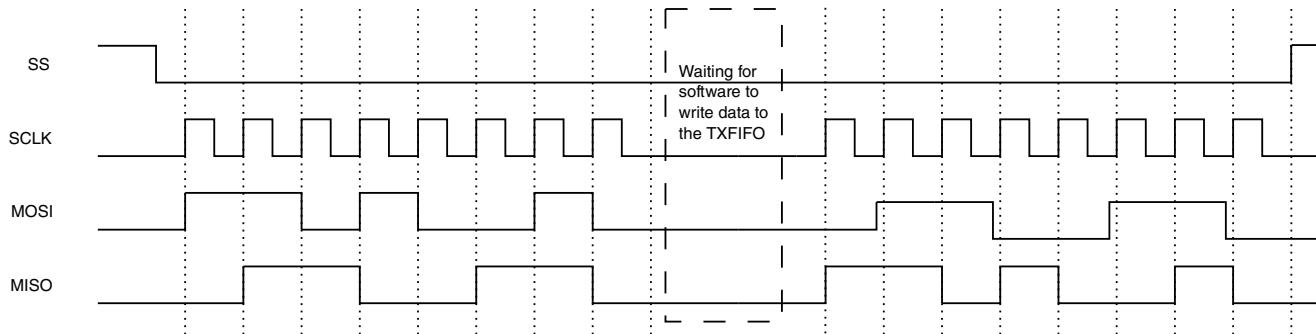

**Figure 20-7. SPI Bursts with Wait States**

In this case, the number of wait states is controlled by ECSPI\_PERIODREG[SAMPLE PERIOD] and the wait states' clock source is selected by ECSPI\_PERIODREG[CSRC].

#### 20.4.4.1.3 Master Mode with SS\_CTL[3:0] Control

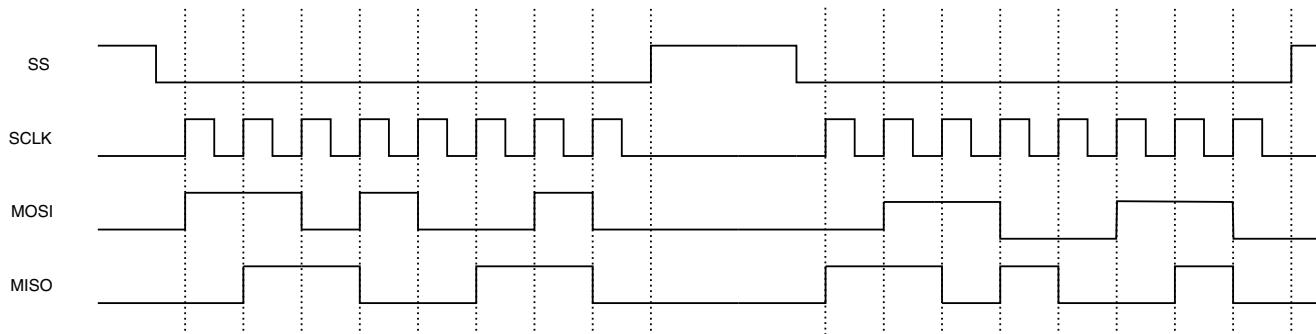

The SPI SS Control (SS\_CTL[3:0]) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS\_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS\_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI\_CONREG register.

**Figure 20-8. SPI Burst While SS\_CTL[3:0] is Clear**

In [Figure 20-8](#), two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined by the BURST LENGTH and limited by the FIFO size. ([Figure 20-8](#) corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

**Figure 20-9. SPI Bursts While SS\_CTL[3:0] is Set**

In [Figure 20-9](#), two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

#### 20.4.4.1.4 Master Mode with Phase Control

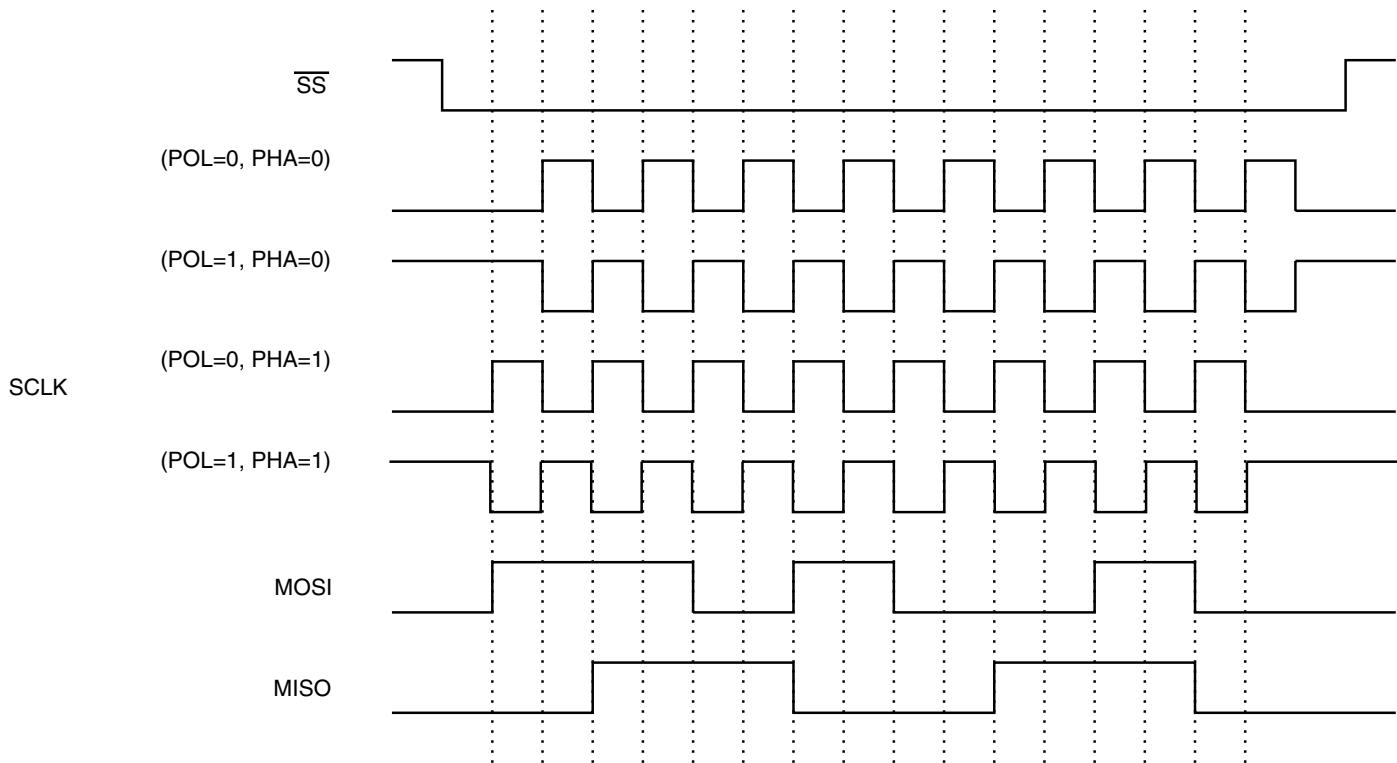

The Phase Control (ECSPI\_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

## Functional Description

When the Phase control (ECSPI\_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI\_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. [Figure 20-10](#) shows how SPI burst works with different POL and PHA configuration.

**Figure 20-10. SPI Burst with Different POL and PHA Configurations**

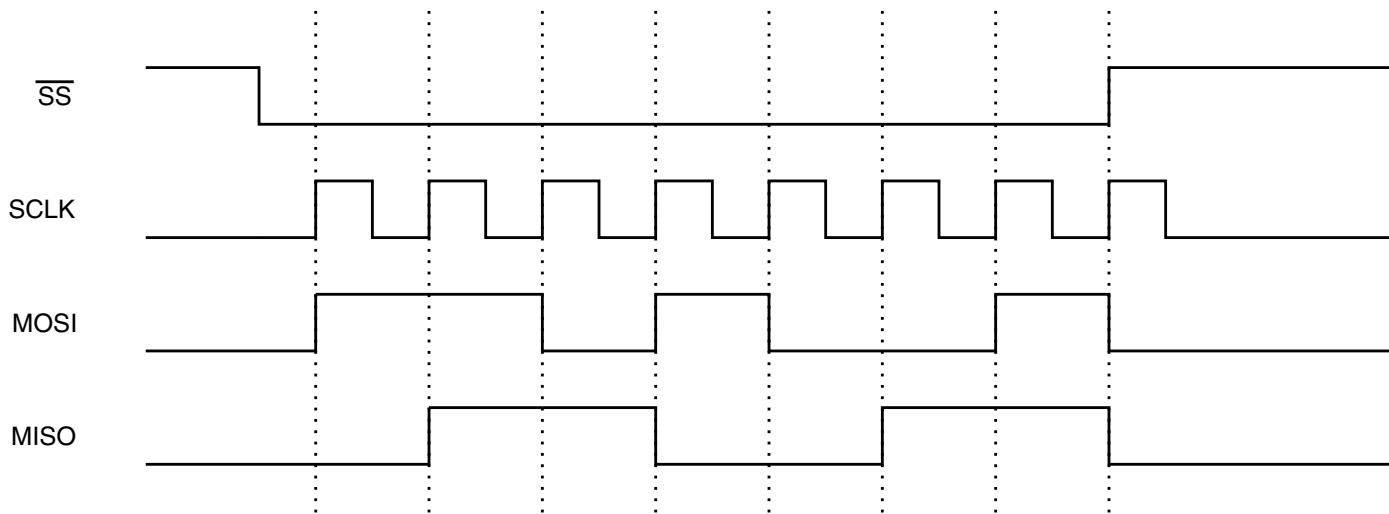

### 20.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration, SS becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS\_POL=0 is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SS\_POL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

**Figure 20-11. Advancing the Data FIFO on the Rising Edge of  $\overline{SS}$**

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

## 20.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see [ECSPI](#).

## 20.4.6 Interrupts

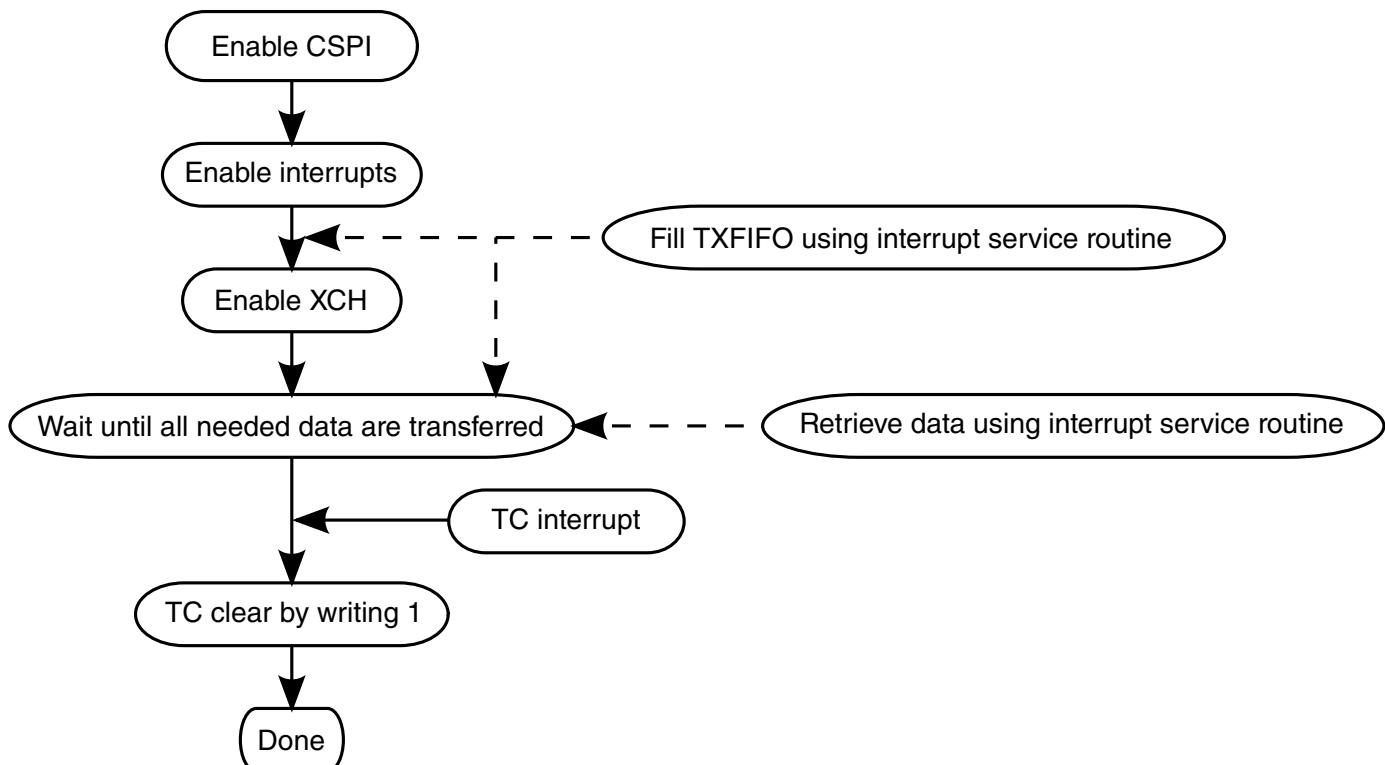

Interrupt control provides a way to manage the ECSPI FIFOs:

## Functional Description

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

**Figure 20-12. Program Sequence of SPI Burst Using Interrupt Control**

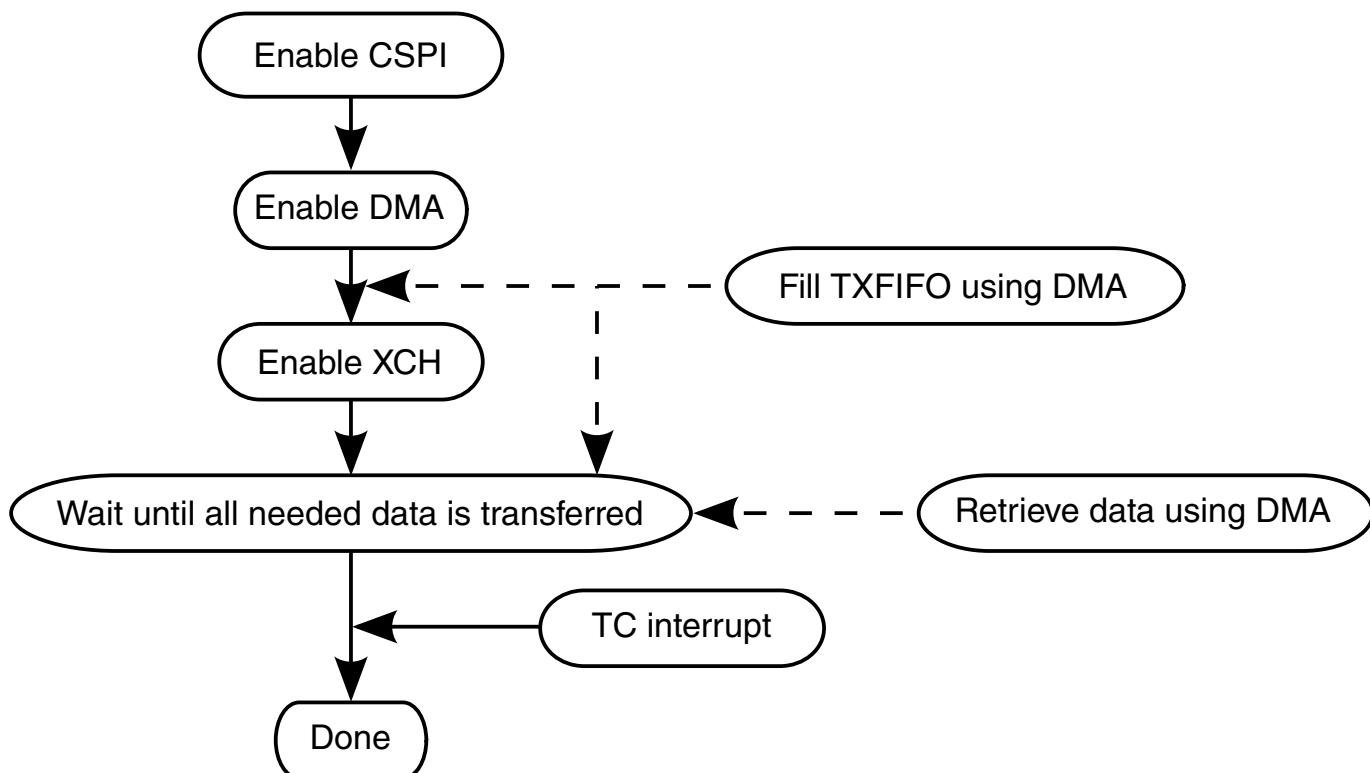

## 20.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

**Figure 20-13. Program Sequence of SPI Burst Using DMA**

## 20.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

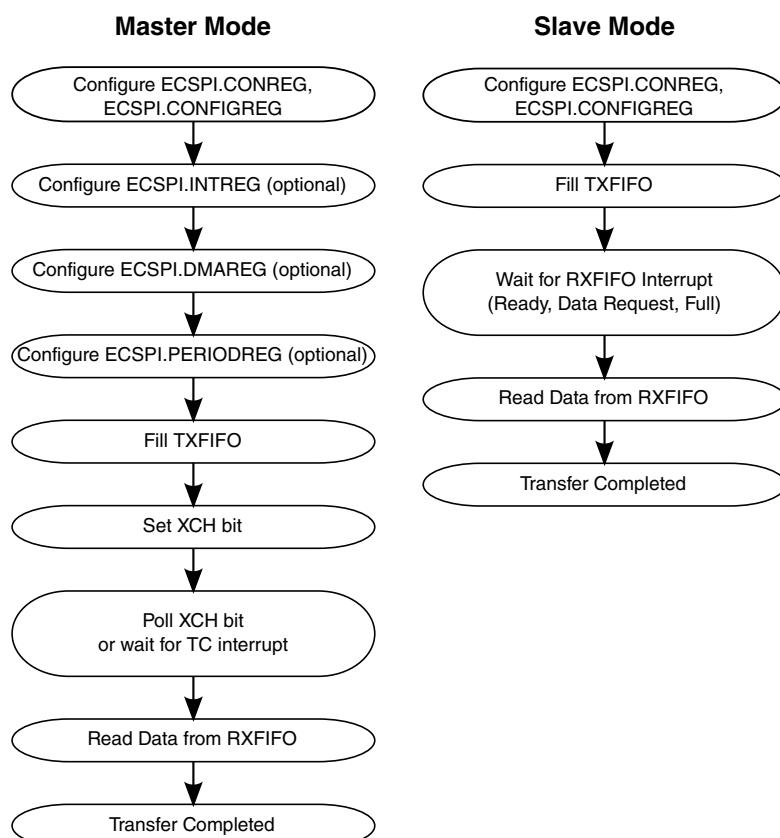

## 20.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI\_CONREG to reset the block.
2. Enable the clocks for ECSPI within the CCM.
3. Configure the Control Register and then set the EN bit in the ECSPI\_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

## 20.6 Applications

**Figure 20-14. Flowchart of the ECSPI Operation**

## 20.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

**ECSPI memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

## 20.7.1 Receive Data Register (ECSPIx\_RXDATA)

The Receive Data register (ECSPI\_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

### ECSPIx\_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

## 20.7.2 Transmit Data Register (ECSPIx\_TXDATA)

The Transmit Data (ECSPI\_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI\_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI\_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ECSPIx\_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BURST_LENGTH field of the corresponding SPI Control register. If this field contains more bits than the number specified by BURST_LENGTH, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

## 20.7.3 Control Register (ECSPIx\_CONREG)

The Control Register (ECSPI\_CONREG) allows software to enable the ECSPI , configure its operating modes, specify the divider value, and SPI\_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

**ECSPIx\_CONREG field descriptions**

Field	Description
31–20 BURST_LENGTH	<p>Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of <math>2^{12}</math> bits can be transferred in a single SPI burst.</p> <p>In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant (<math>n = \text{BURST LENGTH} + 1</math>) will be shifted out. The remaining bits will be ignored.</p> <p>Number of Valid Bits in a SPI burst.</p> <ul style="list-style-type: none"> <li>0x000 A SPI burst contains the 1 LSB in a word.</li> <li>0x001 A SPI burst contains the 2 LSB in a word.</li> <li>0x002 A SPI burst contains the 3 LSB in a word.</li> <li>...</li> <li>0x01F A SPI burst contains all 32 bits in a word.</li> <li>0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word.</li> <li>0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word.</li> <li>...</li> <li>0xFFE A SPI burst contains the 31 LSB in first word and <math>2^7 - 1</math> words.</li> <li>0xFFFF A SPI burst contains <math>2^7</math> words.</li> </ul>
19–18 CHANNEL_SELECT	<p>SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SSn) outputs. Only the selected Chip Select (SSn) signal can be active at a given time; the remaining three signals will be negated.</p> <ul style="list-style-type: none"> <li>00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted.</li> <li>01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted.</li> <li>10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted.</li> <li>11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.</li> </ul>
17–16 DRCTL	<p>SPI Data Ready Control. This field selects the utilization of the SPI_RDY signal in master mode. ECSPI checks this field before it starts an SPI burst.</p> <ul style="list-style-type: none"> <li>00 The SPI_RDY signal is a don't care.</li> <li>01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered).</li> <li>10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered).</li> <li>11 Reserved.</li> </ul>
15–12 PRE_DIVIDER	<p>SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock.</p> <ul style="list-style-type: none"> <li>0000 Divide by 1.</li> <li>0001 Divide by 2.</li> <li>0010 Divide by 3.</li> <li>...</li> <li>1101 Divide by 14.</li> <li>1110 Divide by 15.</li> <li>1111 Divide by 16.</li> </ul>
11–8 POST_DIVIDER	<p>SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: <math>2^n</math>.</p> <ul style="list-style-type: none"> <li>0000 Divide by 1.</li> <li>0001 Divide by 2.</li> </ul>

*Table continues on the next page...*

**ECSPIx\_CONREG field descriptions (continued)**

Field	Description
	<p>0010 Divide by 4.</p> <p>...</p> <p>1110 Divide by <math>2^{14}</math>.</p> <p>1111 Divide by <math>2^{15}</math>.</p>
7–4 CHANNEL_MODE	<p>SPI CHANNEL MODE selects the mode for each SPI channel.</p> <p>CHANNEL MODE[3] is for SPI channel 3.</p> <p>CHANNEL MODE[2] is for SPI channel 2.</p> <p>CHANNEL MODE[1] is for SPI channel 1.</p> <p>CHANNEL MODE[0] is for SPI channel 0.</p> <p>0 Slave mode.</p> <p>1 Master mode.</p>
3 SMC	<p>Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1).</p> <p>It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to.</p> <p>0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions.</p> <p>1 Immediately starts a SPI burst when data is written in TXFIFO.</p>
2 XCH	<p>SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1).</p> <p>If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out.</p> <p>0 Idle.</p> <p>1 Initiates exchange (write) or busy (read).</p>
1 HT	<p>Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode.</p> <p>Note, HT mode is not supported by this product.</p> <p>0 Disable HT mode.</p> <p>1 Enable HT mode.</p>
0 EN	<p>SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPI_CONREG. The block's internal clocks are gated off whenever the block is disabled.</p> <p>0 Disable the block.</p> <p>1 Enable the block.</p>

## 20.7.4 Config Register (ECSPIx\_CONFIGREG)

The Config Register (ECSPI\_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### ECSPIx\_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product.  The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel.  SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0.  0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel.  DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0.  0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal.  SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

**ECSPIx\_CONFIGREG field descriptions (continued)**

Field	Description
	<p>0 Active low. 1 Active high.</p>
11–8 SS_CTL	<p>SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set.</p> <p>SS CTL[3] is for SPI channel 3. SS CTL[2] is for SPI channel 2. SS CTL[1] is for SPI channel 1. SS CTL[0] is for SPI channel 0.</p> <p>In slave mode, this bit controls when the SPI burst is completed.</p> <p>An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> <p>0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty. 1 Reserved</p>
7–4 SCLK_POL	<p>SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See <a href="#">Figure 20-10</a> for more information.</p> <p>SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0.</p> <p>0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).</p>
SCLK_PHA	<p>SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See <a href="#">Figure 20-10</a> for more information.</p> <p>SCLK PHA[3] is for SPI channel 3. SCLK PHA[2] is for SPI channel 2. SCLK PHA[1] is for SPI channel 1. SCLK PHA[0] is for SPI channel 0.</p> <p>0 Phase 0 operation. 1 Phase 1 operation.</p>

## 20.7.5 Interrupt Control Register (ECSPIx\_INTREG)

The Interrupt Control Register (ECSPI\_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### ECSPIx\_INTREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

Table continues on the next page...

**ECSPIx\_INTREG field descriptions (continued)**

Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

**20.7.6 DMA Control Register (ECSPIx\_DMAREG)**

The Direct Memory Access Control Register (ECSPI\_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R

									TEDEN	Reserved						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ECSPIx\_DMAREG field descriptions**

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request/Interrupt Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request/interrupt is generated even if it is less than or equal to RX_THRESHOLD.  0 Disable 1 Enable
30 -	This field is reserved. Reserved
29–24 RX_DMA_LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request.  0 Disable 1 Enable
22 -	This field is reserved. Reserved
21–16 RX_THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request.  A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15–8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request.  0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request.  A TX DMA/INT request is issued when the number of data entries in the TXFIFO is not greater than TX_THRESHOLD.

## 20.7.7 Status Register (ECSPIx\_STATREG)

The ECSPI Status Register (ECSPI\_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000\_0003.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R

W									w1c	w1c						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

ECSPIx\_STATREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it.  0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it.  0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full.  0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request.  0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists.  0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO.  0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full.

Table continues on the next page...

**ECSPIx\_STATREG field descriptions (continued)**

Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of valid data slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of valid data slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

**20.7.8 Sample Period Control Register (ECSPIx\_PERIODREG)**

The Sample Period Control Register (ECSPI\_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPI\_CONREG[CHANNEL MODE] = 1). ECSPI\_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ECSPIx\_PERIODREG field descriptions**

Field	Description
31–22 -	This field is reserved. Reserved

*Table continues on the next page...*

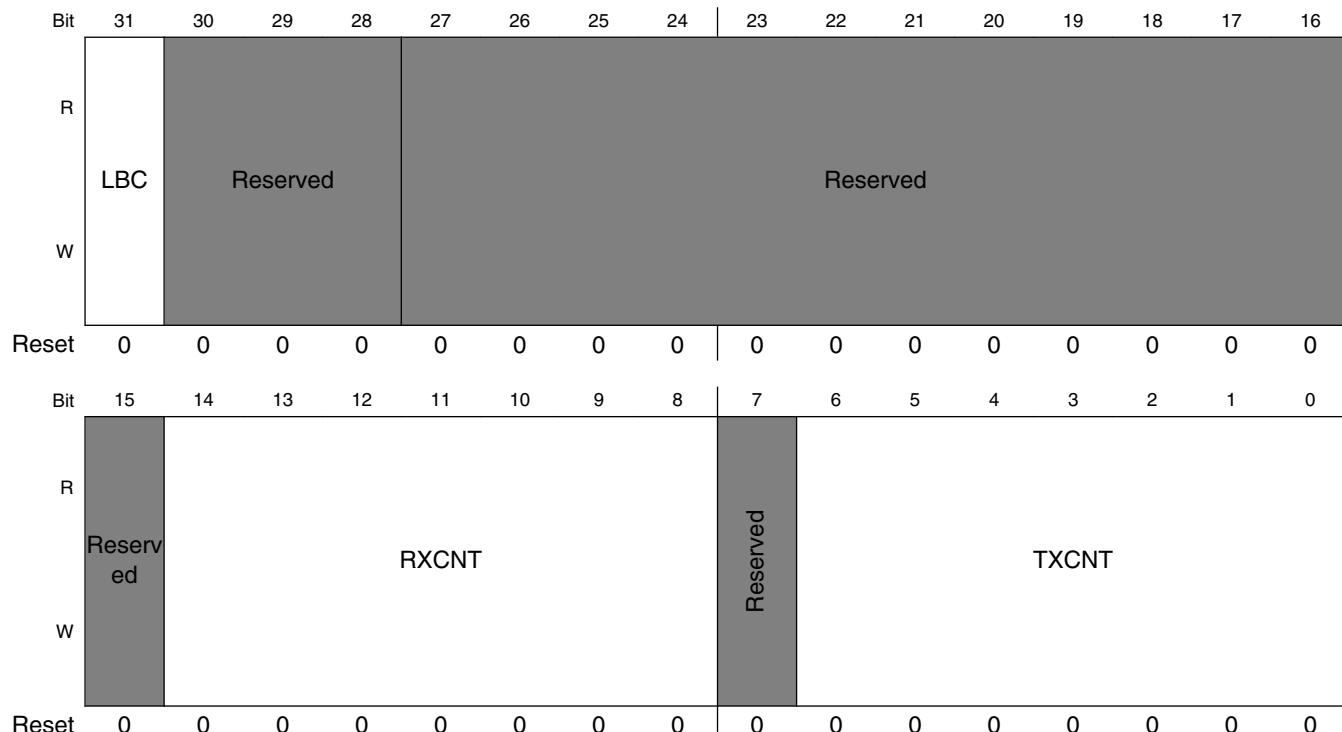

**ECSPIx\_PERIODREG field descriptions (continued)**

Field	Description
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter. 0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz)
SAMPLE_PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPI_CONREG register.  0x0000 0 wait states inserted 0x0001 1 wait state inserted ... ... 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

## 20.7.9 Test Control Register (ECSPIx\_TESTREG)

The Test Control Register (ECSPI\_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPI, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

**ECSPIx\_TESTREG field descriptions**

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored.  0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.

*Table continues on the next page...*

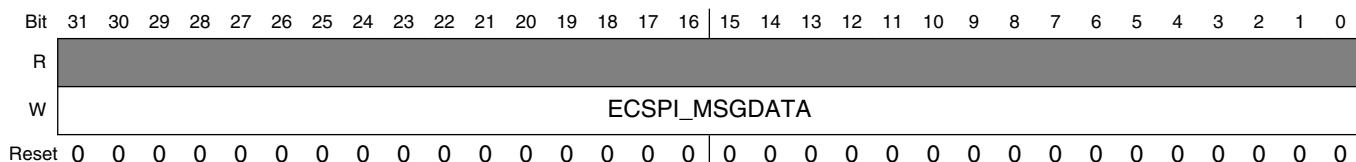

**ECSPIx\_TESTREG field descriptions (continued)**

Field	Description
7 -	This field is reserved. Reserved
TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

**20.7.10 Message Data Register (ECSPIx\_MSGDATA)**

The Message Data Register (ECSPI\_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reads to this register return zero, and writes to this register store data in the MSG Data FIFO.

Address: Base address + 40h offset

**ECSPIx\_MSGDATA field descriptions**

Field	Description
ECSPI_MSGDATA	ECSPI_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

# **Chapter 21**

## **External Interface Module (EIM)**

### **21.1 Overview**

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

## Overview

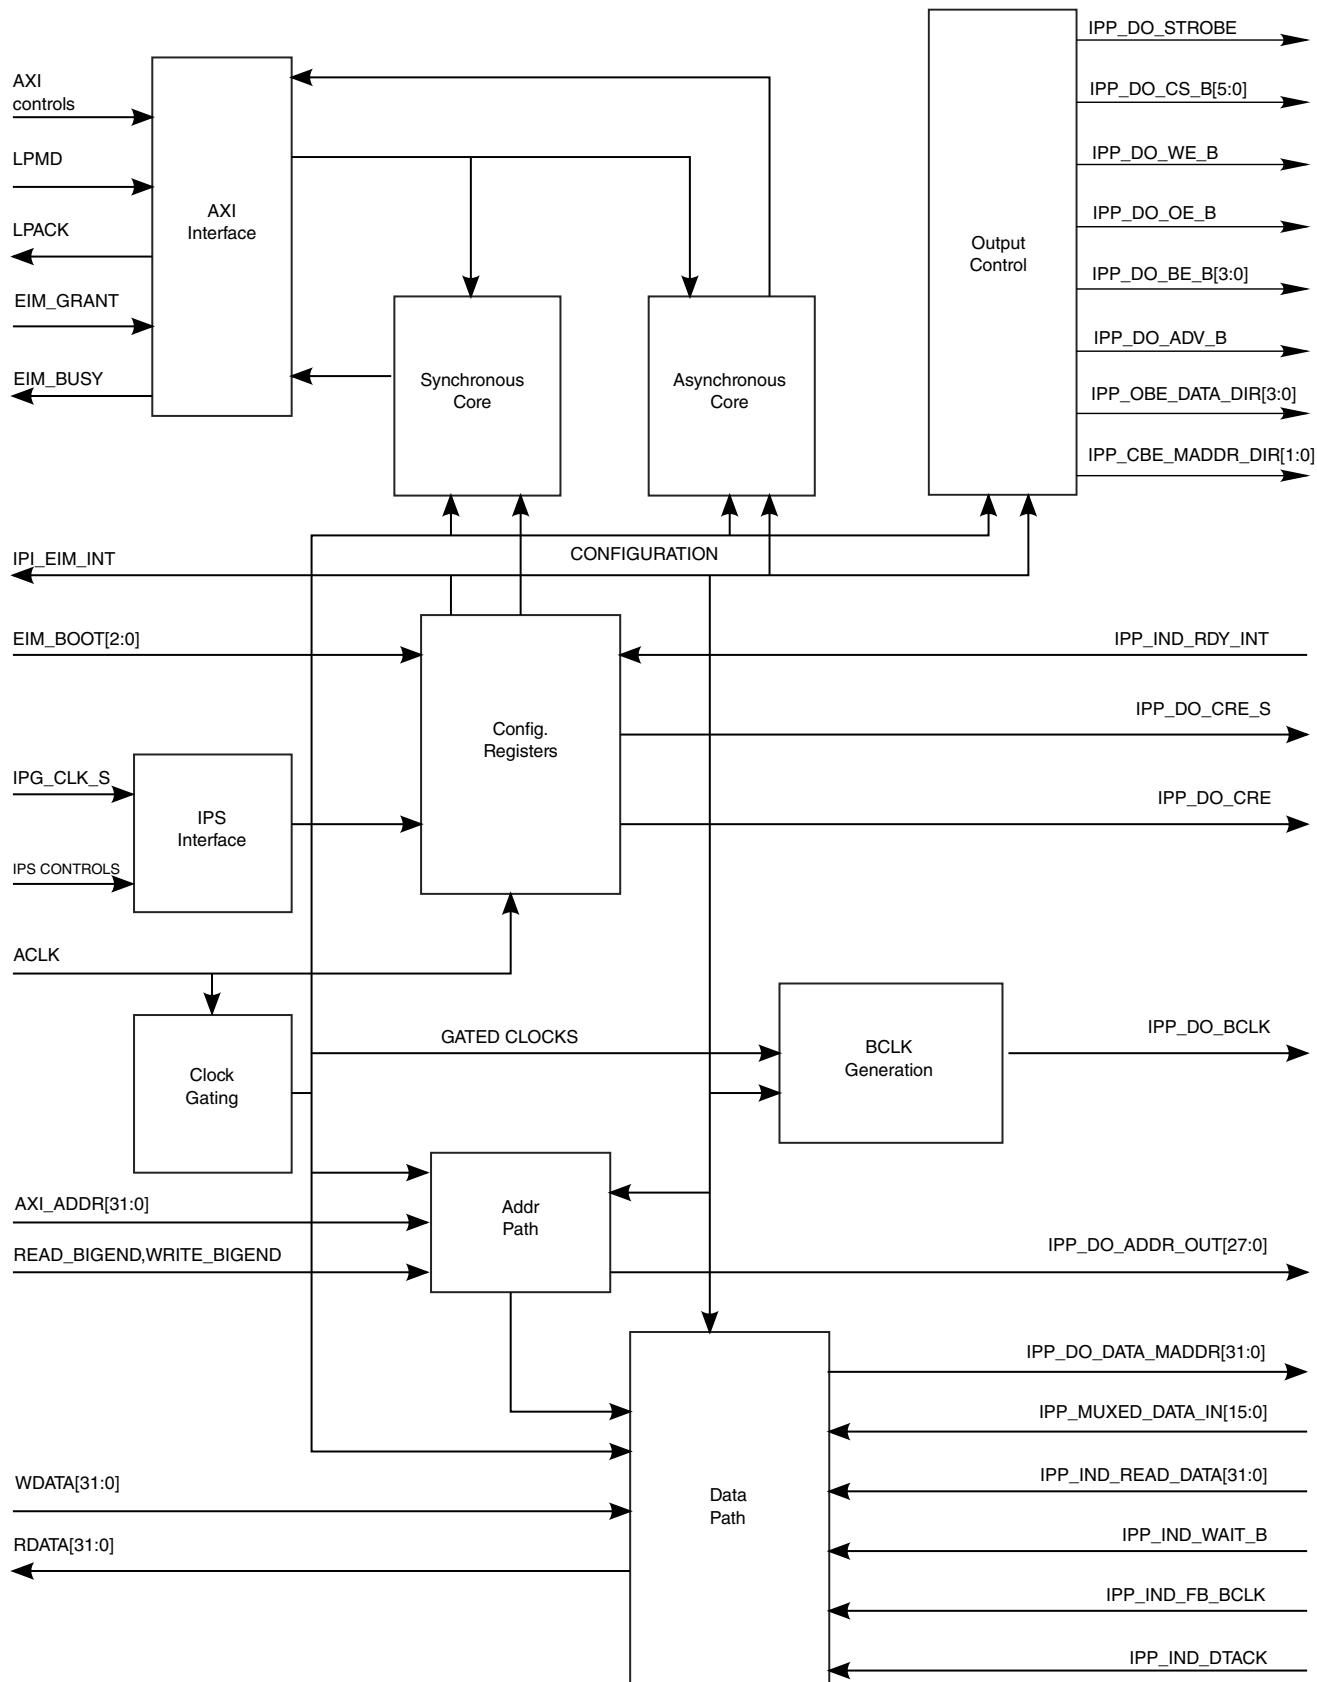

Figure 21-1. EIM Diagram

## 21.1.1 Features

- Six chip selects for external devices
  - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see [Chip Select Memory Map](#)). Configurable Chip Select 0 base address (by VIA)
  - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
  - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32 MBytes.
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 port size
- Programmable Data Port Size for each Chip Select (x8, x16)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 port size)
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- Arm AXI slave interface. One ID at a time support.

## 21.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode
- Multiplexed Address/Data mode
- Burst Clock Mode
- Low Power Modes
- Boot Mode

See details in the [EIM Operational Modes](#).

### 21.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

### 21.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

### 21.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16 data width memory devices.

For more information about the pins that drive data/address in 8/16 non-muxed mode and 16 muxed mode, see the following table.

**Table 21-1. EIM Multiplexing**

Setup	Non Multiplexed Addressss/Data Mode						Multiplexed Address/ Data Mode	
	8-Bit				16-Bit			
	NUM = 0, DSZ = 100	NUM = 0, DSZ = 101	NUM = 0, DSZ = 110	NUM = 0, DSZ = 111	NUM = 0, DSZ = 001	NUM = 0, DSZ = 010		
EIM_ADDR[1:5:0]	EIM_AD[15:0]	EIM_AD[15:0]	EIM_AD[15:0]	EIM_AD [15:0]	EIM_AD[15:0]	EIM_AD[15:0]	EIM_AD[15:0]	
EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	EIM_ADDR[2:6:16]	

*Table continues on the next page...*

**Table 21-1. EIM Multiplexing (continued)**

Setup	Non Multiplexed Addresss/Data Mode						Multiplexed Address/ Data Mode	
	8-Bit				16-Bit			
	NUM = 0, DSZ = 100	NUM = 0, DSZ = 101	NUM = 0, DSZ = 110	NUM = 0, DSZ = 111	NUM = 0, DSZ = 001	NUM = 0, DSZ = 010		
EIM_DATA[07 :00], EIM_EB0_B	EIM_DATA[07 :00]	-	Reserved	Reserved	EIM_DATA[07 :00]	Reserved	EIM_AD[07:00]

#### 21.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT\_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT\_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

#### NOTE

Maximum frequency of the EIM main clock is 133 MHz. It may be reduced by the system for special cases of external devices, which demand a different frequency than integer division of the 133 MHz clock.

### 21.1.2.5 Low Power Modes

The input clock is gated by ACT\_CS bits. When all the ACT\_CS are negated (all CS disable) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

### 21.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See for more details.

## 21.2 External Signals

The following table describes the external signals of EIM:

### 21.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals internal to the chip that are important in understanding the function of EIM.

**Table 21-2. EIM Important Internal Signals**

Name	I/O	Description
EIM_FB_BCLK	Input	Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device.
EIM_BOOT	Input	EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM.
ACLK	Input	AXI clock, maximum frequency 133 Mhz
IPG_CLK_S	Input	EIM module IPG clock
RST_B	Input	Active low HW reset
EIM_WARM_RESET	Input	Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal.

## 21.3 Clocks

The following table describes the clock sources for EIM. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 21-3. EIM Clocks**

Clock name	Clock Root	Description
aclk	aclk_eim_slow_clk_root	EIM clock (main)
aclk_slow	aclk_eim_slow_clk_root	EIM clock (slow)
ipg_clk_s	ipg_clk_root	Peripheral access clock
aclk_exsc	aclk_eim_slow_clk_root	EIM clock (external device)

- ACLK: EIM clock (main clock, AXI clock) with a Max frequency of 133 MHz. Can be gated externally when there is no active AXI access.
- ACLK\_SLOW: EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmdu registers, IP registers and IP to AXI sync registers.
- IPG\_CLK\_S: IPG clock for IP accesses. IP registers are activated by ACLK\_SLOW clock.
- ACLK\_EXSC: Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be used with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

## 21.4 Chip Select Memory Map

The EIM memory space is mapped into 128 MB total memory space in the processor memory. For addresses, see the System memory map table and the CM4 memory map table. The total 128 MB of memory can be divided among the EIM four chip selects. The memory configuration across the chip selects is controlled by the IOMUXC\_GPR1 register. The ADDRSn[10] fields control how much memory is allotted to each chip select.

The following four configurations are supported:

- CS0 (128 MB), CS1 (0 MB), CS2 (0 MB), CS3 (0 MB) [default configuration]
- CS0 (64 MB), CS1 (64 MB), CS2 (0 MB), CS3 (0 MB)
- CS0 (64 MB), CS1 (32 MB), CS2 (32 MB), CS3 (0 MB)
- CS0 (32 MB), CS1 (32 MB), CS2 (32 MB), CS3 (32 MB)

## 21.5 Functional Description

This section provides the functional description for the EIM.

### 21.5.1 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA\_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA\_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

#### NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

#### 21.5.1.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

##### 21.5.1.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write

- Sync access
- All special accesses (Arm platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

### 21.5.1.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

## 21.5.2 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

**Table 21-4. EIM Operation Modes Field Settings**

Control bit fields			Brief mode description
MUM	SRD	SWR	
0	0	0	Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed
		1	Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed
	1	0	Asynchronous write/Synchronous read none multiplexed
		1	Synchronous write/read none multiplexed
	0	0	Asynchronous write/read multiplexed
		1	Synchronous write/ Asynchronous read multiplexed
1	1	0	Asynchronous write/Synchronous read multiplexed
		1	Synchronous write/read multiplexed

### 21.5.3 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts  $\overline{\text{ADV}}$ , causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

#### NOTE

The BCLK signal toggles only when burst access is executed toward the external device ( $\text{BCM}=1'b0$  for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)
- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

### 21.5.4 Burst Clock Divisor (BCD)

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected;  $\overline{\text{ADV}}$  and BCLK. The  $\overline{\text{ADV}}$  signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

## 21.5.5 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=1](#) and [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=0](#) for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

## 21.5.6 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

## 21.5.7 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional  $\overline{ADV}$  signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating  $\overline{ADV}$  signal.

## 21.5.8 AXI (Master) Bus Cycles Support

The EIM uses an Arm AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

**NOTE**

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.
- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case Arm cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See [Table 21-6](#).

**Table 21-5. AXI Burst Cycles Supported**

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	1	INCR	Single transfer
1	2	INCR	Single transfer
1	4	INCR	Single transfer
2	4	WRAP	2-beat wrapping burst
4	4	WRAP	4-beat wrapping burst
8	4	WRAP	8-beat wrapping burst
16	4	WRAP	16-beat wrapping burst
2	4	INCR	2-beat incrementing burst
3	4	INCR	3-beat incrementing burst
4	4	INCR	4-beat incrementing burst
5	4	INCR	5-beat incrementing burst
6	4	INCR	6-beat incrementing burst
7	4	INCR	7-beat incrementing burst
8	4	INCR	8-beat incrementing burst
9	4	INCR	9-beat incrementing burst
10	4	INCR	10-beat incrementing burst
11	4	INCR	11-beat incrementing burst
12	4	INCR	12-beat incrementing burst
13	4	INCR	13-beat incrementing burst
14	4	INCR	14-beat incrementing burst

*Table continues on the next page...*

**Table 21-5. AXI Burst Cycles Supported (continued)**

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
15	4	INCR	15-beat incrementing burst
16	4	INCR	16-beat incrementing burst

**Table 21-6. AXI to Memory Burst Splits Number**

AXI Burst Type	Memory Burst Type Config.	# of accesses to X8	# of accesses to X16	# of accesses to X32
		Memory Port size	Memory Port size	Memory Port size

	WRAP16	2 or 3	2	1 or 2
WRAP8 Aligned Addr.	WRAP16	2	1	1
	Cont.	1	1	1
WRAP8 Unaligned Addr.	WRAP16	2 or 3	1	2
	Cont.	2	2	2

## 21.5.9 WAIT\_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write

access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

### 21.5.10 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

### 21.5.11 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

### 21.5.12 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the wdog\_limit (according to the WDOG\_LIMIT bit field in the WCR) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In dtack access, WDOG-1 counts ACLK cycles instead of BCLK and it reaches the wdog\_limit before the device asserts the dtack signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can be disabled by WDOG\_EN bit in the WCR.

## 21.5.13 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
  - Access to a disabled chip select - access to a mapped chip select address space where the CSEN bit in the corresponding chip select Configuration Register is clear
  - Access to a non mapped address - access to an address that is not mapped to any CS.
  - User access to a supervisor-protected chip select address space (the SP bit in the corresponding chip select Configuration Register is set)
  - User access in fixed mode access
  - User performs write access to write protected chip select
  - First write data ID and write address ID do not match. (No data is written to the memory.)
  - First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
  - Access duration to external device from CSx signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled be software.
- IPS errors
  - User read or write access to a reserved/non-valid address in the EIM Configuration Register

## 21.5.14 DTACK Mode

In DTACK mode, the EIM uses DTACK signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see [Figure 21-15](#), [Figure 21-16](#) & [Figure 21-17](#)).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see [Figure 21-19](#)).

## 21.5.15 EIM\_GRANT / EIM\_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM\_BUSY signal (1'b1) and checks the EIM\_GRANT signal status.

If EIM\_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM\_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM\_BUSY signal set until it completes the access toward the external device.

Once EIM\_GRANT signal is set, it can not be reset until EIM\_BUSY signal is cleared by EIM.

### NOTE

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM\_GRANT signal from NFC and doesn't assert the EIM\_BUSY signal.

## 21.5.16 LPMD / LPACK Handshake Description

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

## 21.5.17 Endianness

Big and Little endianness are supported by the controller according to the following table.

**Table 21-7. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0**

Endian mode	AXI access	AXI address [1:0]	Port size and used bits								
			Word port				Half word port				Byte port
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])
Big	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB3	0xB2	0	0xB3
							1	0xB1	0xB0	1	0xB2
										2	0xB1
										3	0xB0
	Half Word	0			0xB1	0xB0	0	0xB3	0xB2	0	0xB3
							1	0xB1	0xB0	1	0xB2
		2	0xB3	0xB2						2	0xB1
										3	0xB0
	Byte	0				0xB0	0		0xB3	0	0xB3
					0xB1			0xB2		1	0xB2
		1		0xB2			1		0xB1	2	0xB1
			0xB3						0xB0	3	0xB0
Little	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB1	0xB0	0	0xB0
							1	0xB3	0xB2	1	0xB1
					0xB1	0xB0				2	0xB2
										3	0xB3
	Half Word	0			0xB1	0xB0	0	0xB1	0xB0	0	0xB0
							1	0xB3	0xB2	1	0xB1
		2	0xB3	0xB2						2	0xB2
										3	0xB3
	Byte	0				0xB0	0		0xB0	0	0xB0
					0xB1			0xB1		1	0xB1
		1		0xB2			1		0xB2	2	0xB2
			0xB3						0xB3	3	0xB3

## 21.5.18 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

**NOTE**

Strobe signal for read data is active ( $RL + 1$ ) cycles after data on external bus is valid.

## 21.6 Initialization Information

### 21.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM\_BOOT [2:0] block inputs.

## 21.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR\_I(address, data, delta, counter) is a write data sequence, there  $data(i+1) = data(i) + \text{delta}$
- COMMAND\_SEQUENCE
- CHECK\_STATUS

**NOTE**

COMMAND\_SEQUENCE and CHECK\_STATUS are described in [AMD Flash Utility](#), [Intel Sibley Flash Utility](#), [MDOC Device Utility](#), [Samsung OneNAND Utility](#), and [Spansion Flash Utility](#).

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM\_" is a prefix of EIM's registers. 'h is a prefix of hexadecimal constant. "//" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

## Typical Application

Configuration examples were verified with the memory models listed below and may require some adjustments for other family members.

### 21.7.1 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

#### 21.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM\_CS0GCR1,'h00210081);
- WR32('EIM\_CS0RCR1,'h0e020000);
- WR32('EIM\_CS0RCR2,'h00000000);
- WR32('EIM\_CS0WCR1,'h0704a040);

#### 21.7.1.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```
// Set memory to synchronous read mode
    WR16 ('CS0+('h5903<<1), 'h0060);
    WR16 ('CS0+('h5903<<1), 'h0003);
    WR16 ('CS0+('h0000<<1), 'h00ff);
// Set EIM configuration to synchronous timing
    WR32 ('EIM_CS0GCR1, 'h50214225);           // 133 MHz
    WR32 ('EIM_CS0RCR1, 'h0c000000);           // 12 cycles on memory
```

Configuration used for 66 MHz synchronous access to muxed flash:

```
// Set memory to synchronous read mode
    WR16 ('CS0+('h3103<<1), 'h0060);
    WR16 ('CS0+('h3103<<1), 'h0003);
    WR16 ('CS0+('h0000<<1), 'h00ff);
//-----
// Set EIM configuration to synchronous timing
    WR32 ('EIM_CS0GCR1, 'h5021122d);           // 66 MHz
    WR32 ('EIM_CS0RCR1, 'h07000000);           // 7cycles on memory
```

#### 21.7.1.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
    WR16 ('CS0+addr, 'h0060);                  // Unlock
    WR16 ('CS0+addr, 'h00d0);
    WR16 ('CS0+addr, 'h0041);
    WR16 ('CS0+addr, data);
    WR16 ('CS0+caddr, 'h0070);                  // Read Status command
    while('CS0+data[7] == 0)                     // Wait / Polling
        RD16 ('CS0+addr, data);                 // Read status
        RD16 ('CS0+addr, data);                 // Read status
```

```

WR16('CS0+'h0000, 'h00ff);
// Write buffer programming
WR16('CS0+addr, 'h0060); // Unlock
WR16('CS0+addr, 'h00d0);
data = 0;
WR16('CS0+addr, 'h0070); // Read Status command
while(data[7] == 0) // Wait
    RD16('CS0+addr, data); // Read status
WR16('CS0+'h0000, 'h00ff);
WR16('CS0+addr, 'h00e9); // Write Buffer command
WR16('CS0+addr, 255); // Word counter (<256)
for(i=0; i<'h200; i = i + 'h40)
    WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
WR16('CS0+addr, 'h00d0); // Write Confirm command
data = 0;
while(data[7] == 0) // Wait
    RD16('CS0+addr, data); // Read status
    RD16('CS0+addr, data); // Read status
WR16('CS0+'h0000, 'h00ff);

```

## 21.7.2 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

### 21.7.2.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

### 21.7.2.2 MDOC Device Asynchronous Mode Configuration

```

// Non-muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h12092492);
// Muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h12092492);

```

### 21.7.2.3 MDOC Device Utility

```

// Read Manufacturer ID and Device ID
RE16('CS0+'h9400, 'h4833);
RE16('CS0+'h9422, 'hb7cc);

```

## 21.7.3 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16fb\_706.

### 21.7.3.1 Micron PSRAM Asynchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1,'h403104b1);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0b040040);
// 32 bit memory
WR32('EIM_CS0GCR1,'h403304b1);
WR32('EIM_CS0RCR1,'h0f010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0f040040);
```

### 21.7.3.2 Micron PSRAM Synchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1,'h403104b1);
WR32('EIM_CS0WCR1,'h0b040000);
WR16('CS0+('h85947<<1),'h0040); // memory configuration
WR32('EIM_CS0GCR1,'h4021_5487); // fixed latency memory wrap 4
WR32('EIM_CS0RCR1,'h04000000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h04000000);
// 32 bit memory
WR32('EIM_CS0GCR1,'h6003_04f1);
WR32('EIM_CS0WCR1,'h0b04_0000);
WR32('CS0+('h85947<<2),'h0040); // memory configuration
WR32('EIM_CS0GCR1,'h4003_1487); // var latency memory inc. page size 128
WR32('EIM_CS0RCR1,'h04000000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h04000000);
```

## 21.7.4 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

### 21.7.4.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]
- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

## 21.7.4.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
WR32 ('EIM_CS0GCR1,'h00410081);
WR32 ('EIM_CS0RCR1,'h0b010000);
WR32 ('EIM_CS0RCR2,'h00000000);
WR32 ('EIM_CS0WCR1,'h0c092480);
// Muxed memory
WR32 ('EIM_CS0GCR1,'h00410089);
WR32 ('EIM_CS0RCR1,'h0b010000);
WR32 ('EIM_CS0RCR2,'h00000000);
WR32 ('EIM_CS0WCR1,'h0c092480);
```

## 21.7.4.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
WR16 ('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
WR32 ('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
WR32 ('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
WR16 ('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
WR32 ('EIM_CS0GCR1,'h5041240f); // 44 MHz
WR32 ('EIM_CS0RCR1,'h05010000);
WR32 ('EIM_CS0WCR1,'h05040000);
```

## 21.7.4.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
WR16 ('CS0+('hF100<<1),'h0);           // DFS
WR16 ('CS0+('hF100<<1),'h0);           // DBS
WR16 ('CS0+('hF24c<<1),'h2);          // SBA - block number (2)
WR16 ('CS0+('hF241<<1),'h0);          // Clear interrupt status
WR16 ('CS0+('hF220<<1),'h23);         // Unlock command
data ='h0;
while(!(data &'h0004))                  // Polling
    RD32 ('WIAR, data); // Read status
// Erase block command
WR16 ('CS0+('hF100<<1),'h2);          // DFS and block ([8:0]) address
WR16 ('CS0+('hF101<<1),'h0);           // DBS
WR16 ('CS0+('hF241<<1),'h0);           // Clear interrupt status
```

## Typical Application

```
WR16('CS0+('hF220<<1), 'h94); // Erase command
data ='h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
// Program page command
WR16('CS0+('hF100<<1), 'h2); // DFS and block[8:0] address
WR16('CS0+('hF107<<1), 'h0); // sector[1:0] and page[7:2] addresses
WR16('CS0+('hF200<<1), 'h800); // buffer[11:8] address and counter[1:0]
WR16('CS0+('hF241<<1), 'h0); // Clear interrupt status
WR16('CS0+('hF220<<1), 'h80); // Program command
data ='h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
```

## 21.7.5 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

### 21.7.5.1 Samsung UtRAM Asynchronous Mode Configuration

```
WR32('EIM_CS0GCR1, 'h400104b1);
WR32('EIM_CS0RCR1, 'h0a010000);
WR32('EIM_CS0RCR2, 'h00000008);
WR32('EIM_CS0WCR1, 'h0b040040);
```

### 21.7.5.2 Samsung UtRAM Synchronous Mode Configuration

```
RD16('CS0+('hff_ffff<<1), data); // command sequence
RD16('CS0+('hff_ffff<<1), data);
RD16('CS0+('hff_ffff<<1), data);
RD16('CS0+('hff_feff<<1), data);
RD16('CS0+('h00_82a0<<1), data); // memory sync. configuration
WR32('EIM_CS0GCR1, 'h4021_53b7); // fixed latency memory wrap 32
WR32('EIM_CS0RCR1, 'h0500_0000);
WR32('EIM_CS0WCR1, 'h0300_0000);
```

## 21.7.6 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

### 21.7.6.1 Spansion Flash Asynchronous Mode Configuration

```
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0a018000);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h0704a240);
WR16('CS0+('hF220<<1), 'h94); // Erase command
data ='h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
// Program page command
```

```

WR16('CS0+('hF100<<1), 'h2);           // DFS and block[8:0] address
WR16('CS0+('hF107<<1), 'h0);           // sector[1:0] and page[7:2] addresses
WR16('CS0+('hF200<<1), 'h800);         // buffer[11:8] address and counter[1:0]
WR16('CS0+('hF241<<1), 'h0);           // Clear interrupt status
WR16('CS0+('hF220<<1), 'h80);           // Program command
data ='h0;
while(!(data & 'h0004))                  // Wait
    RD32('WIAR, data); // Read status

```

## 21.7.6.2 Spansion Flash Synchronous Mode Configuration

```

WR16('CS0+('h0555<<1), 'h00aa);      // command sequence
WR16('CS0+('h02aa<<1), 'h0055);
WR16('CS0+('h0555<<1), 'hd0);
WR16('CS0+('h0000<<1), 'h1ec4);      // memory sync. configuration
WR32('EIM_CS0GCR1, 'h50411325); // 66 MHz
WR32('EIM_CS0RCR1, 'h05000000); // 5 cycles on memory

```

## 21.7.6.3 Spansion Flash Utility

```

// Single word programming
COMMAND_SEQUENCE(cs,16,'ha0);           // single word programming
WR16('CS0+addr, data);
CHECK_STATUS('CS0+addr,data,16,1,errst);
// Write buffer programming
COMMAND_SEQUENCE(0,16,'h25);             // write buffer programming
WR16('CS0+addr,'h001f);                 // counter-1
WR_I('CS0+addr, data, 'h0010_0001, 16); // data
WR16('CS0+addr,'h0029);                 // write buffer to flash
CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);

```

There COMMAND\_SEQUENCE and CHECK\_STATUS are next functions:

```

task COMMAND_SEQUENCE;
    input [2:0]      cs;
    input [7:0]      port_size;
    input [31:0]     code;
begin
    if(port_size == 16)
        begin
            WR16(csba[cs]+('h0555<<1), 'h00aa);
            WR16(csba[cs]+('h02aa<<1), 'h0055);
            WR16(csba[cs]+('h0555<<1), code);
        end
    else
        begin
            WR32(csba[cs]+('h0555<<2), 'h00aa);
            WR32(csba[cs]+('h02aa<<2), 'h0055);
            WR32(csba[cs]+('h0555<<2), code);
        end
end
endtask
task      CHECK_STATUS;
    input [31:0]   addr;
    input [31:0]   edata;
    input [7:0]    port_size;
    input [7:0]    opcode;
    output[7:0]    errst;
    reg[31:0]     data;
    reg[31:0]     data3;
begin
    errst = 0;

```

## Typical Application

```
data = 0;
data3 = 0;
while(!(data == edata) && !errst) // Wait operation
begin: BR_EN
    RD16(addr, data);           // Read status
    if(data[7] != edata[7])
        begin
            if(data[5] == 1)
                begin
                    RD16(addr, data3);
                    RD16(addr, data);
                    if(data[6] != data3[6])
                        begin
                            $display("CHECK_STATUS: Error timeout on single data program");
                            errst = 1;
                            disable BR_EN;
                        end
                    end
                end
            else
                begin
                    if(opcode == 2)
                        if(data[1] == 1)
                            begin
                                RD16(addr, data3);
                                if(port_size == 32)
                                    RD32(addr, data);
                                else
                                    RD16(addr, data);
                                if(data[1] == 1 && data != edata)
                                    begin
                                        $display("CHECK_STATUS: Error on write buffer");
                                        errst = 3;
                                        disable BR_EN;
                                    end
                            end
                        end
                end
            end
        end
    else
        begin
            RD16(addr, data3);
            if(port_size == 32)
                RD32(addr, data);
            else
                begin
                    RD16(addr, data);
                    edata[31:16] = 16'h0;
                end
            if(data != edata)
                begin
                    $display("CHECK_STATUS: Error in data write on single data program");
                    errst = 2;
                    disable BR_EN;
                end
        end
    end
end
endtask
```

## 21.7.7 8 bit support

This section details the pin connections for Intel mode and Motorola mode.

Intel Mode - For intel mode use the following connection:

**Table 21-8. Intel Mode pin connections**

Arm platform Pin	EIM Pin	Notes
ADS#	IPP_DO_ADV_B	WAL = 1, RAL = 1
W/R	IPP_DO_BE_B	WBED = 1
WR#	WE#	
RD#	OE#	

Mot. Mode - For intel mode use the following connection:

**Table 21-9. Motorola Mode pin connections**

Arm platform Pin	EIM Pin	Notes
AS#	IPP_DO_CS_B	
R/W#	WE#	
LDS#	BE#	

## 21.8 External Bus Timing Diagrams

The following timing diagrams show the timing of accesses to memory or a peripheral with different timing parameters. All examples done for CS0, but are valid for any others chip select. BE means one from current used BE[3:0].

## 21.8.1 Asynchronous Read Memory Accesses Timing Diagram

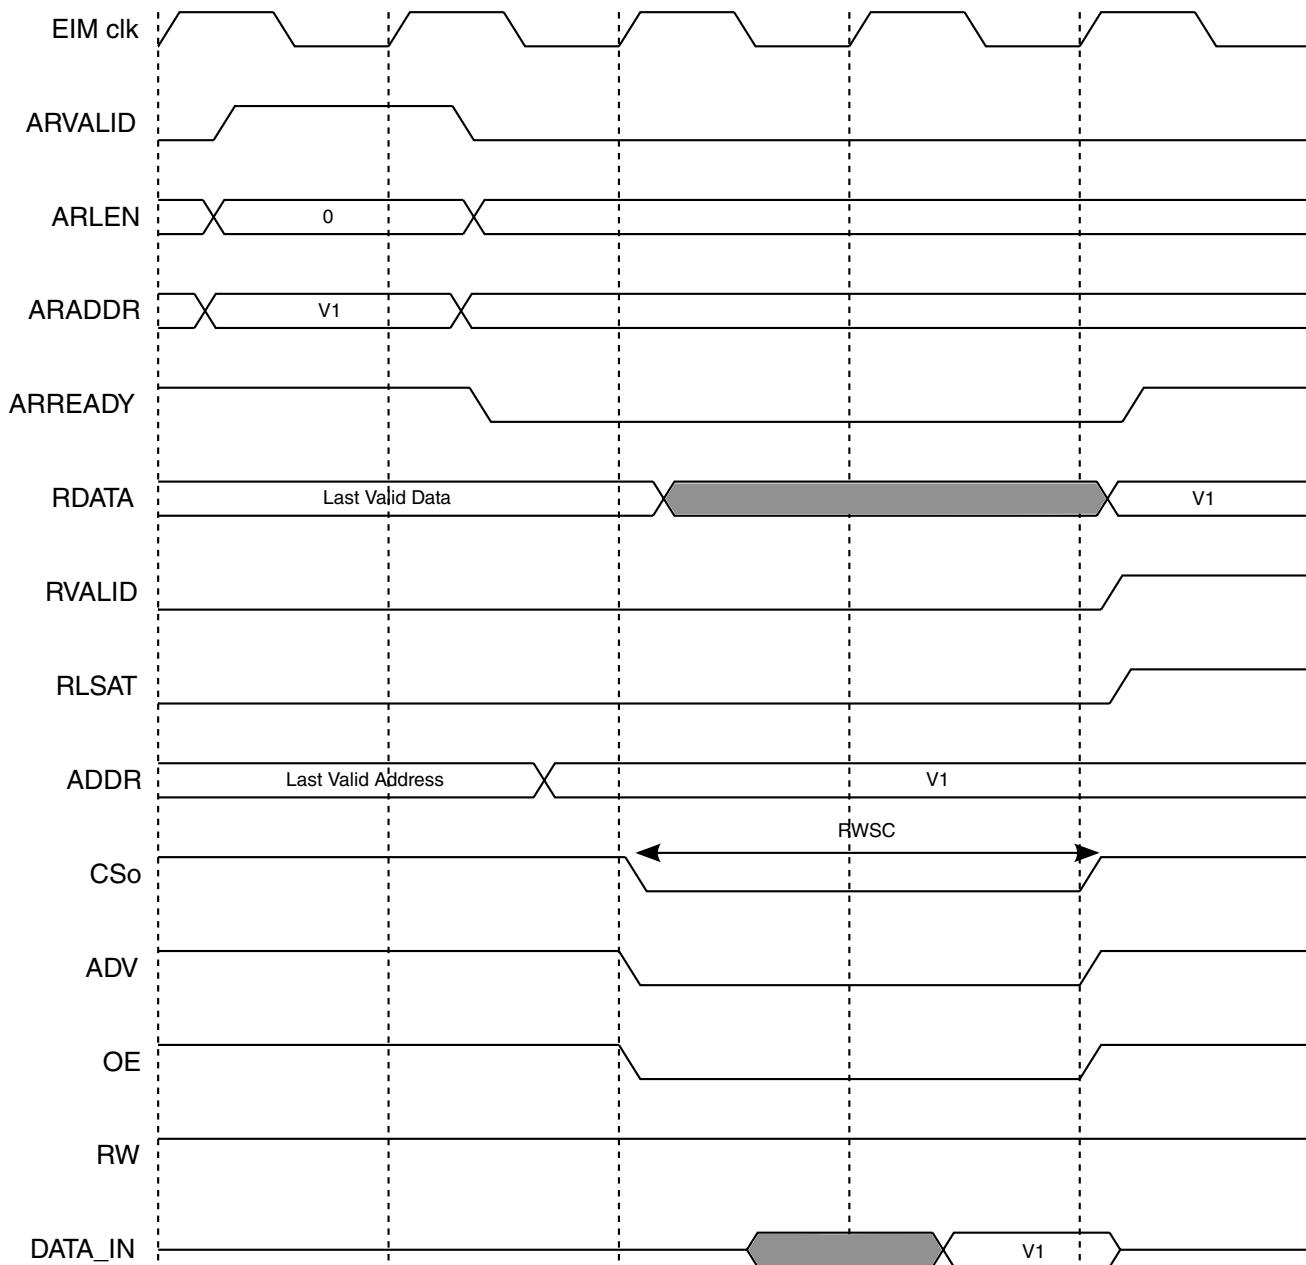

Figure 21-2. Read Access, RWSC=2,RCSA=0,OEA=0,RCSN=0,OEN=0, RAL=1

## 21.8.2 Asynchronous Write Memory Accesses Timing Diagram

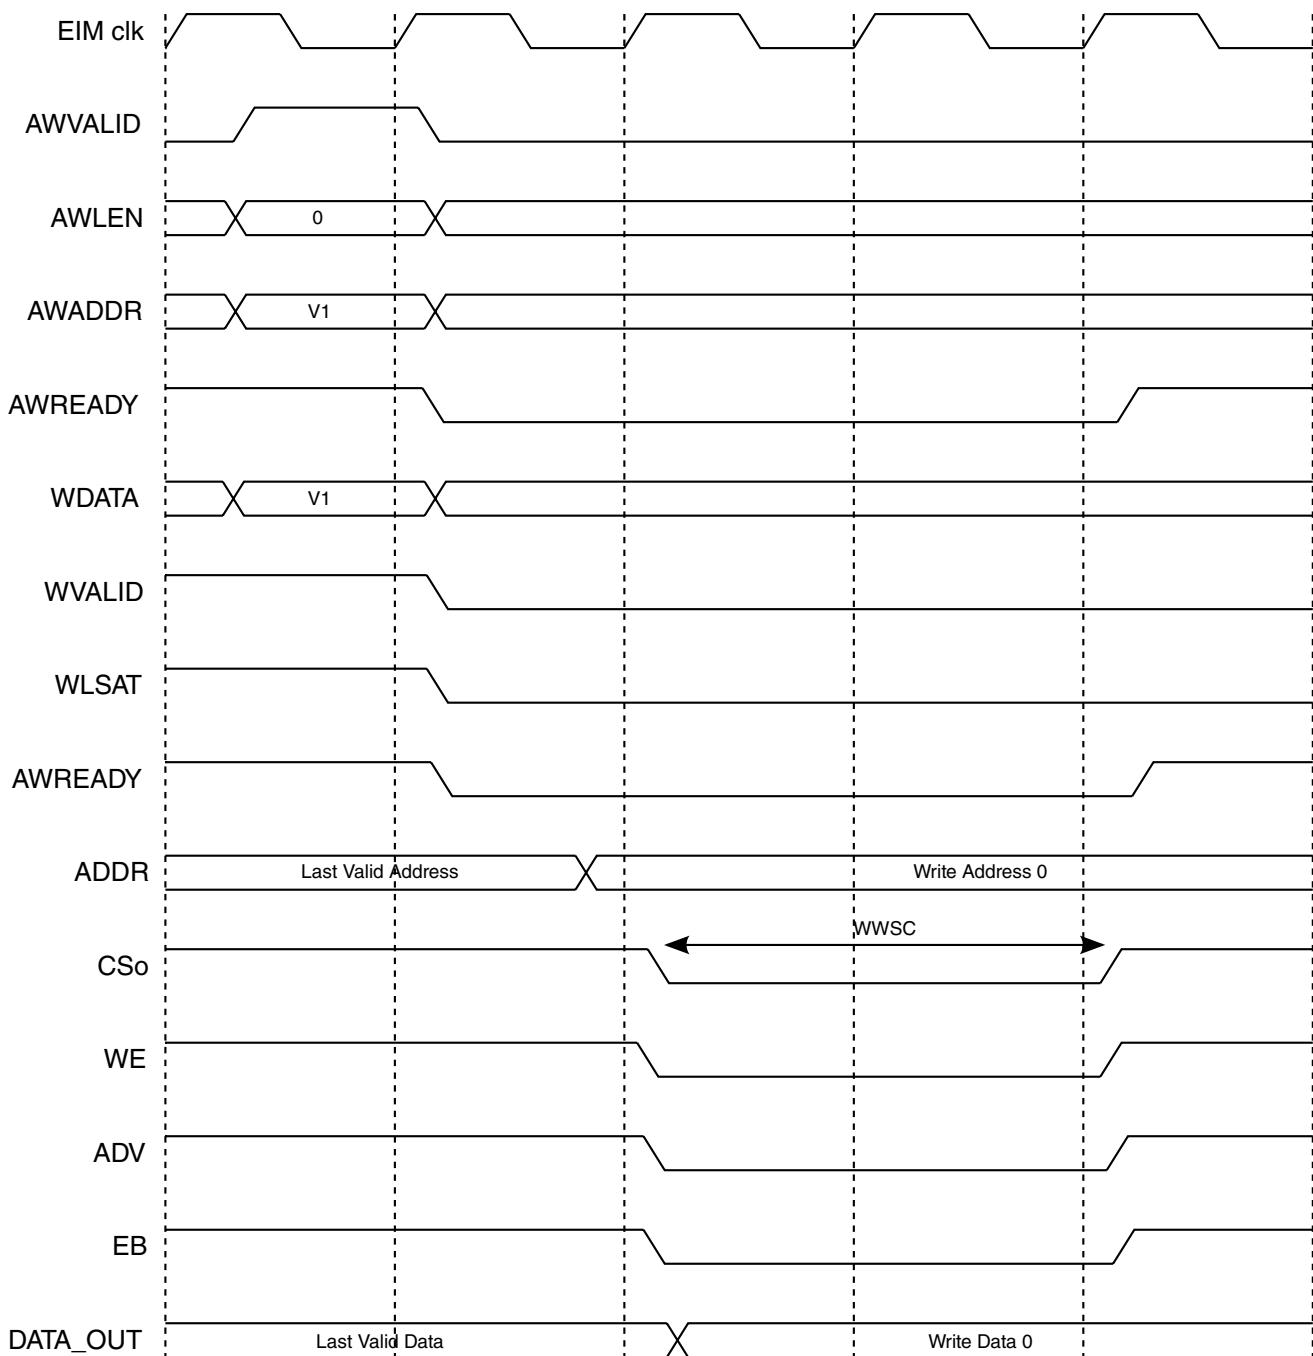

Figure 21-3. Write Access, WWSC=2,WCSA=0,WEA=0,WCSN=0,WEN=0,BEA=0, BEN=0, WAL=1

## 21.8.3 Asynchronous Read/Write Memory Accesses Timing Diagram

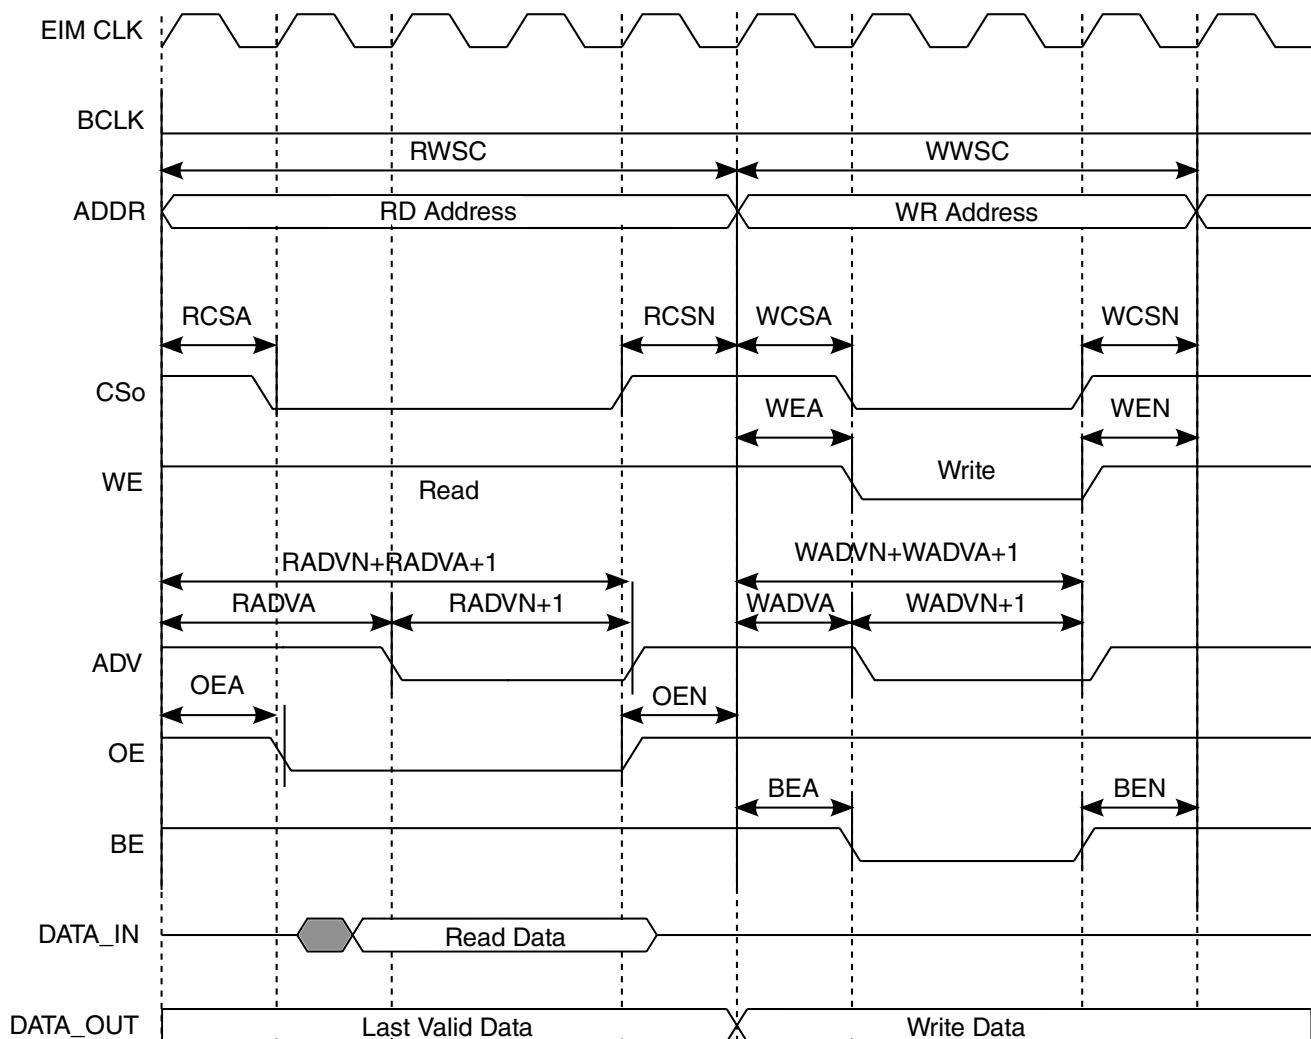

Figure 21-4.

## 21.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM\_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM\_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM\_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM\_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM\_CSnRCR2)
- Chip Select n Write Configuration Register (EIM\_CSnWCR)

In addition there are 3 general registers: EIM\_WCR, EIM\_WIAR, and EIM\_EAR.

### NOTE

- All EIM registers are sampled by IPG\_CLK\_S, therefore IPG\_CLK\_S must be active when accessing through IP bus.
- Read access from all registers (except EIM\_WIAR and EIM\_EAR) will generate one IPG\_XFR\_WAIT cycle.
- Read access from EIM\_WIAR and EIM\_EAR will generate six IPG\_XFR\_WAIT cycles.
- Write access to all registers (except EIM\_EAR) will generate three IPG\_XFR\_WAIT cycles.
- Write access to EIM\_EAR will generate six IPG\_XFR\_WAIT cycles.

### EIM\_CSnGCR1 field descriptions

Field	Description
31–28 PSZ	Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately.

*Table continues on the next page...*

**EIM\_CSnGCR1 field descriptions (continued)**

Field	Description
	<p>It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset.</p> <p>0000 8 words page size      0001 16 words page size      0010 32 words page size      0011 64 words page size      0100 128 words page size      0101 256 words page size      0110 512 words page size      0111 1024 (1k) words page size      1000 2048 (2k) words page size      1001 - 1111 Reserved</p>
27 WP	<p>Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset.</p> <p>0 Writes are allowed in the memory range defined by chip.      1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.</p>
26–24 GBC	<p>Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only)      001 minimum of 1 EIM clock cycles before next access from different chip select      010 minimum of 2 EIM clock cycles before next access from different chip select      111 minimum of 7 EIM clock cycles before next access from different chip select</p>
23 AUS	<p>Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset.</p> <p>0 Address shifted according to port size (DSZ config) (128 Mbyte maximum supported memory density).      1 Address unshifted (32 Mbyte maximum supported memory density).</p>
22–20 CSREC	<p>CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only)      001 1 EIM clock cycles minimum width of CS, OE and WE signals      010 2 EIM clock cycles minimum width of CS, OE and WE signals      111 7 EIM clock cycles minimum width of CS, OE and WE signals</p>
19 SP	Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset.

*Table continues on the next page...*

**EIM\_CS<sub>n</sub>GCR1 field descriptions (continued)**

Field	Description
	<p>0 User mode accesses are allowed in the memory range defined by chip select.      1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.</p>
18–16 DSZ	<p>Data Port Size. This bit field defines the width of an external device's data port as shown below.</p> <p><b>NOTE:</b> Only async. access supported for 8 bit port.</p> <p><b>NOTE:</b> The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001.</p> <ul style="list-style-type: none"> <li>000 Reserved.</li> <li>001 16 bit port resides on DATA[15:0]</li> <li>010 16 bit port resides on DATA[31:16]</li> <li>011 32 bit port resides on DATA[31:0]</li> <li>100 8 bit port resides on DATA[7:0]</li> <li>101 8 bit port resides on DATA[15:8]</li> <li>110 8 bit port resides on DATA[23:16]</li> <li>111 8 bit port resides on DATA[31:24]</li> </ul>
15–14 BCS	<p>Burst Clock Start. When SRD=1 or SWR=1, this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated.</p> <p>When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset.</p> <ul style="list-style-type: none"> <li>00 0 EIM clock cycle additional delay</li> <li>01 1 EIM clock cycle additional delay</li> <li>10 2 EIM clock cycle additional delay</li> <li>11 3 EIM clock cycle additional delay</li> </ul>
13–12 BCD	<p>Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset.</p> <p><b>NOTE:</b> For other then the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly.</p> <ul style="list-style-type: none"> <li>00 Divide EIM clock by 1</li> <li>01 Divide EIM clock by 2</li> <li>10 Divide EIM clock by 3</li> <li>11 Divide EIM clock by 4</li> </ul>
11 WC	<p>Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset.</p> <ul style="list-style-type: none"> <li>0 Write access burst length occurs according to BL value.</li> <li>1 Write access burst length is continuous.</li> </ul>
10–8 BL	<p>Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size, type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access.</p> <p>BL is cleared by a hardware reset.</p>

Table continues on the next page...

**EIM\_CS<sub>n</sub>GCR1 field descriptions (continued)**

Field	Description
	<p>When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1.</p> <p>000 4 words Memory wrap burst length (read page burst size when APR = 1)      001 8 words Memory wrap burst length (read page burst size when APR = 1)      010 16 words Memory wrap burst length (read page burst size when APR = 1)      011 32 words Memory wrap burst length (read page burst size when APR = 1)      100 Continuous burst length (2 words read page burst size when APR = 1)      101 Reserved      110 Reserved      111 Reserved</p>
7 CREP	<p>Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset.</p> <p><b>NOTE:</b> Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled.</p> <p>For Non-PSRAM memory CREP value should be 1.</p> <p>0 CRE signal is active low      1 CRE signal is active high</p>
6 CRE	<p>Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset.</p> <p>0 CRE signal use is disable      1 CRE signal use is enable</p>
5 RFL	<p>Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset.</p> <p>When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device.</p> <p>0 the External device WAIT signal is being monitored, and it reflect the external data bus state      1 the state of the External devices is determined internally (Fix latency mode only)</p>
4 WFL	<p>Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset.</p> <p>When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device</p> <p>0 the External device WAIT signal is being monitored, and it reflect the external data bus state      1 the state of the External devices is determined internally (Fix latency mode only)</p>
3 MUM	<p>Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent).</p> <p><b>NOTE:</b> The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0.</p> <p>0 Multiplexed Mode disable      1 Multiplexed Mode enable</p>

Table continues on the next page...

**EIM\_CS*n*GCR1 field descriptions (continued)**

Field	Description
2 SRD	Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset.  <b>NOTE:</b> Sync. accesses supported only for 16/32 bit port.  0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode
1 SWR	Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset.  <b>NOTE:</b> Sync. accesses supported only for 16/32 bit port.  0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode
0 CSEN	CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5.  <b>NOTE:</b> Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0.  0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access.

## 21.9.2 Chip Select *n* General Configuration Register 2 (EIM\_CS*n*GCR2)

Address: 21B\_8000h base + 4h offset + (24d × i), where i=0d to 5d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**EIM\_CSnGCR2 field descriptions**

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 MUX16_BYP_ GRANT	Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses). 0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9 DAP	Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset. 0 DTACK signal is active high 1 DTACK signal is active low
8 DAE	Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset. 0 DTACK signal use is disable 1 DTACK signal use is enable
7–4 DAPS	Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses. <b>NOTE:</b> Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access. DAPS is cleared by a hardware reset. Example settings: 0000 3 EIM clk cycle between start of access and first DTACK check 0001 4 EIM clk cycles between start of access and first DTACK check 0010 5 EIM clk cycles between start of access and first DTACK check 0111 10 EIM clk cycles between start of access and first DTACK check 1011 14 EIM clk cycles between start of access and first DTACK check 1111 18 EIM clk cycles between start of access and first DTACK check
3–2 Reserved	This read-only field is reserved and always has the value 0.
ADH	Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode). When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched. <b>NOTE:</b> Reset value for EIM_CS0GCR2 for ADH is 10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 00. 00 0 cycle after ADV negation 01 1 cycle after ADV negation 10 2 cycle after ADV negation 11 Reserved

### 21.9.3 Chip Select n Read Configuration Register 1 (EIM\_CS*n*RCR1)

#### EIM\_CS*n*RCR1 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29–24 RWSC	<p>Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select.</p> <p>When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>RWSC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RCR1, RWSC[5:0] = 0b011100. For CG1RCR1 - CS1RCR5 the reset value is 0b000000.</p> <p>Example settings:</p> <ul style="list-style-type: none"> <li>000000 Reserved</li> <li>000001 RWSC value is 1</li> <li>000010 RWSC value is 2</li> <li>111101 RWSC value is 61</li> <li>111110 RWSC value is 62</li> <li>111111 RWSC value is 63</li> </ul>
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 RADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <ul style="list-style-type: none"> <li>000 0 EIM clock cycles between beginning of access and ADV assertion</li> </ul>

Table continues on the next page...

**EIM\_CSnRCR1 field descriptions (continued)**

Field	Description
	<p>001 1 EIM clock cycles between beginning of access and ADV assertion      010 2 EIM clock cycles between beginning of access and ADV assertion      111 7 EIM clock cycles between beginning of access and ADV assertion</p>
19 RAL	Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration.
18–16 RADVN	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses. When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access.</p> <p>When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset.</p> <p><b>NOTE:</b> the reset value for EIM_CS0RCR1[RADVN] = 2. For EIM_CS1RCR1 - EIM_CS5RCR1, the reset value is 0b000.</p> <p><b>NOTE:</b> This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.</p>
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 OEA	<p>OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset.</p> <p>In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH +1) EIM clock cycles from start of access.</p> <p><b>NOTE:</b> The reset value for EIM_CS0RCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RCR1 is 0b010. The reset value of this field for EIM_CS1RCR1 - EIM_CS5RCR1 is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and OE assertion      001 1 EIM clock cycles between beginning of access and OE assertion      010 2 EIM clock cycles between beginning of access and OE assertion      111 7 EIM clock cycles between beginning of access and OE assertion</p>
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 OEN	OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 and APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset.
	<p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and OE negation      001 1 EIM clock cycles between end of access and OE negation      010 2 EIM clock cycles between end of access and OE negation      111 7 EIM clock cycles between end of access and OE negation</p>
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RCSA	Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset.

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 APR	<p>Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored.</p> <p>APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1.</p> <p><b>NOTE:</b> SRD=0 and MUM=0 must apply when APR=1</p>

Table continues on the next page...

**EIM\_CSnRCR2 field descriptions (continued)**

Field	Description
14–12 PAT	<p>Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored.</p> <p>PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1.</p> <ul style="list-style-type: none"> <li>000 Address width is 2 EIM clock cycles</li> <li>001 Address width is 3 EIM clock cycles</li> <li>010 Address width is 4 EIM clock cycles</li> <li>011 Address width is 5 EIM clock cycles</li> <li>100 Address width is 6 EIM clock cycles</li> <li>101 Address width is 7 EIM clock cycles</li> <li>110 Address width is 8 EIM clock cycles</li> <li>111 Address width is 9 EIM clock cycles</li> </ul>
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 RL	<p>Read Latency. This bit field indicates cycle latency when executing a synchronous read operation.</p> <p>The fields holds the feedback clock loop delay in ackl cycle units.</p> <p>This field is cleared by a hardware reset.</p> <ul style="list-style-type: none"> <li>00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0</li> <li>01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0</li> <li>10 Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0</li> <li>11 Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0</li> </ul>
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RBEA	<p>Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset.</p> <p>Example settings:</p> <ul style="list-style-type: none"> <li>000 0 EIM clock cycles between beginning of read access and BE assertion</li> <li>001 1 EIM clock cycles between beginning of read access and BE assertion</li> <li>010 2 EIM clock cycles between beginning of read access and BE assertion</li> <li>111 7 EIM clock cycles between beginning of read access and BE assertion</li> </ul>
3 RBE	<p>Read BE enable. This bit field determines if BE will be asserted during read access.</p> <ul style="list-style-type: none"> <li>0 - BE are disabled during read access.</li> <li>1- BE are enable during read access according to value of RBEA and RBEN bit fields.</li> </ul>
RBEN	<p>Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 and APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset.</p> <p>Example settings:</p> <ul style="list-style-type: none"> <li>000 0 EIM clock cycles between end of read access and BE negation</li> <li>001 1 EIM clock cycles between end of read access and BE negation</li> <li>010 2 EIM clock cycles between end of read access and BE negation</li> <li>111 7 EIM clock cycles between end of read access and BE negation</li> </ul>

## 21.9.5 Chip Select n Write Configuration Register 1 (EIM\_CS*n*WCR1)

### EIM\_CS*n*WCR1 field descriptions

Field	Description
31 WAL	Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADVN bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADVN bit field configuration.
30 WBED	Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses. This bit is cleared by hardware reset.
29–24 WWSC	<p>Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select.</p> <p>When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>WWSC is cleared by a hardware reset.</p> <p><b>NOTE:</b> The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000.</p> <p>Example settings:</p> <ul style="list-style-type: none"> <li>000000 Reserved</li> <li>000001 WWSC value is 1</li> <li>000010 WWSC value is 2</li> <li>000011 WWSC value is 3</li> <li>111111 WWSC value is 63</li> </ul>

### EIM\_WCR field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
11 FRUN_ACLK_EN	Free run ACLK enable
10–9 WDOG_LIMIT	Memory Watchdog (WDOG) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtack mode) before the WDOG counter terminates the access and send an error response to the master.  00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles
8 WDOG_EN	Memory WDOG enable. This bit controls the operation of the wdog counter that terminates the EIM access.  0 Memory WDOG is Disabled 1 Memory WDOG is Enabled

Table continues on the next page...

**EIM\_WCR field descriptions (continued)**

Field	Description
7–6 Reserved	This read-only field is reserved and always has the value 0.
5 INTPOL	Interrupt Polarity. This bit field determines the polarity of the external device interrupt. 0 External interrupt polarity is active low 1 External interrupt polarity is active high
4 INTEN	Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and the EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset. 0 External interrupt Disable 1 External interrupt Enable
3 CONT_BCLK_SEL	Continuous BCLK select When this bit is set BCLK pin output continuous clock. Otherwise, BCLK will output clock only when necessary. 0 BCLK When necessary 1 BCLK Continuous
2–1 GBCD	General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GBCD bit field has no influence. GBCD is cleared by a hardware reset. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
0 BCM	Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset. <b>NOTE:</b> The BCLK frequency in this mode is according to GBCD bit field. <b>NOTE:</b> The BCLK phase is opposite to the EIM clock in this mode if GBCD is 0. <b>NOTE:</b> This bit should be used only in async. accesses. No sync access can be executed if this bit is set. <b>NOTE:</b> When this bit is set bcd field shouldn't be configured to 0. 0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration)

# **Chapter 22**

## **10/100-Mbps Ethernet MAC (ENET)**

### **22.1 Introduction**

The MAC-NET core, in conjunction with a 10/100-Mbit/s MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

### **22.2 Overview**

The core implements a dual-speed 10/100-Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

## 22.2.1 Features

The MAC-NET core includes the following features.

### 22.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
  - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
  - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
  - Pause quanta used to form pause frames — dynamically programmable
  - Pause frame generation additionally controllable by user application offering flexible traffic flow control
  - Optional forwarding of received pause frames to the user application
  - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)

- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors
- Interrupt coalescing reduces the number of interrupts generated by the MAC, reducing CPU loading

### **22.2.1.2 IP protocol performance optimization features**

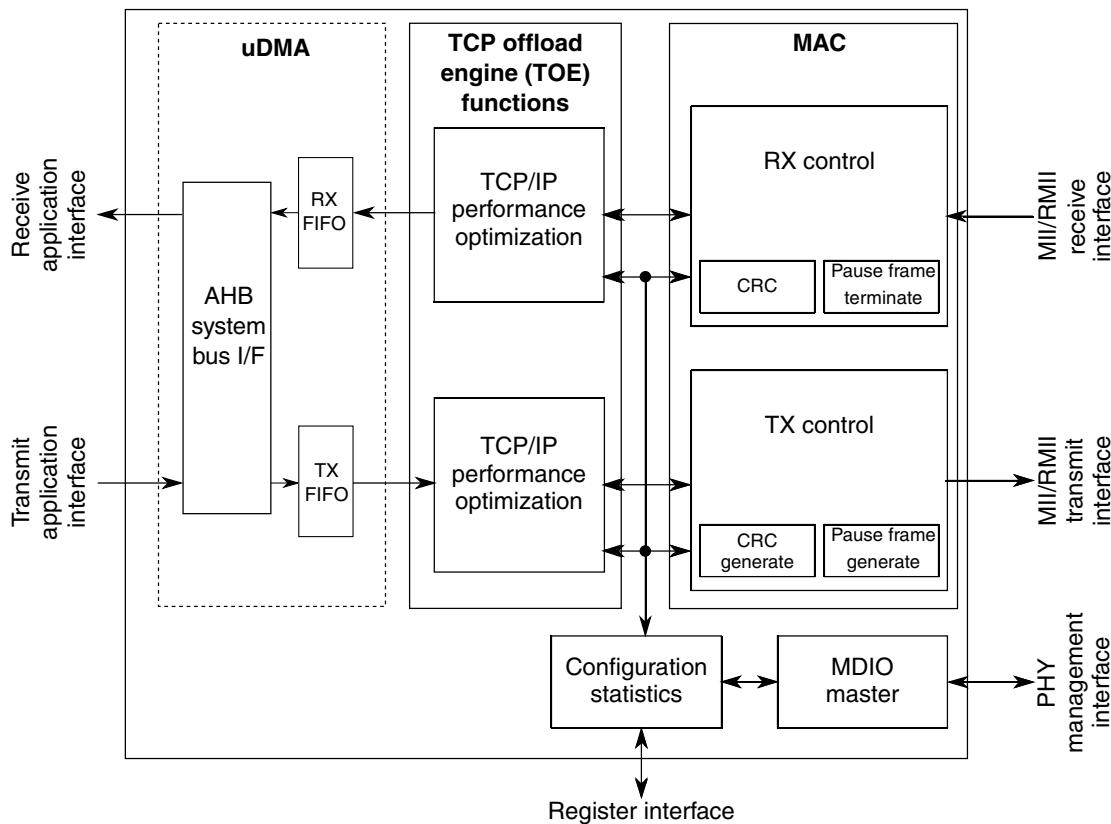

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers

- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodified/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

### **22.2.1.3 IEEE 1588 features**

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

## 22.2.2 Block diagram

**Figure 22-1. Ethernet MAC-NET core block diagram**

## 22.3 External Signals

The table found here describes the external signals of ENET.

**Table 22-1. ENET1 External Signals**

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET1_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in	MII / RMII / RGMII	SD3_DATA7	ALT6	IO

	detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET1_COL	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for fullduplex mode.	MII	ENET1_COL	ALT0	IO
ENET1_CRS	Carrier sense. When asserted, indicates transmit or receive medium is not idle. In RMII mode, this signal is present on the ENET_RX_EN pin.	MII	ENET1_CRS	ALT0	IO
ENET1_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	MII / RMII	ENET1_MDC	ALT0	IO
			ENET2_COL	ALT1	
			GPIO1_IO04	ALT2	
ENET1_MDIO	Transfers control information between the external PHY and the mediaaccess controller. Data is synchronous to MDC. This signal is an input after reset.	MII / RMII	ENET1_MDIO	ALT0	IO
			ENET2_CRS	ALT1	
			GPIO1_IO05	ALT2	
ENET1_REF_CLK1	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	RMII	ENET1_TX_CLK	ALT1	IO
			GPIO1_IO05	ALT4	
ENET1_REF_CLK_25_M	25 MHz Reference Clock	-	ENET1_RX_CLK	ALT1	IO
			GPIO1_IO03	ALT2	
ENET1_RGMII_RXC	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	RGMII	RGMII1_RXC	ALT0	IO
ENET1_RGMII_TXC	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII1_TXC	ALT0	IO
ENET1_RX_CLK	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	MII	ENET1_RX_CLK	ALT0	IO

*Table continues on the next page...*

**Table 22-1. ENET1 External Signals (continued)**

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET1_RX_DATA0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RMII / RGMII	RGMII1_RD0	ALT0	IO
ENET1_RX_DATA1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RMII / RGMII	RGMII1_RD1	ALT0	IO
ENET1_RX_DATA2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RGMII	RGMII1_RD2	ALT0	IO
ENET1_RX_DATA3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RGMII	RGMII1_RD3	ALT0	IO
ENET1_RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal. In RGMII mode, contains RXDV on the rising edge of RX_CLK, and a logical derivative of RX_EV and RX_ER (RX_EV XOR RX_ER) on the falling edge of RX_CLK.	MII / RMII / RGMII	RGMII1_RX_CTL	ALT0	IO
ENET1_RX_ER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	MII / RMII	RGMII1_RXC	ALT1	IO
ENET1_TX_CLK	Input clock, which provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER.	MII	ENET1_TX_CLK	ALT0	IO
ENET1_TX_DATA0	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RMII / RGMII	RGMII1_TD0	ALT0	IO
ENET1_TX_DATA1	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RMII / RGMII	RGMII1_TD1	ALT0	IO
ENET1_TX_DATA2	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMII1_TD2	ALT0	IO
ENET1_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMII1_TD3	ALT0	IO
ENET1_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode,	MII / RMII / RGMII	RGMII1_TX_CTL	ALT0	IO

ENET2_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMII2_TD3	ALT0	IO
ENET2_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode, contains TX_EN on the rising edge of TX_CTL, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of TX_CTL.	MII / RMII / RGMII	RGMII2_TX_CTL	ALT0	IO
ENET2_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII	RGMII2_TXC	ALT1	IO

## 22.4 Clocks

The table found here describes the clock sources for ENET. Please see for clock setting, configuration and gating information.

## 22.5 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

**Table 22-3. Register map summary**

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

**ENET memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20B_4004	Interrupt Event Register (ENET2_EIR)	32	w1c	0000_0000h	<a href="#">22.5.1/908</a>
20B_4008	Interrupt Mask Register (ENET2_EIMR)	32	R/W	0000_0000h	<a href="#">22.5.2/911</a>
20B_4010	Receive Descriptor Active Register (ENET2_RDAR)	32	R/W	0000_0000h	<a href="#">22.5.3/914</a>
20B_4014	Transmit Descriptor Active Register (ENET2_TDAR)	32	R/W	0000_0000h	<a href="#">22.5.4/915</a>
20B_4024	Ethernet Control Register (ENET2_ECR)	32	R/W	<a href="#">See section</a>	<a href="#">22.5.5/916</a>
20B_4040	MII Management Frame Register (ENET2_MMFR)	32	R/W	0000_0000h	<a href="#">22.5.6/918</a>
20B_4044	MII Speed Control Register (ENET2_MSCR)	32	R/W	0000_0000h	<a href="#">22.5.7/918</a>
20B_4064	MIB Control Register (ENET2_MIBC)	32	R/W	C000_0000h	<a href="#">22.5.8/921</a>
20B_4084	Receive Control Register (ENET2_RCR)	32	R/W	05EE_0001h	<a href="#">22.5.9/922</a>
20B_40C4	Transmit Control Register (ENET2_TCR)	32	R/W	0000_0000h	<a href="#">22.5.10/925</a>
20B_40E4	Physical Address Lower Register (ENET2_PALR)	32	R/W	0000_0000h	<a href="#">22.5.11/927</a>
20B_40E8	Physical Address Upper Register (ENET2_PAUR)	32	R/W	0000_8808h	<a href="#">22.5.12/927</a>

## 22.5.1 Interrupt Event Register (ENETx\_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

**NOTE**

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode,

ENET\_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Address: Base address + 4h offset

### ENETx\_EIR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 BABR	Babbling Receive Error  Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error  Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete  This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop.  <b>NOTE:</b> The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt  Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt  Indicates a transmit buffer descriptor has been updated.

Table continues on the next page...

## ENETx\_EIR field descriptions (continued)

Field	Description
25 RXF	Receive Frame Interrupt  Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt  Indicates a receive buffer descriptor is not the last in the frame has been updated.
23 MII	MII Interrupt.  Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error  Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
21 LC	Late Collision  Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit  Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun  Indicates the transmit FIFO became empty before the complete frame was transmitted.  <b>NOTE:</b> In situations where the device has various masters generating high traffic, a FIFO underrun can occur on the transmit FIFO. To avoid transmit FIFO underrun, store and forward can be enabled in ENET_TFWR[STRFWD]. See <a href="#">STRFWD</a> . Also, a higher priority can be set for ENET traffic using available means on the central bus fabric connecting the ENET module.
18 PLR	Payload Receive Error  Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication  Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available  Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer  The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

**22.5.2 Interrupt Mask Register (ENETx\_EIMR)**

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: Base address + 8h offset

Field	Description
	corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
22 EBERR	EBERR Interrupt Mask  Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
21 LC	LC Interrupt Mask  Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
20 RL	RL Interrupt Mask  Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
19 UN	UN Interrupt Mask  Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
18 PLR	PLR Interrupt Mask  Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
17 WAKEUP	WAKEUP Interrupt Mask  Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
16 TS_AVAIL	TS_AVAIL Interrupt Mask  Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_TIMER	TS_TIMER Interrupt Mask  Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

*Table continues on the next page...*

**ENETx\_RDAR field descriptions**

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active  Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 22.5.4 Transmit Descriptor Active Register (ENETx\_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: Base address + 14h offset

### ENETx\_ECR field descriptions

Field	Description
31–18 Reserved	This field is reserved. Always write 011100000000000b to this field.
17–12 Reserved	This field is reserved. Always write 0 to this field.
11 Reserved	This field is reserved. Always write 0 to this field.
10 Reserved	This field is reserved. Always write 0 to this field.
9 Reserved	This field is reserved. Always write 0 to this field.
8 DBSWP	Descriptor Byte Swapping Enable  Swaps the byte locations of the buffer descriptors.  <b>NOTE:</b> This field must be written to 1 after reset.  0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
7 Reserved	This field is reserved. Always write 0 to this field.
6 DBGEN	Debug Enable  Enables the MAC to enter hardware freeze mode when the device enters debug mode.

Table continues on the next page...

**ENETx\_ECR field descriptions (continued)**

Field	Description
	<p>0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.</p>
5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 EN1588	<p>EN1588 Enable Enables enhanced functionality of the MAC.</p> <p>0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.</p>
3 SLEEP	<p>Sleep Mode Enable 0 Normal operating mode. 1 Sleep mode.</p>
2 MAGICEN	<p>Magic Packet Detection Enable Enables/disables magic packet detection.</p> <p><b>NOTE:</b> MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection.</p> <p><b>NOTE:</b> EIMR[WAKEUP] must be written to one if Magic packet wakeup is programmed to wake up the chip from low power mode.</p> <p>0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.</p>
1 ETHEREN	<p>Ethernet Enable Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.</p> <p>Hardware clears this field under the following conditions:</p> <ul style="list-style-type: none"> <li>• RESET is set by software</li> <li>• An error condition causes the EBERR field to set.</li> </ul> <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>• ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only after all other ENET-related registers have been configured.</li> <li>• If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must be cleared to 0 due to previous pending interrupts.</li> </ul> <p>0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.</p>
0 RESET	<p>Ethernet MAC Reset When this field is set, it clears the ETHEREN field.</p>

## 22.5.6 MII Management Frame Register (ENETx\_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ST	OP		PA			RA		TA																							
W	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### ENETx\_MMFR field descriptions

Field	Description
31–30 ST	Start Of Frame Delimiter See <a href="#">Table 22-41</a> (Clause 22) or <a href="#">Table 22-43</a> (Clause 45) for correct value.
29–28 OP	Operation Code See <a href="#">Table 22-41</a> (Clause 22) or <a href="#">Table 22-43</a> (Clause 45) for correct value.
27–23 PA	PHY Address See <a href="#">Table 22-41</a> (Clause 22) or <a href="#">Table 22-43</a> (Clause 45) for correct value.
22–18 RA	Register Address See <a href="#">Table 22-41</a> (Clause 22) or <a href="#">Table 22-43</a> (Clause 45) for correct value.
17–16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

## 22.5.7 MII Speed Control Register (ENETx\_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII\_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII\_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII\_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (that is, peripheral bus clock) is 25 MHz, programming MII\_SPEED to 0x4 results in an MDC as given in the following equation:

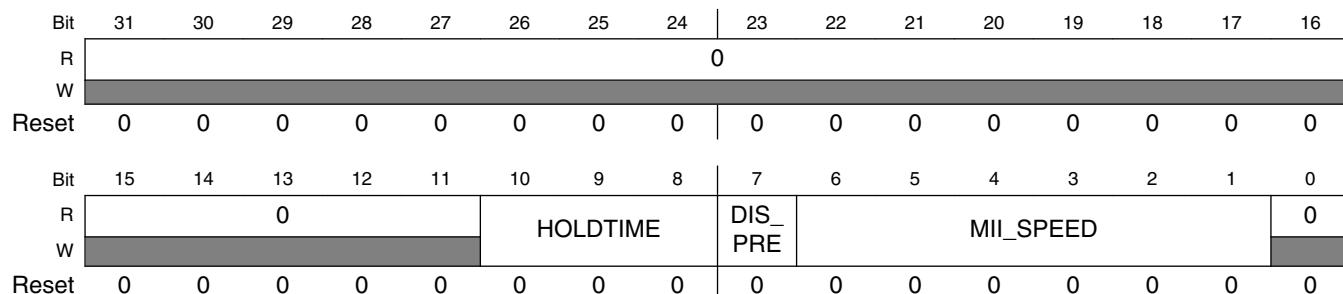

$$\text{MII clock frequency} = 25 \text{ MHz} / ((4 + 1) \times 2) = 2.5 \text{ MHz}$$

The following table shows the optimum values for MII\_SPEED as a function of IPS bus clock frequency.

**Table 22-4. Programming Examples for MSCR**

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: Base address + 44h offset

#### ENETx\_MSCR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 HOLDTIME	Hold time On MDIO Output  IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased.  000 1 internal module clock cycle 001 2 internal module clock cycles

*Table continues on the next page...*

**ENETx\_MSCR field descriptions (continued)**

Field	Description
	010 3 internal module clock cycles 111 8 internal module clock cycles
7 DIS_PRE	<p>Disable Preamble</p> <p>Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it.</p> <p>0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.</p>
6–1 MII_SPEED	<p>MII Speed</p> <p>Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of:</p> <p><math>1/((MII\_SPEED + 1) \times 2)</math> of the internal module clock frequency</p>
0 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>

## 22.5.8 MIB Control Register (ENETx\_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB\_DIS field resets to 1.

Address: Base address + 64h offset

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

R																	
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

### ENETx\_MIBC field descriptions

Field	Description
31 MIB_DIS	Disable MIB Logic  If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.
30 MIB_IDLE	MIB Idle

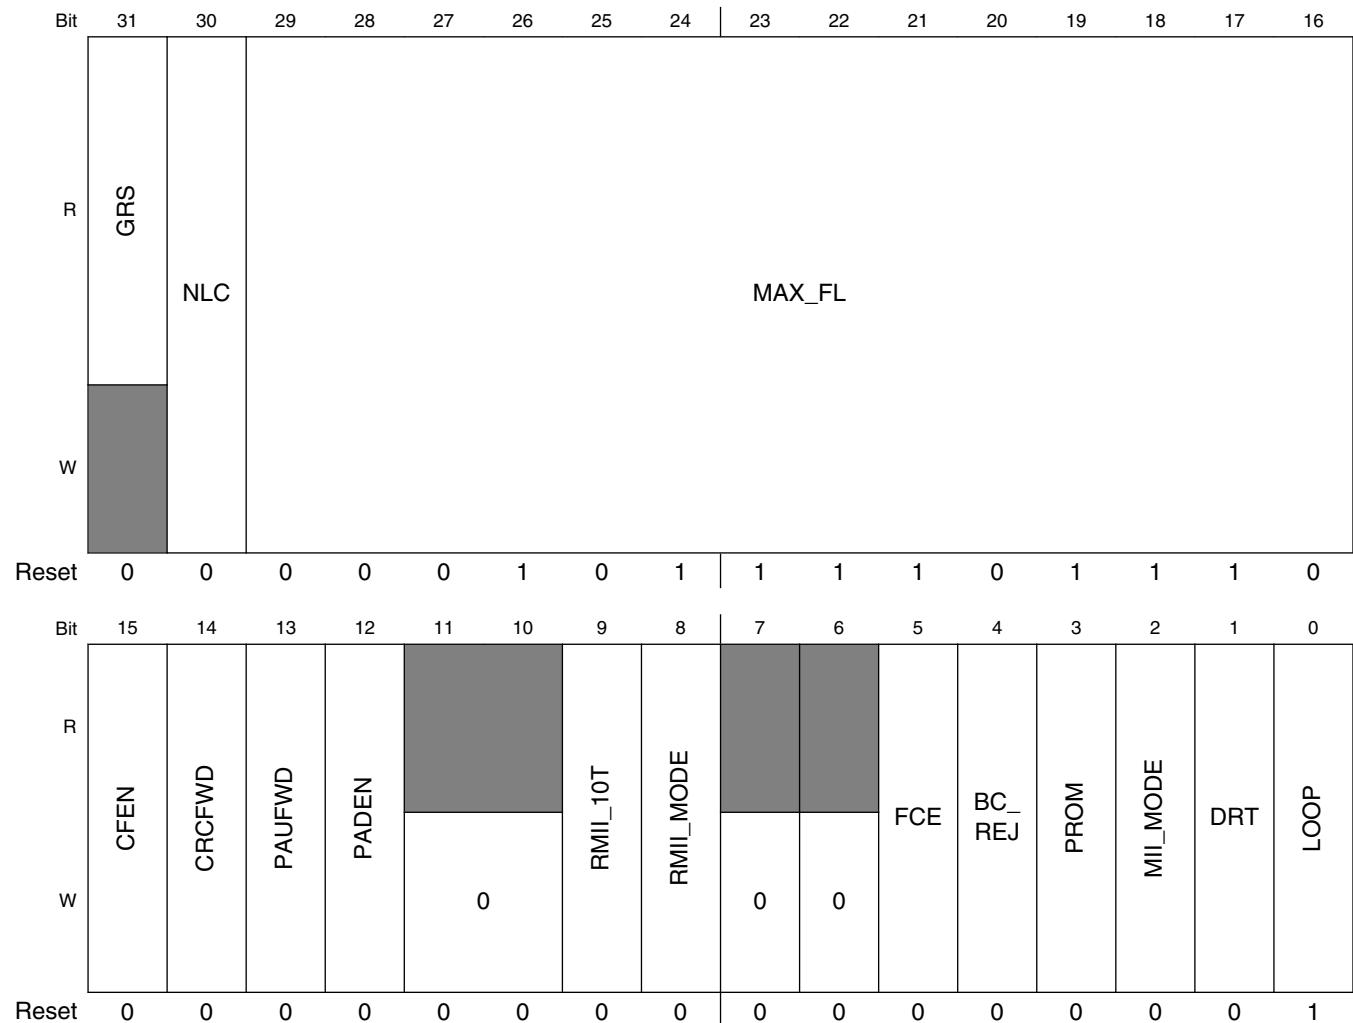

Table continues on the next page...

## ENETx\_MIBC field descriptions (continued)

Field	Description
	<p>0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.</p>
29 MIB_CLEAR	<p>MIB Clear</p> <p><b>NOTE:</b> This field is not self-clearing. To clear the MIB counters set and then clear this field.</p> <p>0 See note above. 1 All statistics counters are reset to 0.</p>
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 22.5.9 Receive Control Register (ENETx\_RCR)

Address: Base address + 84h offset

**ENETx\_RCR field descriptions**

Field	Description
31 GRS	Graceful Receive Stopped  Read-only status indicating that the MAC receive datapath is stopped.
30 NLC	Payload Length Check Disable  Enables/disables a payload length check.  0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLR] field.
29–16 MAX_FL	Maximum Frame Length  Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable  Enables/disables the MAC control frame.  0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC  Specifies whether the CRC field of received frames is transmitted or stripped.  <b>NOTE:</b> If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed.  0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
13 PAUFWD	Terminate/Forward Pause Frames  Specifies whether pause frames are terminated or forwarded.  0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive  Specifies whether the MAC removes padding from received frames.  0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
11–10 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbit/s mode of the RMII .  0 100-Mbit/s operation. 1 10-Mbit/s operation.

*Table continues on the next page...*

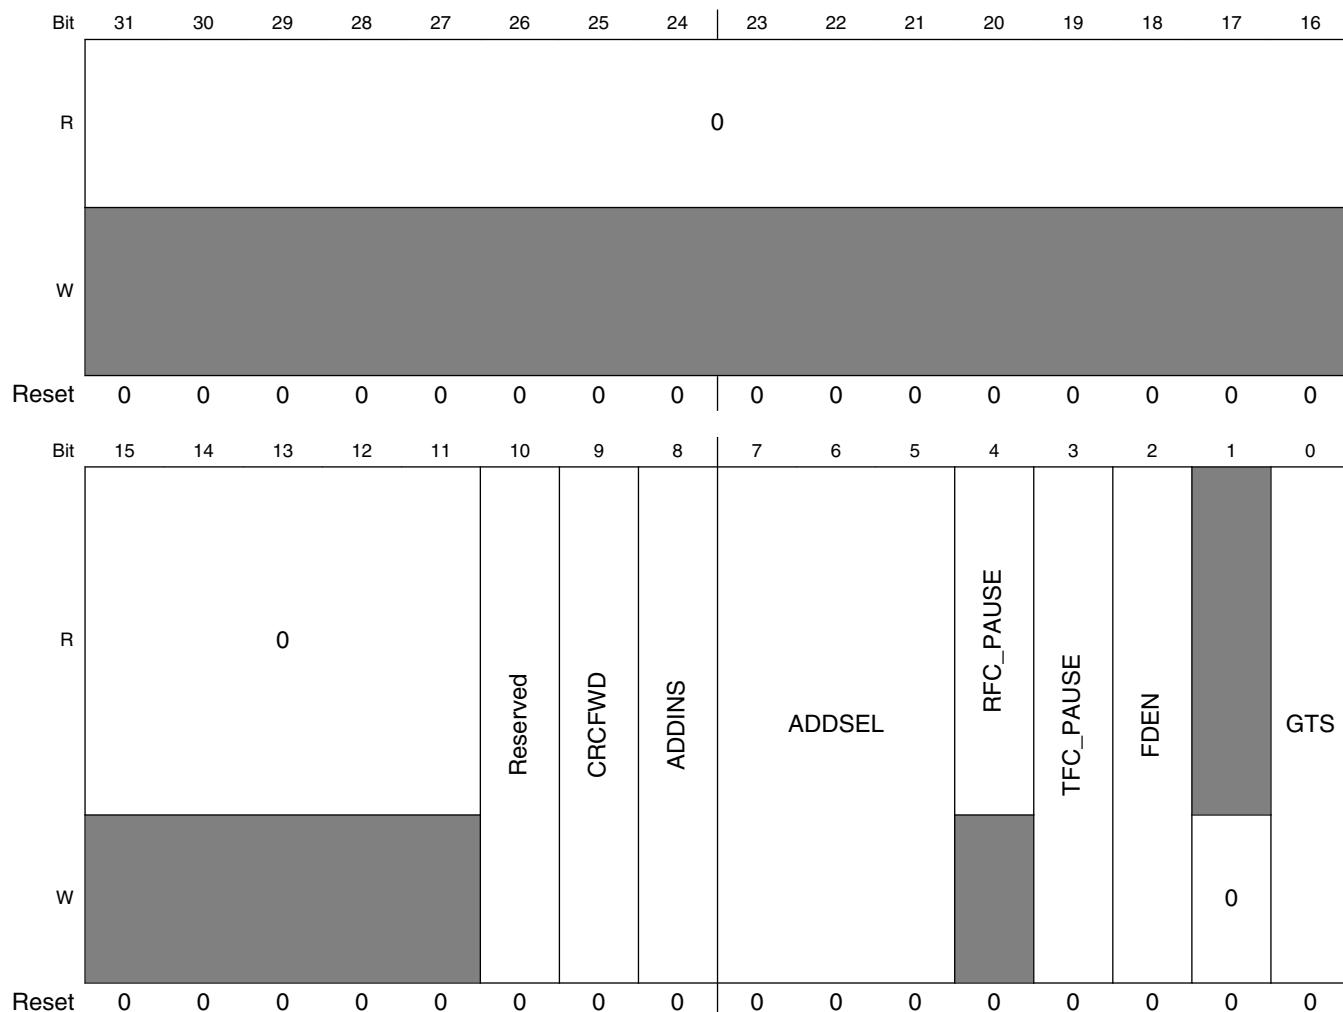

**ENETx\_RCR field descriptions (continued)**

Field	Description
8 RMII_MODE	<p>RMII Mode Enable</p> <p>Specifies whether the MAC is configured for MII mode or RMII operation .</p> <p>0 MAC configured for MII mode. 1 MAC configured for RMII operation.</p>
7 Reserved	<p>This field is reserved.</p> <p>This write-only field is reserved. It must always be written with the value 0.</p>
6 Reserved	<p>This field is reserved.</p> <p>This write-only field is reserved. It must always be written with the value 0.</p>
5 FCE	<p>Flow Control Enable</p> <p>If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.</p>
4 BC_REJ	<p>Broadcast Frame Reject</p> <p>If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.</p>
3 PROM	<p>Promiscuous Mode</p> <p>All frames are accepted regardless of address matching.</p> <p>0 Disabled. 1 Enabled.</p>
2 MII_MODE	<p>Media Independent Interface Mode</p> <p>This field must always be set.</p> <p>0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.</p>
1 DRT	<p>Disable Receive On Transmit</p> <p>0 Receive path operates independently of transmit (i.e., full-duplex mode). Can also be used to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. (Normally used for half-duplex mode.)</p>
0 LOOP	<p>Internal Loopback</p> <p>This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0.</p> <p>0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.</p>

## 22.5.10 Transmit Control Register (ENETx\_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: Base address + C4h offset

**ENETx\_TCR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC 0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.

*Table continues on the next page...*

**ENETx\_TCR field descriptions (continued)**

Field	Description
8 ADDINS	<p>Set MAC Address On Transmit</p> <p>0 The source MAC address is not modified by the MAC.</p> <p>1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.</p>
7–5 ADDSEL	<p>Source MAC Address Select On Transmit</p> <p>If ADDINS is set, indicates the MAC address that overwrites the source MAC address.</p> <p>000 Node MAC address programmed on PADDR1/2 registers.</p> <p>100 Reserved.</p> <p>101 Reserved.</p> <p>110 Reserved.</p>
4 RFC_PAUSE	<p>Receive Frame Control Pause</p> <p>This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.</p>
3 TFC_PAUSE	<p>Transmit Frame Control Pause</p> <p>Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame.</p> <p>0 No PAUSE frame transmitted.</p> <p>1 The MAC stops transmission of data frames after the current transmission is complete.</p>
2 FDEN	<p>Full-Duplex Enable</p> <p>If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.</p>
1 Reserved	<p>This field is reserved.</p> <p>This write-only field is reserved. It must always be written with the value 0.</p>
0 GTS	<p>Graceful Transmit Stop</p> <p>When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.</p>

### 22.5.11 Physical Address Lower Register (ENETx\_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: Base address + E4h offset

## ENETx PALR field descriptions

Field	Description
PADDR1	Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

### 22.5.12 Physical Address Upper Register (ENETx\_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: Base address + E8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## ENETx PAUR field descriptions

Field	Description
31–16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
TYPE	Type Field In PAUSE Frames  These fields have a constant value of 0x8808.

### 22.5.13 Opcode/Pause Duration Register (ENETx\_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: Base address + ECh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### ENETx\_TXIC field descriptions

Field	Description	
31 ICEN	Interrupt Coalescing Enable	

*Table continues on the next page...*

**ENETx\_TXIC field descriptions (continued)**

Field	Description
	0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.
30 ICCS	Interrupt Coalescing Timer Clock Source Select 0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0.  This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold  This value determines the number of frames needed to be transmitted for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0.  This field is reserved.
ICTT	Interrupt coalescing timer threshold  Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after transmitting a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame transmission defined by ICFT and starts again upon transmission of the next first frame. Must be greater than zero to avoid unpredictable behavior.

**22.5.15 Receive Interrupt Coalescing Register (ENETx\_RXIC)**

See [Interrupt coalescence](#) for more information.

Address: Base address + 100h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
30 ICCS	Interrupt Coalescing Timer Clock Source Select  0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0.  This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold  This value determines the number of frames needed to be received for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0.  This field is reserved.
ICTT	Interrupt coalescing timer threshold  Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after receiving a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame reception defined by ICFT and starts again upon reception of the next first frame. Must be greater than zero to avoid unpredictable behavior.

## 22.5.16 Descriptor Individual Upper Address Register (ENETx\_IAUR)

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: Base address + 118h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ENETx\_GALR field descriptions

Field	Description
GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

## 22.5.20 Transmit FIFO Watermark Register (ENETx\_TFWR)

If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR\_FWD is set to ‘0’, the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR\_FWD to ‘1’. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Address: Base address + 144h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### ENETx\_TFWR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 STRFWD	Store And Forward Enable 0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFWR	Transmit FIFO Write  If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins.  <b>NOTE:</b> If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given.  000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... ... 011111 1984 bytes written.

## 22.5.21 Receive Descriptor Ring Start Register (ENETx\_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

### NOTE

This register must be initialized prior to operation

## Memory map/register definition

**ENETx\_TDSR field descriptions**

Field	Description
31–3 X_DES_START	Pointer to the beginning of the transmit buffer descriptor queue.
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

**22.5.23 Maximum Receive Buffer Size Register (ENETx\_MRBR)**

The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- R\_BUF\_SIZE is concatenated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX\_FL] or larger.
- To properly align the buffer, MRBR must be evenly divisible by 64. To ensure this, set the lower two bits of R\_BUF\_SIZE to zero. The lower four bits of this register are already set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

**NOTE**

This register must be initialized before operation.

Address: Base address + 188h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## ENETx TIPG field descriptions

Field	Description
31–5 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
IPG	<p>Transmit Inter-Packet Gap</p> <p>Indicates the IPG, in bytes, between transmitted frames. Valid values range from 8 to 26. If the written value is less than 8 or greater than 26, the internal (effective) IPG is 12.</p> <p><b>NOTE:</b> The IPG value read will be the value that was written, even if it is out of range.</p>

## 22.5.32 Frame Truncation Length (ENETx\_FTRL)

Address: Base address + 1B0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ENETx\_FTRL field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TRUNC_FL	Frame Truncation Length  Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL].  <b>NOTE:</b> Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

## 22.5.33 Transmit Accelerator Function Configuration (ENETx\_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWRD] field must be set to use the checksum feature.

Address: Base address + 1C0h offset

**ENETx\_TACC field descriptions**

Field	Description
31–5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
3 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.
2–1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

**22.5.34 Receive Accelerator Function Configuration (ENETx\_RACC)**

Address: Base address + 1C4h offset

**ENETx\_RACC field descriptions**

Field	Description
31–8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

*Table continues on the next page...*

**ENETx\_RACC field descriptions (continued)**

Field	Description
7 SHIFT16	RX FIFO Shift-16  When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary.  <b>NOTE:</b> This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received.  0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
6 LINEDIS	Enable Discard Of Frames With MAC Layer Errors  0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
5–3 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
2 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum  0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
1 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum  0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
0 PADREM	Enable Padding Removal For Short IP Frames  0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

**22.5.35 Reserved Statistic Register (ENETx\_RMON\_T\_DROP)**

**ENETx\_IEEE\_R\_OCTETS\_OK field descriptions**

Field	Description
COUNT	<p>Number of octets for frames received without error</p> <p><b>NOTE:</b> Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).</p>

**22.5.89 Adjustable Timer Control Register (ENETx\_ATCR)**

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

**NOTE**

The CAPTURE and RESTART fields and bits 12 and 10 must be 0 in order to write to the other fields in this register.

Address: Base address + 400h offset

**ENETx\_ATCR field descriptions**

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SLAVE	Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
12 Reserved	This field is reserved. Always write 0 to this field.

*Table continues on the next page...*

## ENETx\_ATCR field descriptions (continued)

Field	Description
11 CAPTURE	Capture Timer Value  When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes.  0 No effect. 1 The current time is captured and can be read from the ATVR register.
10 Reserved	This field is reserved. Always write 0 to this field.
9 RESTART	Reset Timer  Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes.
8 Reserved	This field is reserved.
7 PINPER	Enables event signal output assertion on period event.  <b>NOTE:</b> Not all devices contain the event signal output. See the chip configuration details.  0 Disable. 1 Enable.
6 Reserved	This field is reserved.
5 Reserved	This field is reserved.  <b>NOTE:</b> This field must be written always with one.
4 PEREN	Enable Periodical Event  0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit.  <b>NOTE:</b> Not all devices contain the event signal output. See the chip configuration details.
3 OFFRST	Reset Timer On Offset Event  0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
2 OFFEN	Enable One-Shot Offset Event  0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
1 Reserved	This field is reserved.
0 EN	Enable Timer

### ENETx\_TCSRn field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15–11 TPWC	<p>Timer PulseWidth Control</p> <p>Specifies the pulse width associated with TMODE values of 1110 or 11X1. Updating this field takes a few cycles to register because it is synchronized to the 1588 clock. When changing this field:</p> <ol style="list-style-type: none"> <li>Always disable the channel and read the TMODE field to verify that the channel is disabled.</li> <li>Set TPWC to the desired value.</li> <li>Reenable the channel.</li> </ol> <p>00000 Pulse width is one 1588-clock cycle.      00001 Pulse width is two 1588-clock cycles.      00010 Pulse width is three 1588-clock cycles.      00011 Pulse width is four 1588-clock cycles.      ... ...      11111 Pulse width is 32 1588-clock cycles.</p>
10–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TF	<p>Timer Flag</p> <p>Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it.</p> <p>0 Input Capture or Output Compare has not occurred.      1 Input Capture or Output Compare has occurred.</p>
6 TIE	<p>Timer Interrupt Enable</p> <p>0 Interrupt is disabled      1 Interrupt is enabled</p>
5–2 TMODE	Timer Mode

Table continues on the next page...

**ENETx\_TCSRn field descriptions (continued)**

Field	Description
	<p>Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first.</p> <p>0000 Timer Channel is disabled.      0001 Timer Channel is configured for Input Capture on rising edge.      0010 Timer Channel is configured for Input Capture on falling edge.      0011 Timer Channel is configured for Input Capture on both edges.      0100 Timer Channel is configured for Output Compare - software only.      0101 Timer Channel is configured for Output Compare - toggle output on compare.      0110 Timer Channel is configured for Output Compare - clear output on compare.      0111 Timer Channel is configured for Output Compare - set output on compare.      1000 Reserved      1010 Timer Channel is configured for Output Compare - clear output on compare, set output on overflow.      10X1 Timer Channel is configured for Output Compare - set output on compare, clear output on overflow.      110X Reserved      1110 Timer Channel is configured for Output Compare - pulse output low on compare for 1 to 32 1588-clock cycles as specified by TPWC.      1111 Timer Channel is configured for Output Compare - pulse output high on compare for 1 to 32 1588-clock cycles as specified by TPWC.</p>
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
0 TDRE	Timer DMA Request Enable  0 DMA request is disabled 1 DMA request is enabled

**22.5.98 Timer Compare Capture Register (ENETx\_TCCRn)**

Address: Base address + 60Ch offset + (8d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R																	TCC																
W	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

**ENETx\_TCCRn field descriptions**

Field	Description
TCC	<p>Timer Capture Compare</p> <p>This register is double buffered between the module clock and 1588 clock domains.</p> <p>When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag.</p>

**ENETx\_TCCRn field descriptions (continued)**

Field	Description
	<p>The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow.</p> <p>When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.</p>

## 22.6 Functional description

This section provides a complete functional description of the MAC-NET core.

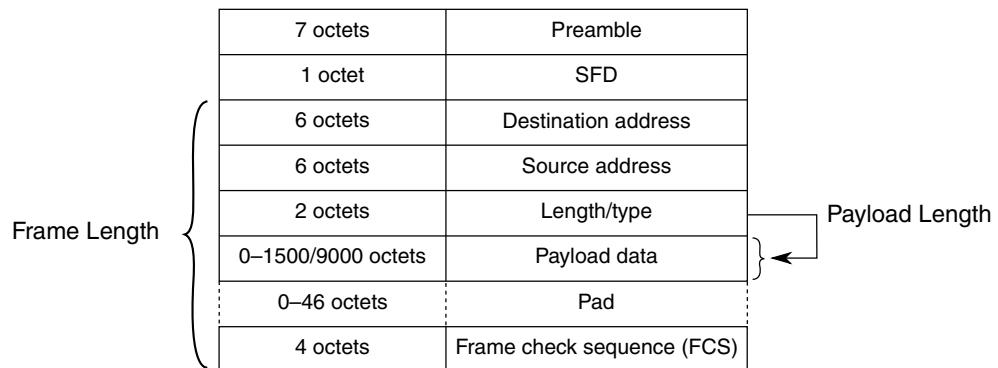

### 22.6.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

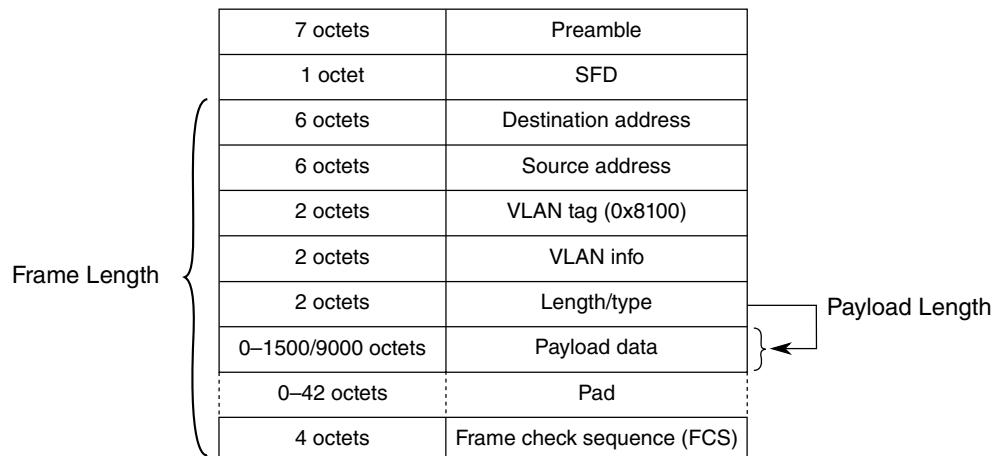

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)

**Figure 22-2. MAC frame format overview**

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

**Figure 22-3. VLAN-tagged MAC frame format overview****Table 22-5. MAC frame definition**

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. <ul style="list-style-type: none"> <li>If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame.</li> <li>If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.</li> </ul>
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in <a href="#">MAC address check</a> .

## Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

### 22.6.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

**Table 22-6. Pause Frame Format (Values in Hex)**

1	2	3	4	5	6	7	8	9	10	11	12	13	14				
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01				
Preamble							SFD	Multicast Destination Address									
15	16	17	18	19	20	21	22	23	24	25	26	27 –68					
00	00	00	00	00	00	88	08	00	01	hi	lo	00					
Source Address							Type	Opcode		P1	P2	pad (42)					
69	70	71	72														
26	6B	AE	0A														
CRC-32																	

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see [Full-duplex flow control operation](#) for details).

### 22.6.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in [Magic packet detection](#).

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

## 22.6.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

### 22.6.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

**Table 22-7. Ethernet type value examples**

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

### 22.6.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

**Table 22-8. IPv4 header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Version	IHL	TOS										Length																			
Fragment ID										Flags	Fragment offset																				
TTL		Protocol										Header checksum																			
Source address										Destination address																					
Options																															

**Table 22-9. IPv4 header fields**

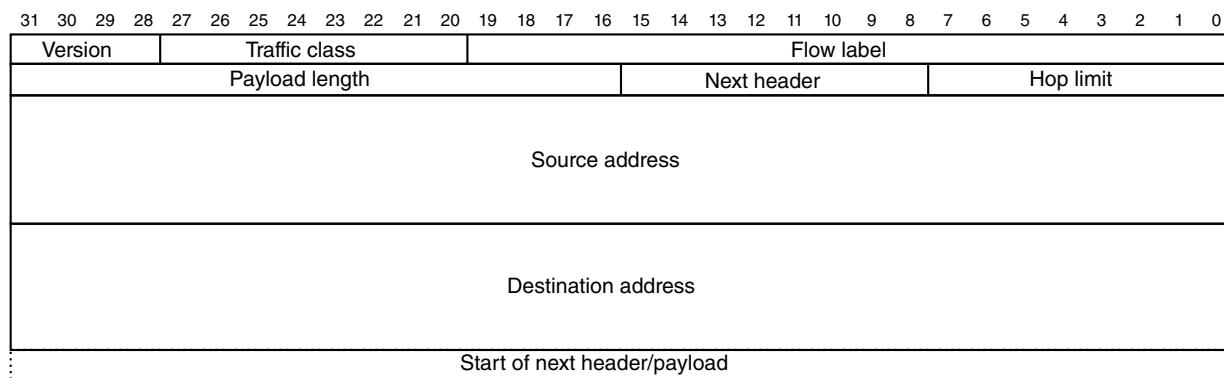

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

### 22.6.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly. The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

## Functional description

The first byte sent/received is the leftmost byte of the first word (in other words, version/traffic class fields).

**Figure 22-4. IPv6 header format**

**Table 22-10. IPv6 header fields**

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

### 22.6.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

**Table 22-11. ICMP header format**

31 30 29 28   27 26 25 24   23 22 21 20   19 18 17 16   15 14 13 12   11 10 9 8   7 6 5 4   3 2 1 0	Type	Code	Checksum
ICMP message data			

**Table 22-12. IP header fields**

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

### 22.6.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

**Table 22-13. UDP header format**

31 30 29 28   27 26 25 24   23 22 21 20   19 18 17 16   15 14 13 12   11 10 9 8   7 6 5 4   3 2 1 0	
Source port	Destination port
Length	Checksum

**Table 22-14. UDP header fields**

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

### 22.6.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

**Table 22-15. TCP header format**

31 30 29 28   27 26 25 24   23 22 21 20   19 18 17 16   15 14 13 12   11 10 9 8   7 6 5 4   3 2 1 0	
Source port	Destination port

*Table continues on the next page...*

**Table 22-15. TCP header format (continued)**

		Sequence number		
Acknowledgement number				
Offset	Reserved	Flags	Window	
Checksum		Urgent pointer		
Options				

**Table 22-16. TCP header fields**

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

## 22.6.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

### 22.6.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

#### 22.6.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

[Table 22-17](#) shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

**Table 22-17. UDP/IP multicast domains**

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

**Table 22-18. UDP port numbers**

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

### 22.6.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

**Table 22-19. PTPv2 multicast domains**

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

### 22.6.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

## Functional description

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

### 22.6.3.2.1 PTPv1 header

Table 22-20. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in [Table 22-21](#) :

Table 22-21. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

### 22.6.3.2.2 PTPv2 header

**Table 22-22. Common PTPv2 message header**

Offset	Octets	Bits									
		7	6	5	4	3	2	1	0		
0	1	transportSpecific								messageId	
1	1	reserved								versionPTP = 0x2	
2	2	messageLength									
4	1	domainNumber									
5	1	reserved									
6	2	flags									
8	8	correctionField									
16	4	reserved									
20	10	sourcePortIdentity									
30	2	sequenceId									
32	1	control									
33	1	logMeanMessageInterval									

The type of message is encoded in the field messageId as follows:

**Table 22-23. PTPv2 message type identification**

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message
0xc	SIGNALING	General message
0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO\_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

**Table 22-24. PTPv2 message flags field definitions**

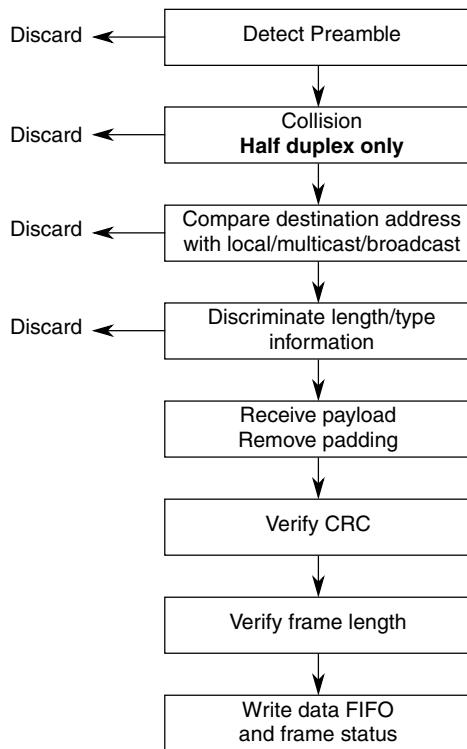

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

## 22.6.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing
- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

**Figure 22-5. MAC receive flow**

#### 22.6.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

#### 22.6.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

### 22.6.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

#### 22.6.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled (RCR[PROM] = 1) no address checking is performed and all unicast frames are accepted.

#### 22.6.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in ENET $n$ \_GAUR/GALR (group address hash match) or ENET $n$ \_IAUR/IALR (individual address hash match).
- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET $n$ \_GAUR (msb = 1) or ENET $n$ \_GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

If Promiscuous mode is enabled (ENET $n$ \_RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET $n$ \_GAUR/GALR and ENET $n$ \_IAUR/IALR settings.

#### 22.6.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC\_REJ is cleared or ENET $n$ \_RCR[PROM] is set. If PROM is cleared when ENET $n$ \_RCR[BC\_REJ] is set, all broadcast frames are rejected.

**Table 22-25. Broadcast address reject programming**

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

#### 22.6.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC\_REJ is set
- A unicast is received that does not match either:

- Node address (PALR[PADDR1] and PAUR[PADDR2])
- Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

#### **22.6.4.4 Frame length/type verification: payload length check**

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

#### **22.6.4.5 Frame length/type verification: frame length check**

When the receive frame length exceeds MAX\_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET $n$ \_FTRL[TRUNC\_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

#### **22.6.4.6 VLAN frames processing**

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

### 22.6.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET<sub>n</sub>\_RCR[FCE] is cleared and are forwarded to the client interface when ENET<sub>n</sub>\_RCR[PAUFWD] is set.

### 22.6.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET<sub>n</sub>\_RCR[CRCFWD] is cleared and ENET<sub>n</sub>\_RCR[PADEN] is set.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the  $x^{31}$  term as right-most bit of the first octet. The CRC bits are thus received in the following order:  $x^{31}, x^{30}, \dots, x^1, x^0$ .

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

### 22.6.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET<sub>n</sub>\_RCR[PADEN].

#### Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the

padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

## 22.6.5 MAC transmit

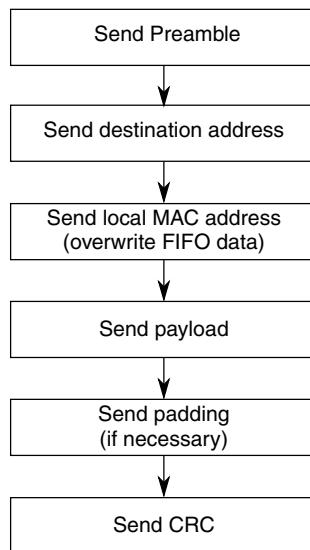

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET $n$ \_TCR[TFC\_PAUSE] is set with ENET $n$ \_OPD[PAUSE\_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC\_PAUSE is set with PAUSE\_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

**Figure 22-6. Frame transmit overview**

### 22.6.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

### 22.6.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET $n$ \_TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET $n$ \_TCR[ADDINS] = 0)

### 22.6.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the FCS field so that the  $x^{31}$  term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order:  $x^{31}$ ,  $x^{30}, \dots, x^1, x^0$ .

#### **22.6.5.4 Inter-packet gap (IPG)**

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENETn\_TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS de-assertion.

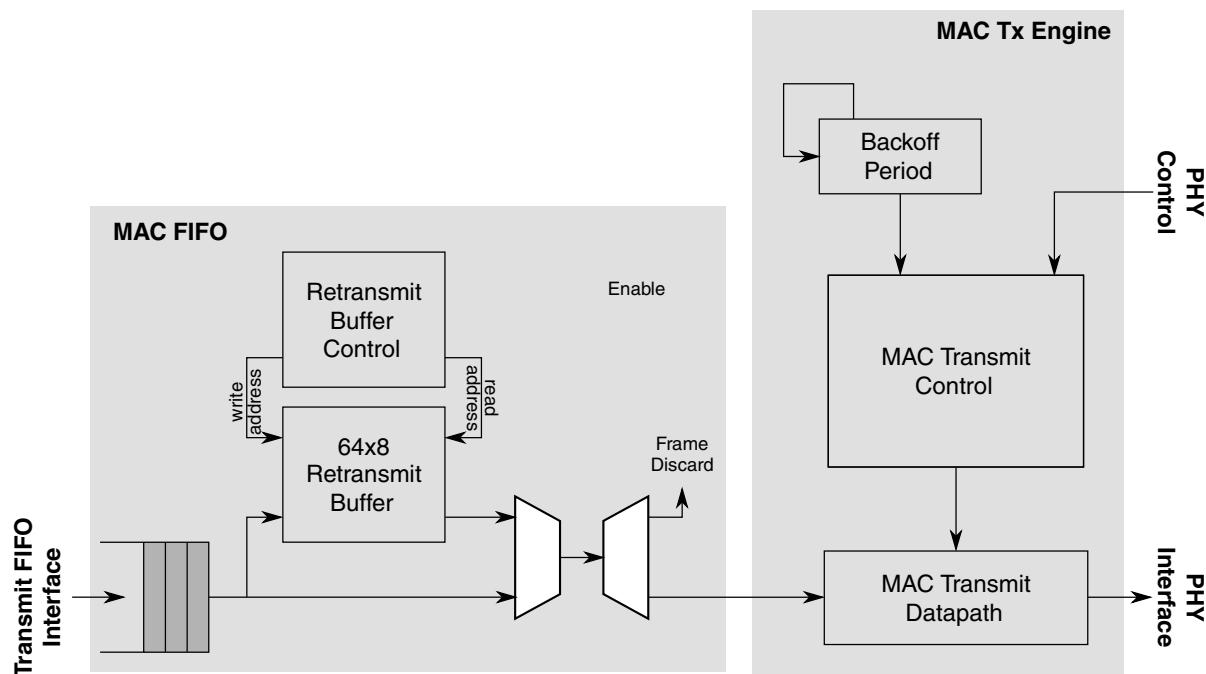

#### **22.6.5.5 Collision detection and handling — half-duplex operation only**

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

**Figure 22-7. Packet re-transmit overview**

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the  $n^{\text{th}}$  re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$ ; where  $n$  is the number of retransmissions and  $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by  $N = 10$  as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET $n$ \_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

### warning

Ethernet PHYs that support the SQE Test, or "heartbeat," feature must disable this feature. When this feature is enabled,

the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

## 22.6.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

### 22.6.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if `ENETn_RCR[FCE]` is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets `ENETn_TCR[RFC_PAUSE]`.

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets `RFC_PAUSE` to zero.

If `ENETn_RCR[FCE]` cleared, the MAC ignores received pause frames.

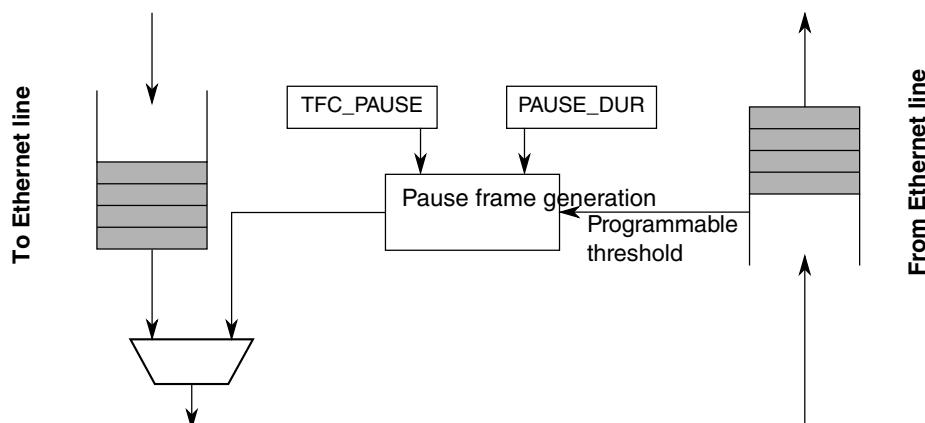

Optionally and independent of `ENETn_RCR[FCE]`, pause frames are forwarded to the client interface if `PAUFWD` is set.

### 22.6.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET<sub>n</sub>\_TCR[TFC\_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC\_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET<sub>n</sub>\_OPD[PAUSE\_DUR].

**Figure 22-8. Pause frame generation overview**

#### Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

## 22.6.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

### 22.6.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET $n$ \_ECR[SLEEP]. At the same time ENET $n$ \_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, if ENET is enabled, write 1 to ENET $n$ \_ECR[SLEEP] before entering into low power mode.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

### 22.6.7.2 Magic packet detection

The core is designed to detect magic packets (see [Magic packets](#)) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

### 22.6.7.3 Wakeup

When a magic packet is detected, indicated by ENET $n$ \_EIR[WAKEUP], ENET $n$ \_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET $n$ \_ECR[MAGICEN], disabling magic packet detection.

## 22.6.8 IP accelerator functions

The following sections describe the IP accelerator functions.

### 22.6.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

**Table 22-26. IPv4 pseudo-header for checksum calculation**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
Zero	Protocol																		TCP/UDP length												

**Table 22-27. IPv6 pseudo-header for checksum calculation**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
TCP/UDP length																															
Zero																													Next header		

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

### 22.6.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

### 22.6.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET $n$ \_TACC and ENET $n$ \_RACC registers.

When enabled, the valid frame data is arranged as shown in [Table 22-28](#).

**Table 22-28. 64-bit interface data structure with SHIFT16 enabled**

63 56	55 48	47 40	39 32	31 24	23 16	15 8	7 0
-------	-------	-------	-------	-------	-------	------	-----

*Table continues on the next page...*

**Table 22-28. 64-bit interface data structure with SHIFT16 enabled (continued)**

Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value	
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6	
...								

### 22.6.8.3.1 Receive processing

When ENET $n$ \_RACC[SHIFT16] is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

#### Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

### 22.6.8.3.2 Transmit processing

When ENET $n$ \_TACC[SHIFT16] is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

### 22.6.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (ENET $n$ \_RSFL cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than MAX\_FL
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (RX\_ERR asserted during reception)

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENETn\_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

### **22.6.8.5 IPv4 fragments**

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBD[FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBD[Payload checksum].

#### **Note**

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

### **22.6.8.6 IPv6 support**

The following sections describe the IPv6 support.

### 22.6.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see [32-bit Ethernet payload alignment](#)).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

### 22.6.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

## 22.6.9 Resets and stop controls

The following sections describe the resets and stop controls.

### 22.6.9.1 Hardware reset

To reset the Ethernet module, set ENET $n$ \_ECR[RESET].

### 22.6.9.2 Soft reset

When ENET $n$ \_ECR[ETHER\_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

### 22.6.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

### 22.6.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER\_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

#### 22.6.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET $n$ \_TCR[GTS] is set by software.
- ENET $n$ \_TCR[TFC\_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see [Sleep mode](#)).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

#### 22.6.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see [Magic packet detection](#)). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

### **Note**

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

#### **22.6.9.4.3 Graceful stop interrupt (GRA)**

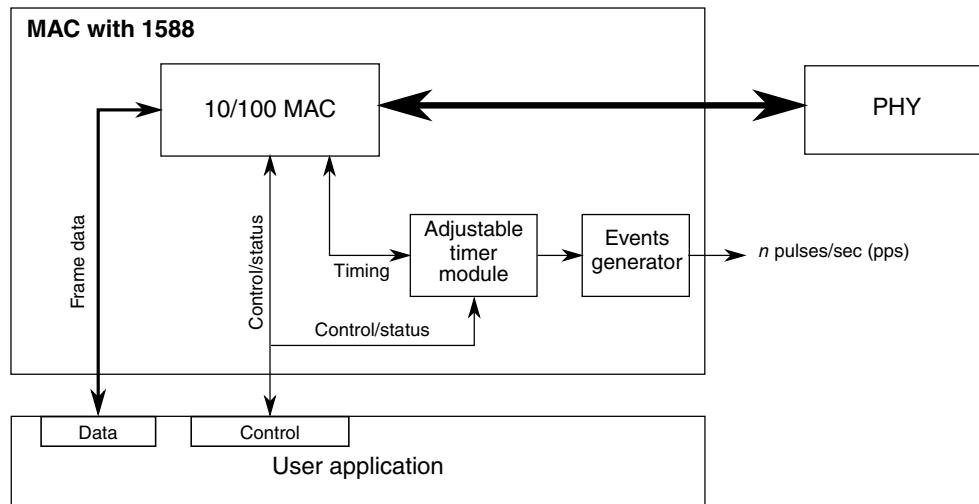

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC\_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

## 22.6.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set ENETn\_ECR[EN1588] to enable 1588 support.

**Figure 22-9. IEEE 1588 functions overview**

### 22.6.10.1 Adjustable timer module

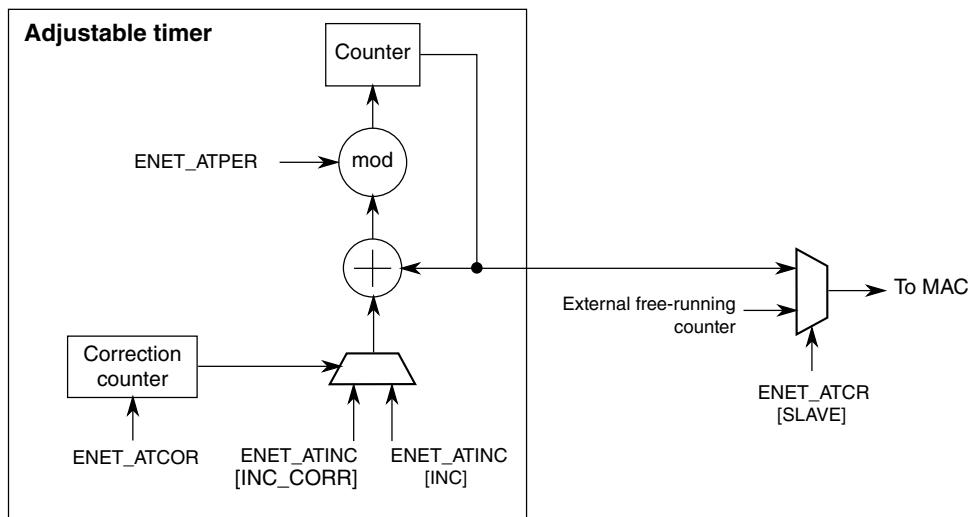

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to  $(1 \times 10^9)-1$ . The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

#### 22.6.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

**Figure 22-10. Adjustable timer implementation detail**

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in ENET $n$ \_ATINC. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in ENET $n$ \_ATPER, defines the modulo when the counter wraps. In a typical implementation, the period is set to  $1 \times 10^9$  so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value (Current + Inc  $-(1 \times 10^9)$ ), assuming the period is set to  $1 \times 10^9$ .

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in ENET $n$ \_ATCOR, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in ENET $n$ \_ATINC. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode (ENET $n$ \_ATCR[SLAVE] = 1), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set ENET $n$ \_ATINC[INC] to the value of the master, since it is used for internal comparisons.

### 22.6.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET $n$ \_ATSTMP. ENET $n$ \_EIR[TS\_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET $n$ \_EIR[TS\_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET $n$ \_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

### 22.6.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

### 22.6.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to  $(1 \times 10^9) - 1$ . In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at  $1 \times 10^9$ .

## 22.6.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

### 22.6.10.5.1 Input capture

The TCCR $n$  capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588\_TMR $n$  signals. An event will cause the corresponding TCSR $n$ [TF] timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the TCSR $n$ [TIE] field, an interrupt can be generated.

### 22.6.10.5.2 Output compare

The TCCR $n$  compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the TCCR $n$  register, the corresponding flag, TCSR $n$ [TF], is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by TCSR $n$ [TIE], will be generated. The corresponding 1588\_TMR $n$  output signal will be asserted according to TCSR $n$ [TMODE].

### 22.6.10.5.3 DMA requests

A DMA request can be enabled by setting TCSR $n$ [TDRE]. The corresponding DMA request is generated when the TCSR $n$ [TF] timer flag is set. When the DMA has completed, the corresponding TCSR $n$ [TF] flag is cleared.

## 22.6.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 256 words.

### 22.6.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

**Table 22-29. Receive FIFO thresholds definition**

Register	Description
ENETn_RSFL [RX_SECTION_FULL]	<p>When the FIFO level reaches the ENETn_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENETn_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again.</p> <p>If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted.</p> <p>To enable store and forward on the receive path, clear ENETn_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO.</p> <p>When programming a non-zero value to ENETn_RSFL (cut-through operation) it should be greater than ENETn_RAEM.</p>
ENETn_RAEM [RX_ALMOST_EMPTY]	<p>When the FIFO level reaches the ENETn_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application).</p> <p>It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO.</p> <p>Set ENETn_RAEM to a minimum of six.</p>
ENETn_RAFL [RX_ALMOST_FULL]	<p>When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow.</p> <p>The corresponding error status is set when the frame is delivered to the application.</p> <p>Set ENETn_RAFL to a minimum of 4.</p>
ENETn_RSEM [RX_SECTION_EMPTY]	<p>When the FIFO level reaches the ENETn_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client.</p> <p>When the FIFO level goes below the value programmed in ENETn_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client.</p> <p>Clearing ENETn_RSEM disables any pause frame generation.</p>

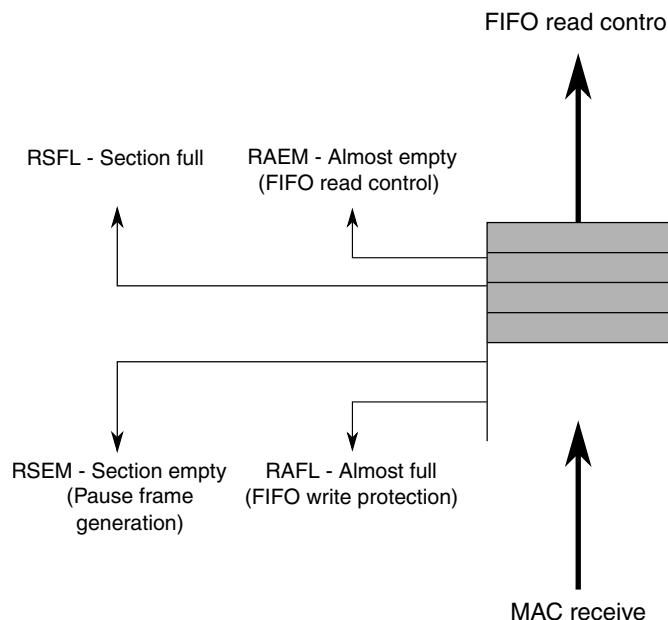

Figure 22-11. Receive FIFO overview

## 22.6.11.2 Transmit FIFO

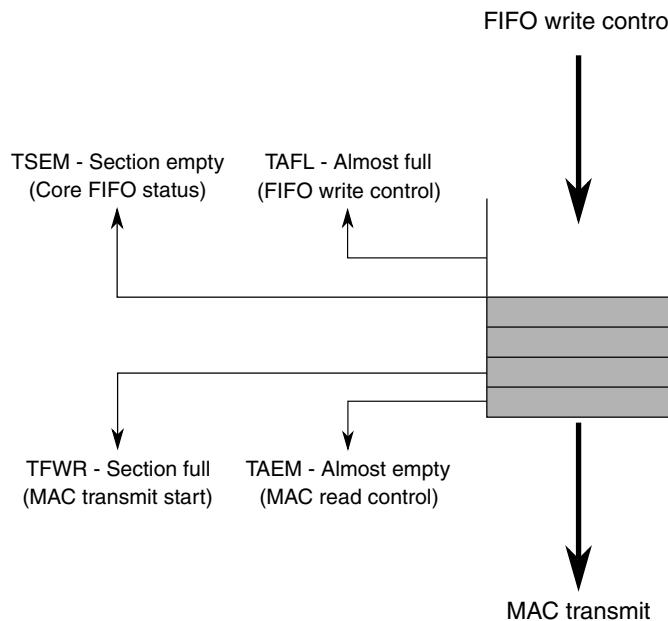

Four programmable thresholds are available which control the core operation as described below.

Table 22-30. Transmit FIFO thresholds definition

Register	Description
ENETn_TAEM [TX_ALMOST_EMPTY]	When the FIFO level reaches the ENETn_TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENETn_TAEM to a minimum of 4.
ENETn_TAFL [TX_ALMOST_FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENETn_TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an MII error indication. Set ENETn_TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENETn_TSEM [TX_SECTION_EMPTY]	When the FIFO level reaches the ENETn_TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENETn_TSEM is 0, the signal is never deasserted.
ENETn_TFWR	When the FIFO level reaches the ENETn_TFWR value and when STRFW is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

**Table 22-30. Transmit FIFO thresholds definition**

Register	Description
	If a complete frame has a size smaller than the ENETn_TFWR threshold, the MAC also transmits the frame to the line. To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.

**Figure 22-12. Transmit FIFO overview**

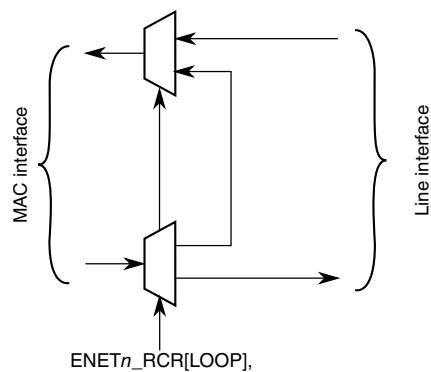

## 22.6.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENETn\_RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENETn\_RCR register fields:

**Table 22-31. Loopback options**

Register field	Description
LOOP	Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces. In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s))

**Figure 22-13. Loopback options**

## 22.6.13 Legacy buffer descriptors

To support the Ethernet controller on previous chips, legacy FEC buffer descriptors are available. To enable legacy support, write 0 to ENET $n$ \_ECR[1588EN].

### NOTE

- The legacy buffer descriptor tables show the byte order for little-endian chips. **DBSWP** must be set to 1 after reset to enable little-endian mode.

### 22.6.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. [Table 22-35](#) contains the descriptions for each field.

**Table 22-32. Legacy FEC receive buffer descriptor (RxBD)**

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	Data length															
Offset + 2	E	RO1	W	RO2	L	—	—	M	BC	MC	LG	NO	—	CR	OV	TR
Offset + 4	Rx data buffer pointer — low halfword															
Offset + 6	Rx data buffer pointer — high halfword															

### 22.6.13.2 Legacy transmit buffer descriptor

The following table shows the legacy FEC transmit buffer descriptor. [Table 22-37](#) contains the descriptions for each field.

**Table 22-33. Legacy FEC transmit buffer descriptor (TxBD)**

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	Data Length															
Offset + 2	R	TO1	W	TO2	L	TC	ABC <sup>1</sup>	—	—	—	—	—	—	—	—	—
Offset + 4	Tx Data Buffer Pointer — low halfword															
Offset + 6	Tx Data Buffer Pointer — high halfword															

1. This field is not supported by the uDMA.

### 22.6.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENETn\_ECR[1588EN].

#### NOTE

The enhanced buffer descriptor tables show the byte order for little-endian chips. [DBSWP](#) must be set to 1 after reset to enable little-endian mode.

#### 22.6.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. [Table 22-35](#) contains the descriptions for each field.

**Table 22-34. Enhanced uDMA receive buffer descriptor (RxBD)**

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	Data length															
Offset + 2	E	RO1	W	RO2	L	—	—	M	BC	MC	LG	NO	—	CR	OV	TR
Offset + 4	Rx data buffer pointer – low halfword															
Offset + 6	Rx data buffer pointer – high halfword															

*Table continues on the next page...*

## Functional description

**Table 22-34. Enhanced uDMA receive buffer descriptor (RxBD) (continued)**

Offset + 1E	—	—	—	—	—	—	—	—	—	—	—	—	—	—

**Table 22-35. Receive buffer descriptor field definitions**

Word	Field	Description
Offset + 0	15–0 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
Offset + 2	15 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 2	14 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENETn_RDSR.
Offset + 2	12 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	11 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
Offset + 2	10–9	Reserved, must be cleared.
Offset + 2	8 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use the this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM bits are set. 0 The frame was received because of an address recognition hit. 1 The frame was received because of promiscuous mode.

Table continues on the next page...

**Table 22-35. Receive buffer descriptor field definitions (continued)**

Word	Field	Description
		The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 2	7 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 2	6 MC	Set if the DA is multicast and not BC.
Offset + 2	5 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 2	4 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 2	3	Reserved, must be cleared.
Offset + 2	2 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 2	1 OV	Overrun. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 2	0 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 4	15–0 Data buffer pointer low	Receive data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	Receive data buffer pointer, high halfword <sup>1</sup>
Offset + 8	15–13 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.
Offset + 8	12–6	Reserved, must be cleared.
Offset + 8	5 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + 8	4 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + 8	3	Reserved, must be cleared.
Offset + 8	2 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.

*Table continues on the next page...*

**Table 22-35. Receive buffer descriptor field definitions (continued)**

Word	Field	Description
Offset + 8	1 IPV6	IPv6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + 8	0 FRAG	IPv4 Fragment. This is an accelerator option. This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + A	15 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + A	14–11	Reserved, must be cleared.
Offset + A	10 PE	PHY Error. This field is written by the uDMA. Set to "1" when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + A	9 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + A	8 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + A	7 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the <i>dma_int_rxb / dma_int_rxfevent</i> .
Offset + A	6–0	Reserved, must be cleared.
Offset + C	15–0 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + E	15–11 Header length	<p>Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers:</p> <ul style="list-style-type: none"> <li>• ICMP/IP: 6 (5 IP header, 1 ICMP header)</li> <li>• UDP/IP: 7 (5 IP header, 2 UDP header)</li> <li>• TCP/IP: 10 (5 IP header, 5 TCP header)</li> </ul> <p>This field is only valid if the L field is set.</p>
Offset + E	10–8	Reserved, must be cleared.
Offset + E	7–0 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		

*Table continues on the next page...*

**Table 22-35. Receive buffer descriptor field definitions (continued)**

Word	Field	Description
	1588 timestamp	
Offset + 18 — Offset + 1E	15–0	Reserved, must be cleared.

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 64. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

## 22.6.14.2 Enhanced transmit buffer descriptor

**Table 22-36. Enhanced transmit buffer descriptor (TxBD)**

**Table 22-37. Enhanced transmit buffer descriptor field definitions**

Word	Field	Description
Offset + 0	15–0	Data length, written by user.
	Data Length	Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 2	15 R	Ready. Written by the MAC and you.

*Table continues on the next page...*

**Table 22-37. Enhanced transmit buffer descriptor field definitions (continued)**

Word	Field	Description
		<p>0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered.</p> <p>1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.</p>
Offset + 2	14 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	13 W	<p>Wrap. Written by user.</p> <p>0 The next buffer descriptor is found in the consecutive location</p> <p>1 The next buffer descriptor is found at the location defined in ETDSR.</p>
Offset + 2	12 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	11 L	<p>Last in frame. Written by user.</p> <p>0 The buffer is not the last in the transmit frame</p> <p>1 The buffer is the last in the transmit frame</p>
Offset + 2	10 TC	<p>Transmit CRC. Written by user, and valid only when L is set.</p> <p>0 End transmission immediately after the last data byte</p> <p>1 Transmit the CRC sequence after the last data byte</p> <p>This field is valid only when the L field is set.</p>
Offset + 2	9 ABC	<p>Append bad CRC.</p> <p><b>Note:</b> This field is not supported by the uDMA and is ignored.</p>
Offset + 2	8–0	Reserved, must be cleared.
Offset + 4	15–0 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	<p>Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller.</p> <p><b>NOTE:</b> For optimal performance, make the transmit buffer pointer evenly divisible by 64.</p>
Offset + 8	15 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + 8	14	Reserved, must be cleared.
Offset + 8	13 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + 8	12 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.

*Table continues on the next page...*

**Table 22-37. Enhanced transmit buffer descriptor field definitions (continued)**

Word	Field	Description
Offset + 8	11 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + 8	10 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + 8	9 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + 8	8 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type than a timestamp frame. This field is valid only when the L field is set.
Offset + 8	7–0	Reserved, must be cleared.
Offset + A	15	Reserved, must be cleared.
Offset + A	14 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + A	13 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + A	12 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	11 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	10–0	Reserved, must be cleared.
Offset + C	15–0	Reserved, must be cleared.
Offset + E	15–0	Reserved, must be cleared.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16	1588 timestamp	
Offset + 18–Offset + 1E	15–0	Reserved, must be cleared.

## 22.6.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

### 22.6.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

**Table 22-38. FIFO interface data structure**

	63	56 55	48 47	40 39	32 31	24 23	16 15	8 7	0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	
...	...								

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

**Note**

On transmit, if ENET $n$ \_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET $n$ \_PAUR and ENET $n$ \_PALR registers.

**Table 22-39. FIFO interface frame format**

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

**Table 22-40. FIFO interface VLAN frame format**

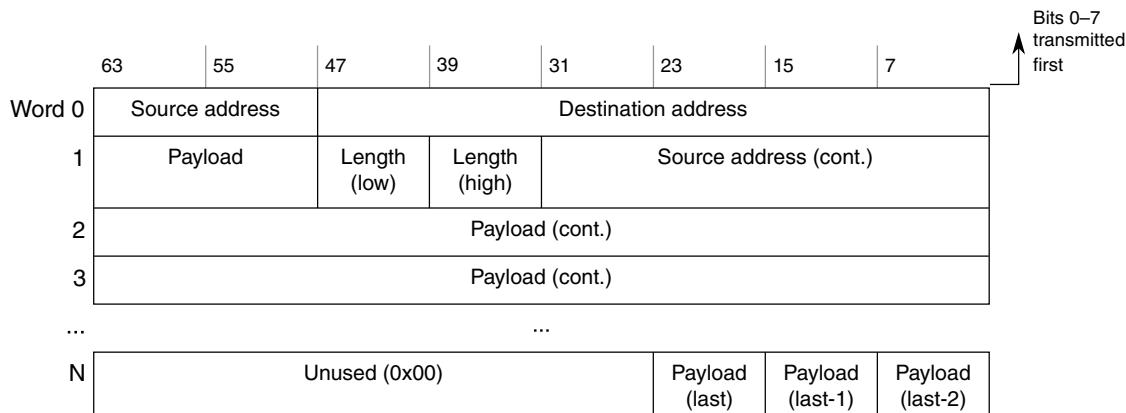

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

**Note**

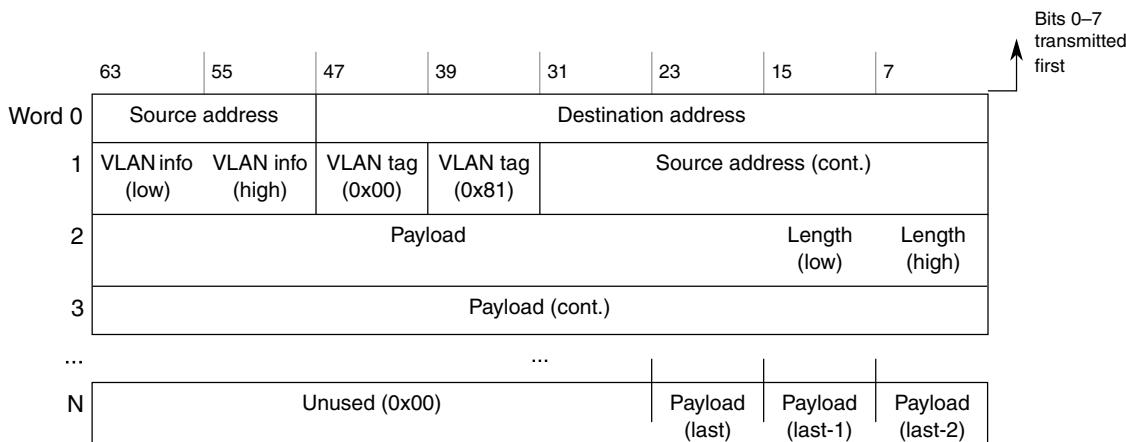

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

### 22.6.15.2 Data structure examples

## Functional description

**Figure 22-14. Normal Ethernet frame 64-bit mapping example**

**Figure 22-15. VLAN-tagged frame 64-bit mapping example**

If CRC forwarding is enabled ( $\text{CRCFWD} = 0$ ), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

### 22.6.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See [Enhanced buffer descriptors](#) for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error),  $\text{RxBD[ME]}$  is also set with the last data of the frame.

## 22.6.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

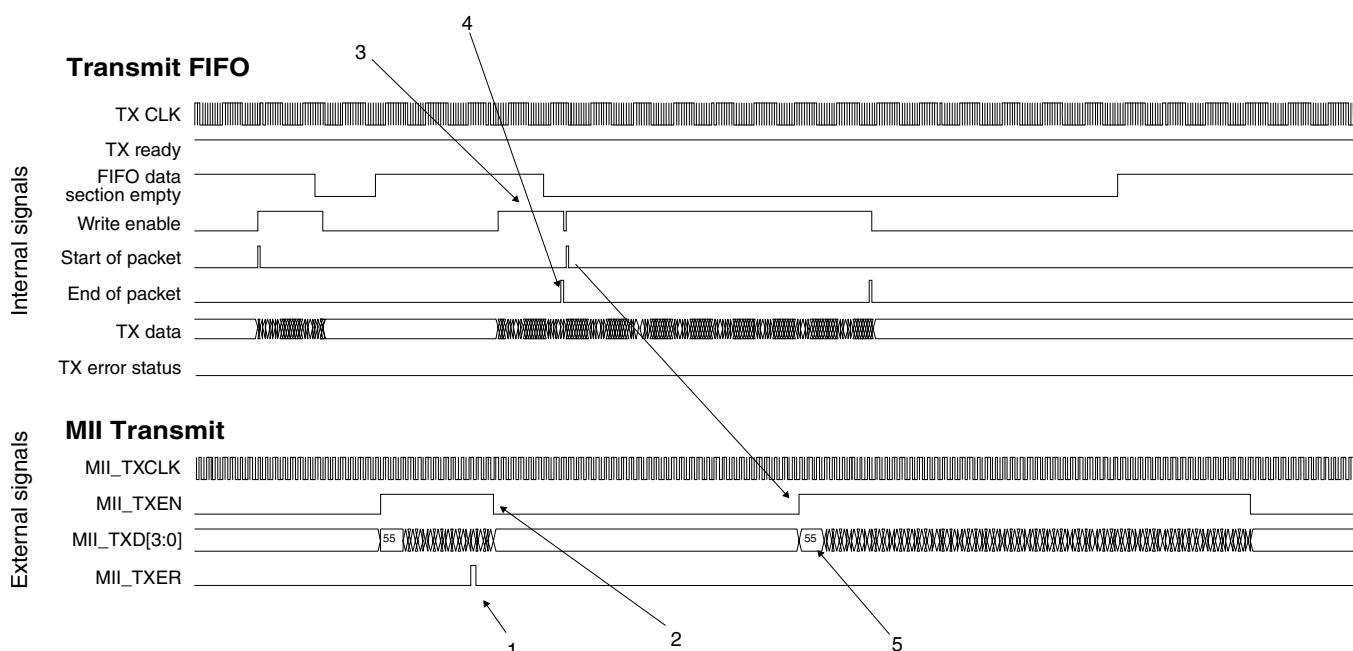

### 22.6.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII\_TXER) (1 in [Figure 22-16](#)) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII\_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

**Figure 22-16. Transmit FIFO underflow protection**

## 22.6.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurrence.

### Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET $n$ \_ECR[ETHER\_EN], to clear the FIFOs and prepare for normal operation again.

## 22.6.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

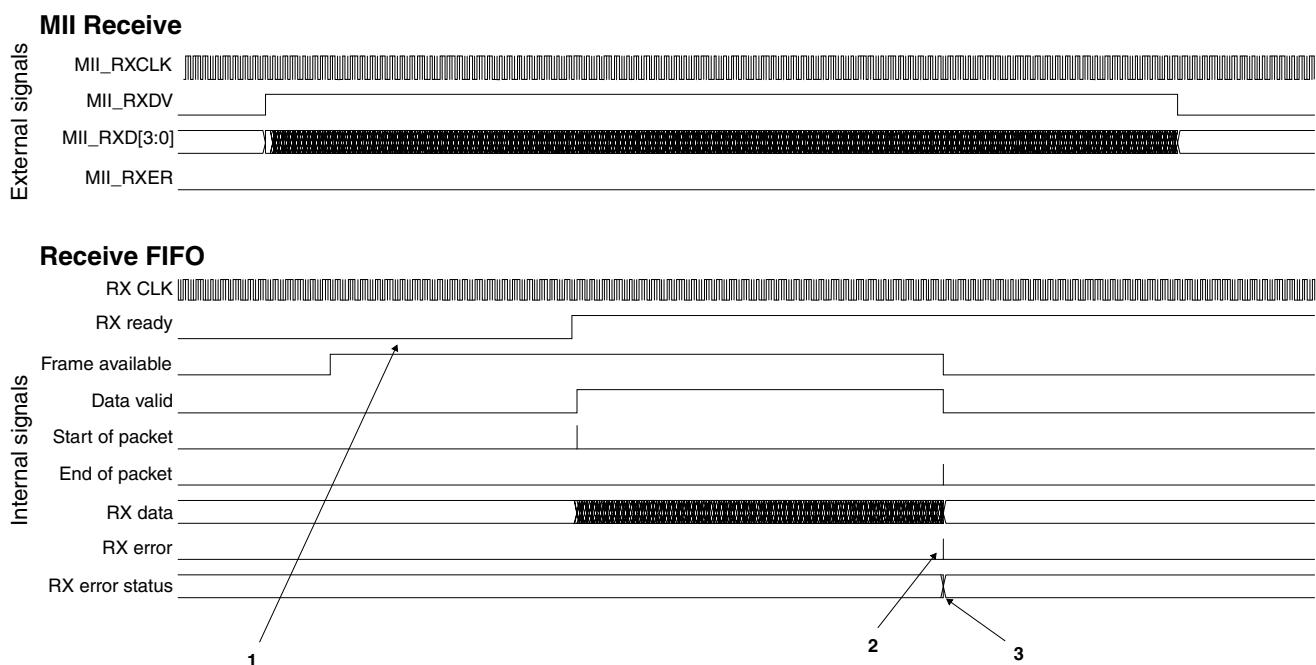

Figure 22-17. Receive FIFO overflow protection

## 22.6.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

### 22.6.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

**Table 22-41. MDIO clause 22 frame structure**

ST	OP	PHYADR	REGADR	TA	DATA
----	----	--------	--------	----	------

**Table 22-42. MDIO frame field descriptions**

Field	Description
ST (2 bits)	Start indication field, programmed with ENETn_MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENETn_MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENETn_MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENETn_MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENETn_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data	Data, set by ENETn_MMFR[DATA]. Written to or read from the PHY

**Table 22-42. MDIO frame field descriptions**

Field	Description
(16 bits)	

### 22.6.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

**Table 22-43. MDIO clause 45 frame structure**

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

**Table 22-44. MDIO clause 45 frame field descriptions**

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENETn_MMFR[OP]. See <a href="#">Table 22-45</a> for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENETn_MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.

*Table continues on the next page...*

**Table 22-44. MDIO clause 45 frame field descriptions (continued)**

Field	Description
ADDR/DATA	16-bit address (for address write) or data, set by ENETn_MMFR[DATA], written to or read from the PHY.

**Table 22-45. MDIO Clause 45 Transactions**

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

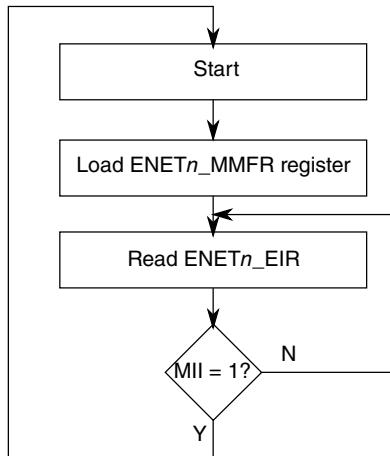

### 22.6.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENETn\_MSCR[MII\_SPEED].

### 22.6.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET $n$ \_MMFR) according to the description provided in MII Management Frame Register (ENET $n$ \_MMFR).

To check when the programmed access completes, read the ENET $n$ \_EIR[MII] field.

**Figure 22-18. MDIO access overview**

## 22.6.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets

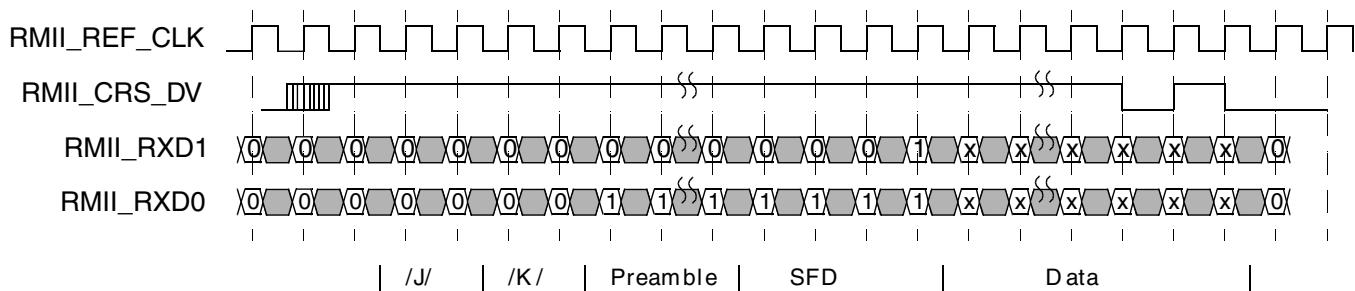

The following table shows how to configure ENET registers to select each interface.

Mode	RCR[RMII_10T]	RCR[RMII_MODE]
MII - 10 Mbit/s	—	0
MII - 100 Mbit/s	—	0
RMII - 10 Mbit/s	1	1
RMII - 100 Mbit/s	0	1

### 22.6.18.1 RMII interface

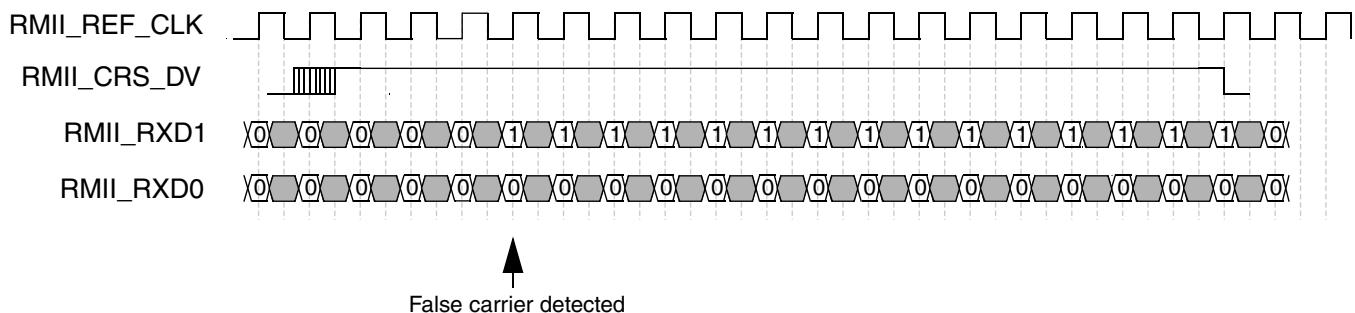

In RMII receive mode, for normal reception following assertion of CRS\_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears ( $\text{RXD}[1:0]=01$ ) and the MACs begin capturing data following detection of SFD.

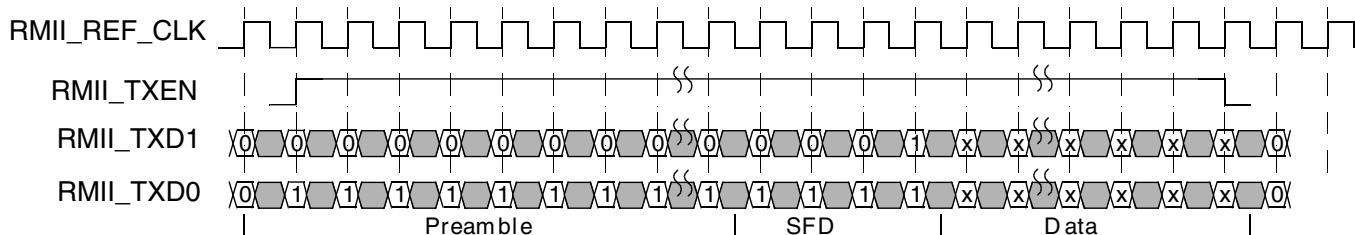

**Figure 22-19. RMII receive operation**

If a false carrier is detected (bad SSD), then  $\text{RXD}[1:0]$  is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded ( $\text{RXD}[1:0] = 01$ ).

**Figure 22-20. RMII receive operation with false carrier**

In RMII transmit mode,  $\text{TXD}[1:0]$  provides valid data for each REF\_CLK period while TXEN is asserted.

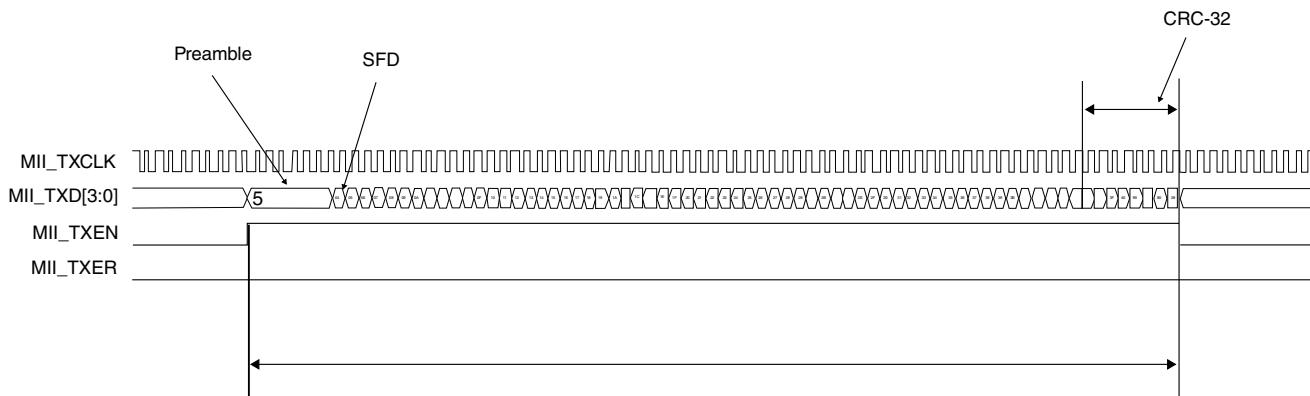

**Figure 22-21. RMII transmit operation**

## 22.6.18.2 MII Interface — transmit

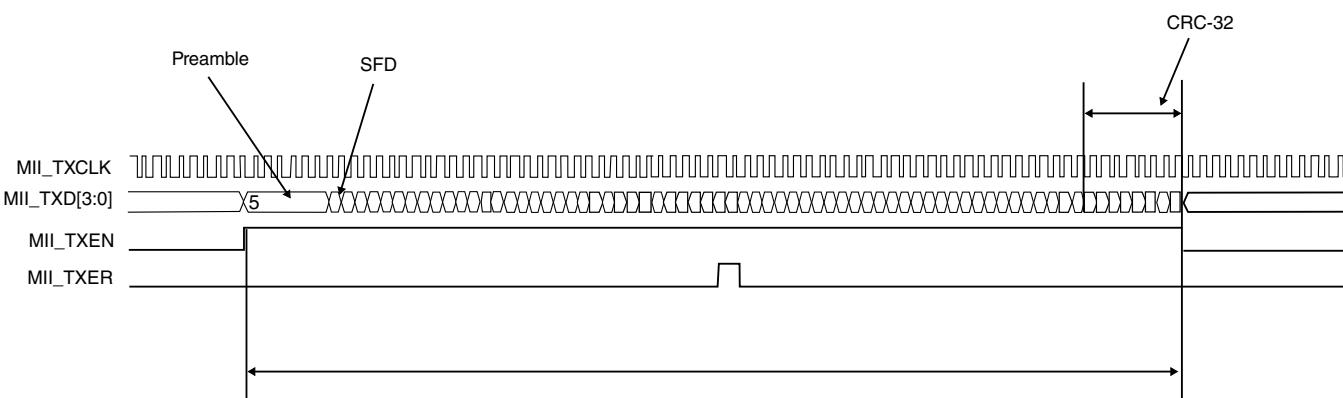

On transmit, all data transfers are synchronous to MII\_TXCLK rising edge. The MII data enable signal MII\_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII\_TXD[3:0] bus.

Between frames, MII\_TXEN remains deasserted.

**Figure 22-22. MII transmit operation**

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII\_TXER error signal for one clock cycle at any time during the packet transfer.

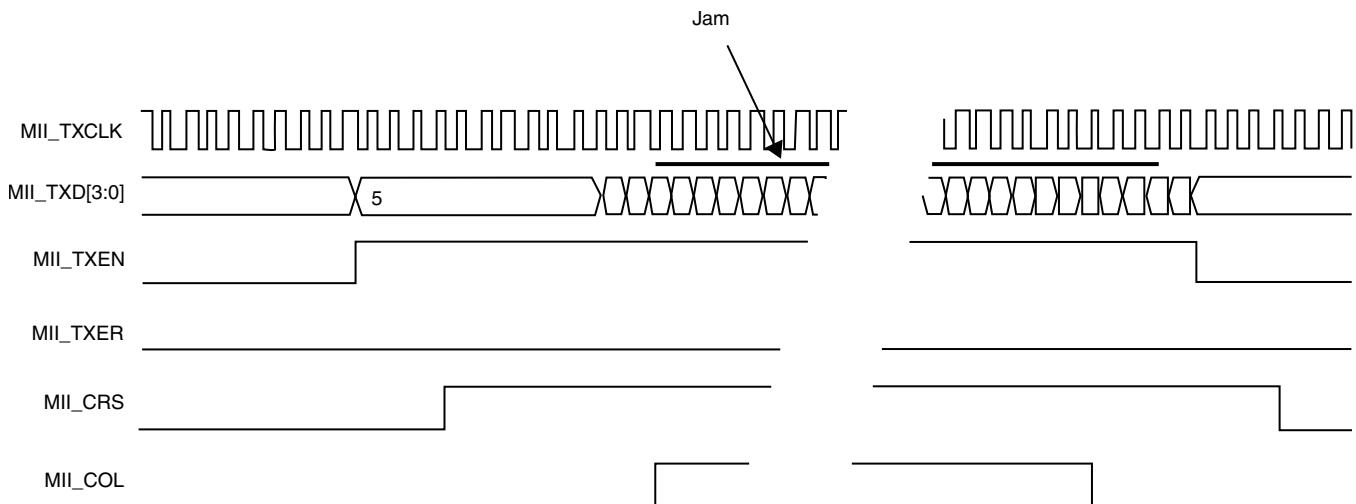

**Figure 22-23. MII transmit operation — errored frame**

### 22.6.18.2.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII\_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See [Collision detection in half-duplex mode](#) for details)

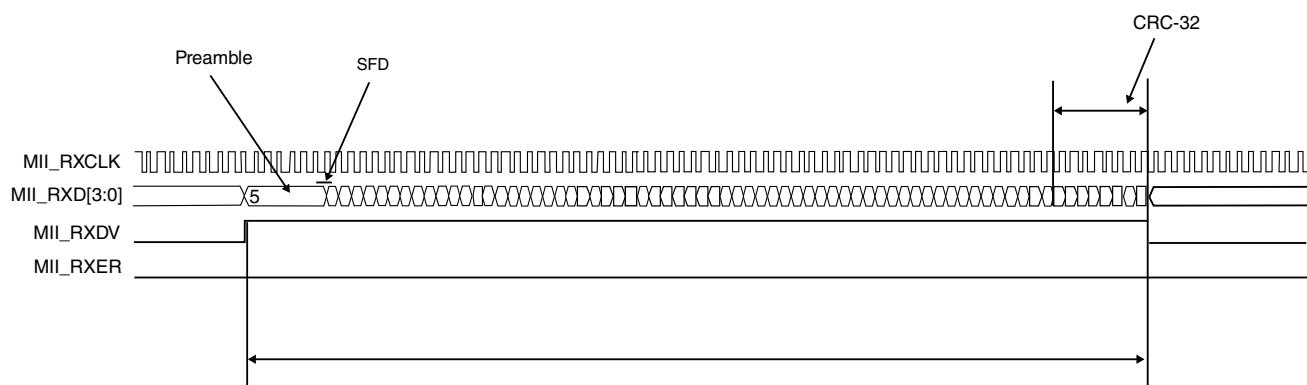

**Figure 22-24. MII transmit operation — transmission with collision**

### 22.6.18.3 MII interface — receive

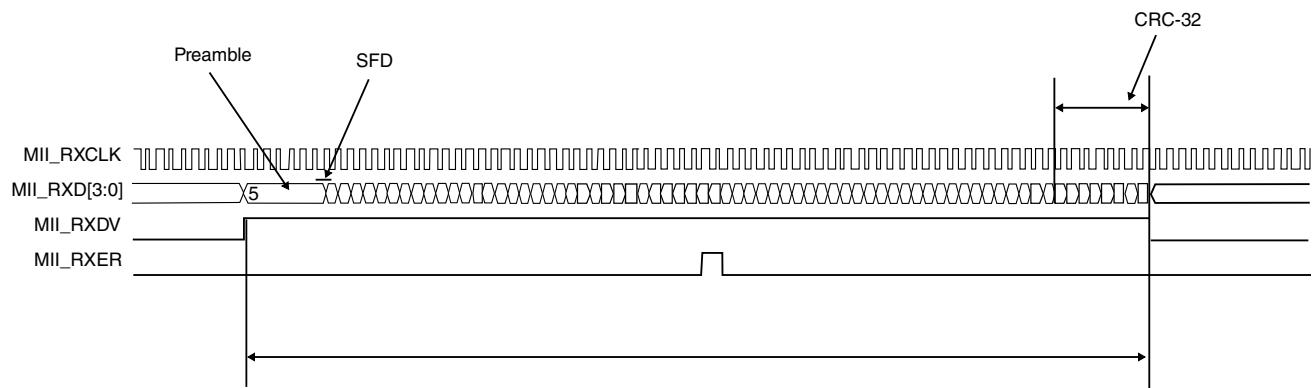

On receive, all signals are sampled on the MII\_RXCLK rising edge. The MII data enable signal, MII\_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII\_RXD[3:0] bus.

Between frames, MII\_RXDV remains deasserted.

**Figure 22-25. MII receive operation**

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII\_RXER, for at least one clock cycle at any time during the packet transfer.

**Figure 22-26. MII receive operation — errored frame**

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

## 22.6.19 Interrupt coalescence

The purpose of the interrupt coalescing is to reduce the number of interrupts generated by the MAC so as to reduce the CPU loading.

To facilitate this interrupt coalescing, these registers are available with the same control and configuration fields.

- [Transmit Interrupt Coalescing Register \(ENET\\_TXIC\)](#)
- [Receive Interrupt Coalescing Register \(ENET\\_RXIC\)](#)

When coalescing is enabled by asserting the corresponding ICEN field and such interrupt is also enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt when the threshold number of frames is reached (defined by ICFT) or when the threshold timer expires (defined by ICTT).

When coalescing is disabled by de-asserting ICEN, but interrupt is enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt as they are received without using coalescing. Interrupt coalescing is done for each transmit and receive queue/class independently.

### 22.6.19.1 Interrupt coalescence setup

Interrupt coalescence supports both legacy and enhanced BDs. The following guidelines are recommended when setting up interrupt coalescence.

- When the MAC is configured for enhanced (IEEE 1588) mode, that is, enhanced BDs:
  - Set the INT bit in the enhanced received buffer descriptor to one.
  - Set the INT bit in the enhanced transmit buffer descriptor(s) to one.
- Clear the TXB and RXB fields in the EIMR register.

### 22.6.19.2 Updating the frame count threshold on-the-fly

To update the ICFT field in the RXIC and TXIC registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

#### **NOTE**

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new threshold value to the ICFT field.
3. Set ICEN to one.

#### **NOTE**

The ICFT field can be updated on-the-fly without disabling the ICEN field. The hardware interrupt will continue and there is a possibility that an interrupt will occur depending on the state of the hardware counter and the previous ICFT value.

### 22.6.19.3 Updating the timer threshold on-the-fly

To update the ICTT field in the RXIC and TXIC registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

#### **NOTE**

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new timer value to the ICTT field.
3. Set ICEN to one.

# Chapter 23

## Electrophoretic Display Controller (EPDC)

### 23.1 Overview

This chapter describes the architecture of the EPDC. It provides a detailed description of the block for digital design and software driver development.

The EPDC is a feature-rich, low power and high performance direct drive active matrix EPD controller. It is specifically designed to drive E•INK™ EPD panels supporting a wide variety of TFT backplanes. The goal of the EPDC is to provide an efficient SoC integration of this functionality for e-paper applications, allowing a significant BOM cost saving over an external solution, while reaching much higher levels of performance at lower power. The EPDC module is defined in the context of an optimized HW/SW partitioning and works in conjunction with the PXP IP module to form a complete display processing solution.

The key features of the EPDC are as follows:

- TFT resolutions up to 4096 x 4096 pixels with 20 Hz refresh (programmable up to 8191 x 8191)
- TFT resolutions up to 1650 x 2332 pixels at 106 Hz refresh
- Industry standard bus interfaces (AMBA AXI and APB)
- Up to 5-bit pixel representation for up to 32 greyscale levels
- Up to 64 concurrent updates with partial update support, except for 32(5-bit) grey level panel for which only 16 concurrent updates can be used
- Automatic collision handling when used in conjunction with the i.MX device driver
- Flexible direct drive TFT interface supporting next generation source driver, gate driver and panel architectures, including LVDS, DDR and multi-level source drivers
- Unified generic configurable timing mode (Pigeon Mode) available on most panel timing control signals
- High performance pixel pipeline architecture to guarantee refresh performance at high pixel rates without the need for high internal clocking
- Ability to process multiple updates asynchronously to refresh/update operations with ability to intercept each frame scan will multiple update requests

- Performance tuning capabilities which can interface with SoC level memory arbitration mechanisms further guaranteeing frame refresh operation
- Decoupled clocking architecture allowing for independent and asynchronous clock sources for memory bus, peripheral bus and pixel clock domains
- Full and partial update mode support
- Support for up to 256 waveform modes, also support optimal waveform auto-selection based on grey level of the pixels being updated
- Low power mode operation via architectural clock gating
- Update buffer analysis functions to get information like collision rectangle, grey level

### 23.1.1 EPDC Block Diagram

The top-level view of the EPDC is shown in the following figure.

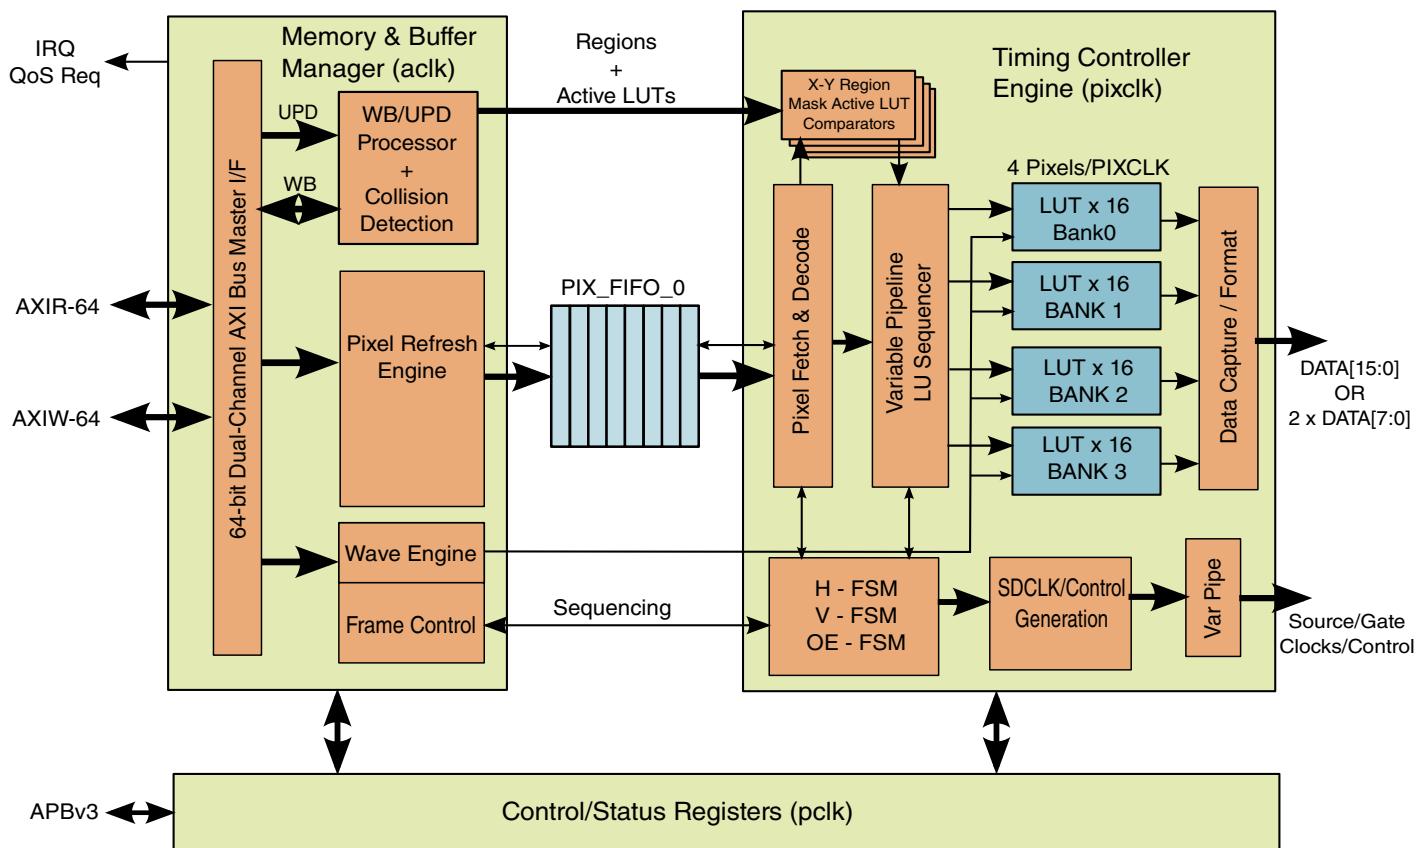

Figure 23-1. EPDC Top-Level Block Diagram

The EPD function can be separated into two major asynchronous processes. The first is the front end portion which is responsible for processing display updates. The second is the function of driving waveforms to the TFT panel in order to update the screen contents (the refresh operation). The EPDC is comprised of two major submodules (MBM and TCE) which mirror the architectural split in the EPD algorithm. These submodules communicate through a number of control/sequencing signals and data (through the pixel FIFOs and LUT memories):

- Memory and Buffer Manager (MBM): This submodule is responsible for all memory-related operations and LUT life cycle control, which involves the frame count management for all updates. This module is clocked by both *aclk* and *pixclk*. It also encapsulates the APB register interface which is clocked by *aclk* too.
- Timing Control Engine (TCE): This submodule is responsible for performing TFT scan frame refreshes. It is clocked by *pixclk*. It also houses the LUT memory system.

## 23.2 External Signals

The following table describes the external signals of EPDC:

## 23.3 Programming Model

From an application perspective, the EPDC HW/SW solution aims to abstract much of the details of driving an EPD display from the user space.

This is achieved through a blend of HW features and the kernel-level SW driver implementation of the EPD frame buffer. The scope of this chapter mostly pertains to EPDC HW but in order to correctly define the context of the programming model, certain assumptions about the driver architecture (including use of the ePXP IP) are described below.

### 23.3.1 Assumptions

The scope of the EPDC does not include certain functions performed by the driver and application layer.

These features are as follows:

- Maintenance of update and collision lists. This includes, but is not limited to, responsibility for managing update order. Updates are processed in the order they are received by the EPDC. Actual start times of multiple updates can occur on the same

- frame scan. All pixels contained within an update will always begin on the same frame scan.
- Border control. This function is assumed to be performed by a GPIO functionality.
  - EPD Panel Power Management. It is assumed that the driver and application layers will control the panel PMIC functions including relevant interfaces such as I<sup>2</sup>C and 4-wire power sequencing signals.
  - Reading and decompression of the waveform file. This is assumed to be unpacked, reformatted and written to system memory into a form that is easily accessed by the EPDC.
  - Waveform mode selection. The EPDC provides a mechanism through its histogram analysis feature (which can be run as part of any frame/region processing operations) to allow the SW driver to characterize the region/buffer in terms of gray-map content. For example, EPDC can determine if the update region (considering only those pixels undergoing a transition) contains only 2, 4, 8 or 16 gray levels, HW can automatically select waveform mode according to a programmed LUT holding mapping between grey level and waveform mode. SW driver can also manually choose the appropriate waveform update mode (e.g., when doing an update to repair ghosting artifacts).

### **23.3.2 Register Space (Write/Set/Clear/Toggle)**

The EPDC registers utilize four word address locations per 32-bit register.

For control registers (especially interrupts), this provides for a unique address for the following operations:

- Write (0x0). The base address of the register allows full writes to the 32-bit register.
- Set (0x4). This address allows a set operation on the register or its fields; writing a 1 to a register bit/field with the set address will set that bit. Writing a 0 to the set address has no effect.
- Clear (0x8). This address allows a clear operation on the register or its fields; writing a 1 to a register bit/field with the clear address will clear that bit or field.

#### **NOTE**

Interrupt status bits (such as those contained in EPDC\_IRQ) must be cleared with the clear address only. Writing to the EPDC\_IRQ register with a 0 will not clear the interrupt status/source. Writing a 0 to the clear address has no effect.

- Toggle (0xc). This address allows a toggle operation on the register or its fields; writing a 1 to a register bit/field with the toggle address will invert the state of that bit/field. This address is especially useful because it provides the ability to perform a

read-modify-write operation with a single write operation. Writing a 0 to the toggle address has no effect.

### 23.3.3 Interrupts

#### 23.3.3.1 Interrupt Sources

The EPDC contains 72 ( 64 of LUT completes IRQs and 8 of common IRQs ) unique interrupt sources. Each interrupt source has an interrupt status bit captured in EPDC\_IRQ /EPDC\_IRQ1/EPDC\_IRQ2 .

When an interrupt event occurs, the appropriate bit within the EPDC\_IRQ\* register is set by the EPDC. Each of the bits in EPDC\_IRQ is first AND'ed with its enable bit (in EPDC\_IRQ\_MASK\*), and then the masked bits are logically OR'ed together to generate the final output.

#### 23.3.3.2 Enabling/Masking Interrupts

Each of the EPDC interrupt sources can be individually enabled through the bits in the EPDC\_IRQ\_MASK\* register.

Even if an interrupt source is masked out (IRQ\_EN bit set to 0), its status will still be available in the EPDC\_IRQ\* register. The difference is that it does not result in the interrupt line being asserted.

#### 23.3.3.3 Handling/Clearing Interrupts

When the software driver is entered as a result of an EPDC interrupt it should read the EPDC\_IRQ\* interrupt status register.

Because multiple interrupts may have fired, in the case of a collision for example, both WB\_CMPLT\_IRQ and LUT\_COL IRQ fields of EPDC\_IRQ will be set. Once the interrupt has been handled, the driver should clear the interrupt source by writing to the CLEAR address (see [Register Space \(Write/Set/Clear/Toggle\)](#) for details).

When collision has occurred and the LUT\_COL\_IRQ bit is set, SW will handle the collision and clear LUT\_COL\_IRQ. Please note HW will also clear the entire EPDC\_STATUS\_COL\* register at the sametime on LUT\_COL\_IRQ clearing by SW.

### 23.3.4 Controller Setup

Before screen update operations can be performed, the EPDC should be configured appropriately.

These rudimentary setup operations include:

- Waveform data must be present in memory (in a format that is consistent with the method in which the EPDC accesses it). Because the format of the waveform data is supplier proprietary information, it is not discussed in this chapter.
- Configuring the panel architecture parameters (source and gate-driver configuration)
- Configuring line and frame timing parameters
- Initializing the working buffer and panel

#### 23.3.4.1 Memory Requirements

EPDC requires continuous access to the unpacked waveform data, the update region buffer, and its working buffer.

These are all expected to reside in system memory (typically external DRAM). As such, each has particular requirements:

- The Working Buffer (WB), which is pointed to by EPDC\_WB\_ADDR, must have EPDC\_RES[HORIZONTAL] x EPDC\_RES[VERTICAL] x 2 bytes allocated. This buffer is used by the EPDC to process updates and perform TFT refresh operations.
  - EPDC\_RES[HORIZONTAL] mod 4 must equal to 0 for memory allocation calculations because the EPDC constructs each line of the working buffer at a 64-bit boundary.
- The Update Buffer, which is pointed to by EPDC\_UPD\_ADDR (and can be redefined with a different address for each update), must have the following allocation in memory:
  - a. when stride feature not enabled
    - EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_SIZE[WIDTH] bytes
    - Note that EPDC\_UPD\_SIZE[WIDTH] mod 8 must equal to 0 for memory allocation purposes. This means that for the address size allocation, the WIDTH field must be rounded up to the nearest number so that it can be divided by 8. This is because the EPDC reads each line of the update buffer at a 64-bit boundary (it should be noted that this is consistent with the ePXP IP output). The actual value programmed for the update can be at the pixel granularity.
  - b. when stride feature enabled

- EPDC\_UPD\_SIZE[HEIGHT] x EPDC\_UPD\_STRIDE bytes
- EPDC\_UPD\_SIZE[WIDTH] is used to reflect valid bytes in a line with EPDC\_UPD\_STRIDE pixels, STRIDE  $\geq$  WIDTH
- no alignment requirement on line start or end, no padding necessary unless STRIDE > WIDTH
- The waveform data set size is a function of mode count, number of temperature tables and number of frames required for each temperature-compensated mode.

In summary, the memory requirements are as follows (in bytes):

- WB-roundup4(EPDC\_RES[HORIZONTAL]) x EPDC\_RES[VERTICAL] x 2
- when stride feature not enabled: UPD-N x roundup8(EPDC\_UPD\_SIZE[WIDTH]) x EPDC\_UPD\_SIZE[HEIGHT]
  - N = the number of update requests currently being managed by the i.MX EPD driver (that is, the driver may maintain a list of updates in memory which it uses to feed the EPDC).
- when stride feature enabled: UPD-N x EPDC\_UPD\_STRIDE x EPDC\_UPD\_SIZE[HEIGHT]

### 23.3.4.2 Panel Architecture Configuration

The EPDC is designed to directly drive EPD panels which typically expose the source and gate driver IC interfaces (these are often abstracted in traditional displays such as TFT-LCD).

The source and gate driver ICs are responsible for driving the TFT matrix. There are variations in both the panel architectures and the underlying source and gate driver IC functionality.

All the key configuration parameters are defined in the EDPC\_RES, EPDC\_FORMAT, EPDC\_TCE\_CTRL, EPDC\_TCE\_SDCFG and EPDC\_TCE\_GDCFG registers as follows.

- EPDC\_RES:
  - HORIZONTAL: The panel horizontal resolution (in pixels). The horizontal resolution must be an integer multiple of the source driver PIXELS\_PER\_SDCLK value. It also must be an integer multiple of the PIXELS\_PER\_CE value.
  - VERTICAL: The panel vertical resolution (in pixels). This can be any integer value.
- EPDC\_FORMAT:
  - DEFAULT\_TFT\_PIXEL: This field should almost always be left at 0x00. This register field is used as the value for the TFT pixel during a frame scan when a

pixel is not being updated. This condition is commonplace especially when using partial updates or updates which do not encompass the entire screen resolution.

This value must always correspond to the state the source driver should see when no voltage change is needed. Incorrectly setting this value will damage the EPD material.

- **TFT\_PIXEL\_FORMAT:** This enumerated field defines the width of the TFT pixel. The TFT pixel is defined as the per-pixel voltage control value. The most common pixel format is 2B (2 bits per pixel). Panels which support source driver voltage modulation (multi-level voltage control) should use the 4B format. For source drivers that support 7 levels, the 4B format can be used and the unused DATA output pins should be left floating at the board level connection (specifically DATA3, 7, 11, 15). The 2BV and 4BV are variations which require the waveform data to supply a 2-bit VCOM value for each pixel.
- **EPDC\_TCE\_CTRL:**
  - **SDDO\_WIDTH:** This selects 8- or 16-bit DATA operation using enumerations 8-bit and 16-bit. This field is used to describe useful data for panels that support LVDS. DATA[15:8] would be used to drive differential data. In these modes, SDDO\_WIDTH would be set to 8-bit.
  - **VCOM\_MODE, VCOM\_VAL:** This VCOM\_MODE bit allows the EPDC to either use the VCOM value supplied in the waveform or a software programmable value defined in the VCOM\_VAL field, for panels which support VCOM modulation.
  - **DDR\_MODE:** This mode-bit should be set for panels which expect source-driver data to be available on both edges of the SDCLK. This is common place for panels that support differential signaling, but the feature is not limited to LVDS panels. For example, the EPDC supports DDR modes which make full use of DATA[15:0]. In these modes, DDR\_MODE = 1 and LVDS\_MODE = 0.
  - **LVDS\_MODE:** This mode always requires DDR\_MODE to be set. When this mode bit is set, differential signaling is enabled such that DATA[15:8] always drives the inverse of the pixel data which is presented on DATA[7:0]. Because LVDS source-drivers use 2 pins per data-bit, they are typically configured to work in DDR mode. Differential signaling is also supported on the SDCE pins (as an option selected by LVDS\_MODE\_CE). In this mode SDCE[9:5] are used to drive the inverse differential signals for SDCE[4:0].
  - **LVDS\_MODE\_CE:** When LVDS\_MODE is set, this bit can also be set to allow SDCE[9:5] to act as differential pairs for each SDCE[4:0].
  - **PIXELS\_PER\_SDCLK:** This is a key configuration and timing parameter. Each source driver latches a number of TFT pixels per shift clock period (SDCLK). This register defines how many pixels are driven per SDCLK period. When DDR\_MODE = 1, pixels are driven on both edges of the clock, so this value must be adjusted accordingly. See for the required values per mode.

- EPDC\_TCE\_SDCFG:
  - SDCLK\_HOLD: Holds the SDCLK low during the LINE\_BEGIN time. The purpose of this field is to allow the user to set a LINE\_BEGIN time which is not an integer multiple of SDCLKs (for fine tuning the line-time).
  - SDSHR: Defines the value of the SDSHR output signal which determines the source driver output order mapping.
  - NUM\_CE: Defines the total number of source driver chip-enables (must be 1-10). This number doesn't always correspond to the number of source drivers in the panel. Many panels require only a single chip-enable signal which is active during the entire line data time. This signal is often called SPH (Horizontal Start Pulse) in such cases.
  - PIXELS\_PER\_CE: This register defines the span of each chip-enable expressed in pixels. For panels that utilize a single global CE, this value should be set to the horizontal resolution of the panel.
  - SDDO\_REFORMAT: This enumerated field allows for TFT-pixel level reordering within DATA. For most panels it is recommended to set SDDO\_REFORMAT to the REVERSE\_PIXELS enumeration.
  - SDDO\_INVERT: When this field is set, the values on DATA are inverted relative to the values extracted from the waveform LUT operations.
- EPDC\_TCE\_GDCFG:
  - GDRL: Defines the value of the GDRL output signal which determines the gate driver pulse shift direction.
  - GDOE\_MODE: This field selects between two possible methods for driving the GDOE signal. When GDOE\_MODE = 0, the GDOE output is always driven during the frame scan time, except during FRAME\_SYNC when it is driven low. When GDOE\_MODE = 1, the GDOE signal mimics the GDCLK signal but is only active during the frame-data time (FD). For most panels the recommended setting is 0.
  - GDSP\_MODE: This field selects between two possible methods for driving the GDSP signal. When GDSP\_MODE = 0, the GDSP signal is driven on the first line clock time of the FRAME\_BEGIN time. The signal is driven for one GDCLK period (same as line time), and can be shifted using the GDSP\_OFFSET control. When GDSP\_MODE = 1, GDSP is active during the entire FRAME\_SYNC time, and GDSP\_OFFSET has no effect in this mode.

### 23.3.4.3 TFT Panel Timing Configuration

The EPDC provides a simple primary set of registers to define TFT line and frame (refresh) timing.

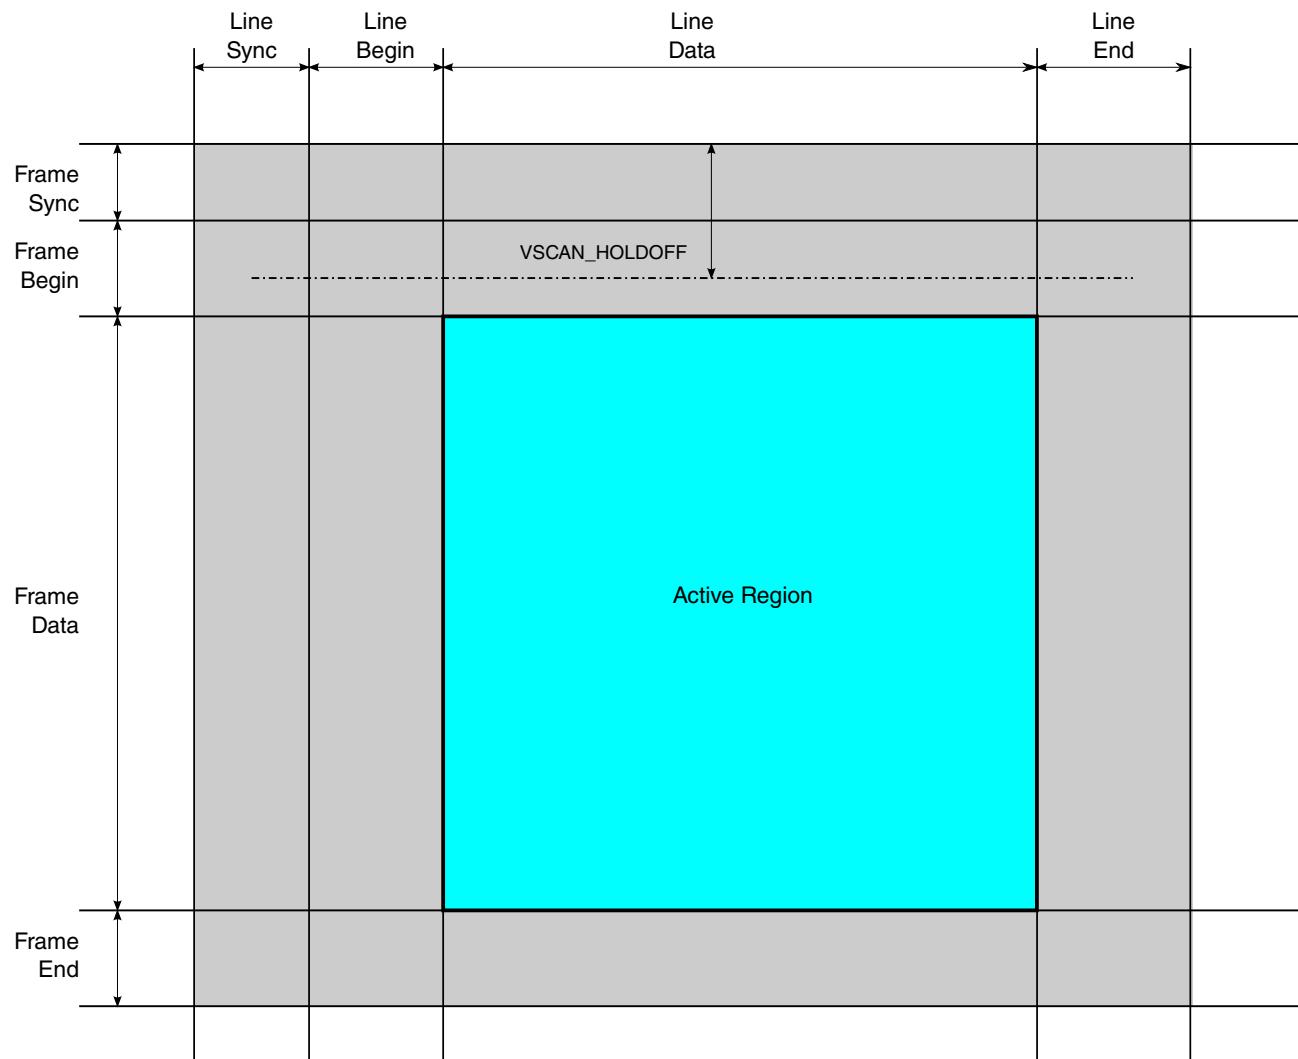

## Programming Model

In addition to these, there are also low-level timing and polarity registers to provide additional flexibility in dealing with future TFT architectures.

The following figure shows how the horizontal and vertical timing is defined in terms of the various timing parameters. When configuring the TFT timing, the following goals should be met:

- Arrive at a refresh rate that matches the waveform requirement (for example, 50 Hz for 50 Hz waveform). The refresh rate is defined as the time between each frame sync event and can be expressed as a multiple of the line timing and the total number of vertical lines.
- Meet the various timing requirements of the gate and source driver clock and control signals (the blanking period provide an infrastructure for controlling these).
- Stay below the maximum source-driver clock (usually referred to as CL) frequency.
- Arrive at a source driver clock frequency which in turn defines the exact pixclk frequency. In most cases, E-INK™ provides the expected SDCLK frequency.
- Meet the line-timing (LT) requirements of the E-INK panels and their associated waveforms.

For proper waveform performance, it is critical to match the refresh frequency to that required by the waveform and associated panel. Deviation from this frequency results in short term inaccuracy of color and in the long term, complete loss of coherency between the EPDC's internal representation of color and the physical representation on the screen.

**Figure 23-2. Frame Timing**

The following equations define the timing of the panel scan frame (where LT = line-timing and FT = frame-timing):

$$LT = TPIXCLK (LS + LB + (HRES \times \left( \frac{\text{Ratio}}{\text{PIXELSPERSDCLK}} \right)) + LE)$$

$$FT = LT \times (FS + FB + VRES + LE)$$

## Programming Model

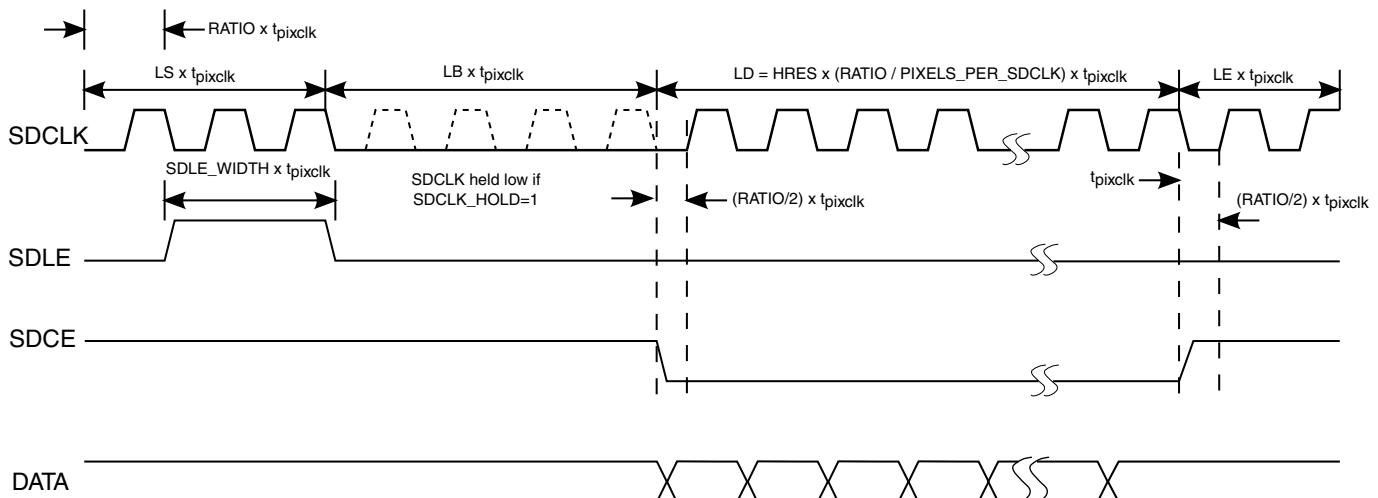

Ratio is defined between the internal PIXCLK and the external source driver clock SDCLK. The ratio is automatically determined by the EPDC according to . A simple method to determine the ratio is as follows:

- When DDR\_MODE = 1, RATIO = 4
- When DDR\_MODE = 0
  - If PIXELS\_PER\_SDCLK = 8, RATIO = 4
  - Else, RATIO = 2

Typically it is recommended to seed these equations with an estimated (or provided) SDCLK frequency and adjust the various timings until the desired refresh rate is attained.

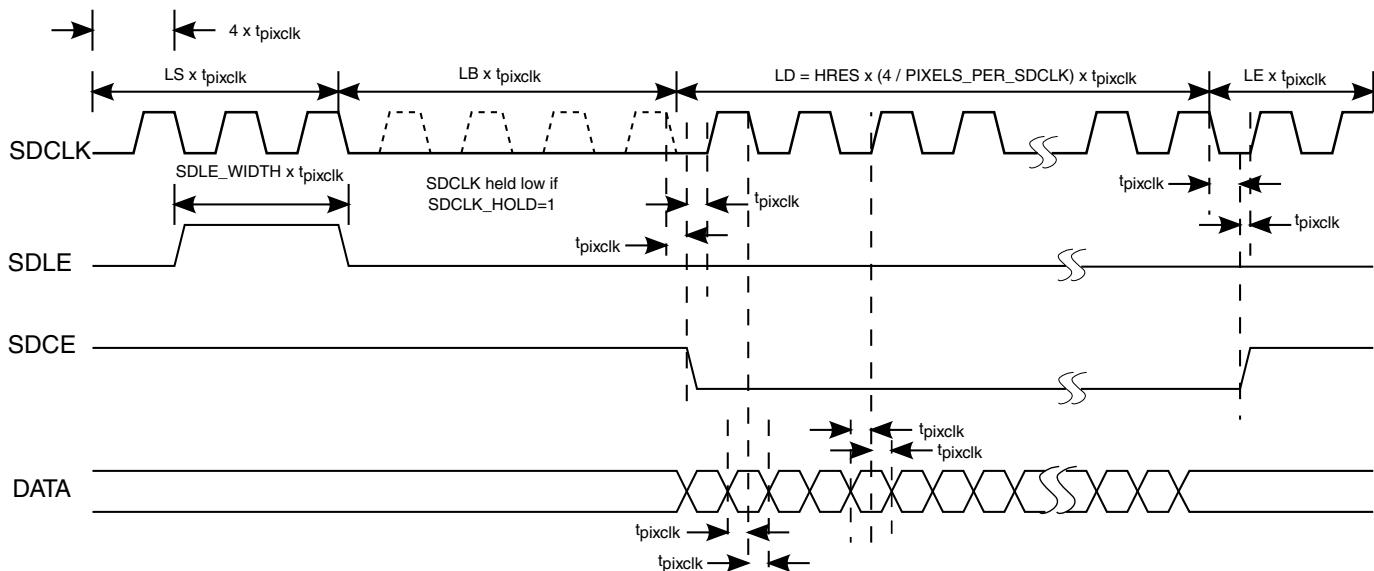

The following figure shows line timing for cases, where DDR\_MODE = 0 (those cases where data is only sampled by the source driver on the rising edge of SDCLK).

Depending on the mode (see ), the ratio is a function of TFT pixel width and PIXELS\_PER\_SDCLK, so the timings are shown generically. For the purposes of this diagram, RATIO can either be 2 or 4.

**Figure 23-3. Line Timing (DDR\_MODE = 0)**

As per , when DDR\_MODE=1 (for example, for source drivers that require data to be driven on each edge of SDCLK), the RATIO is always set to 4. The timing for such cases is shown in the figure below.

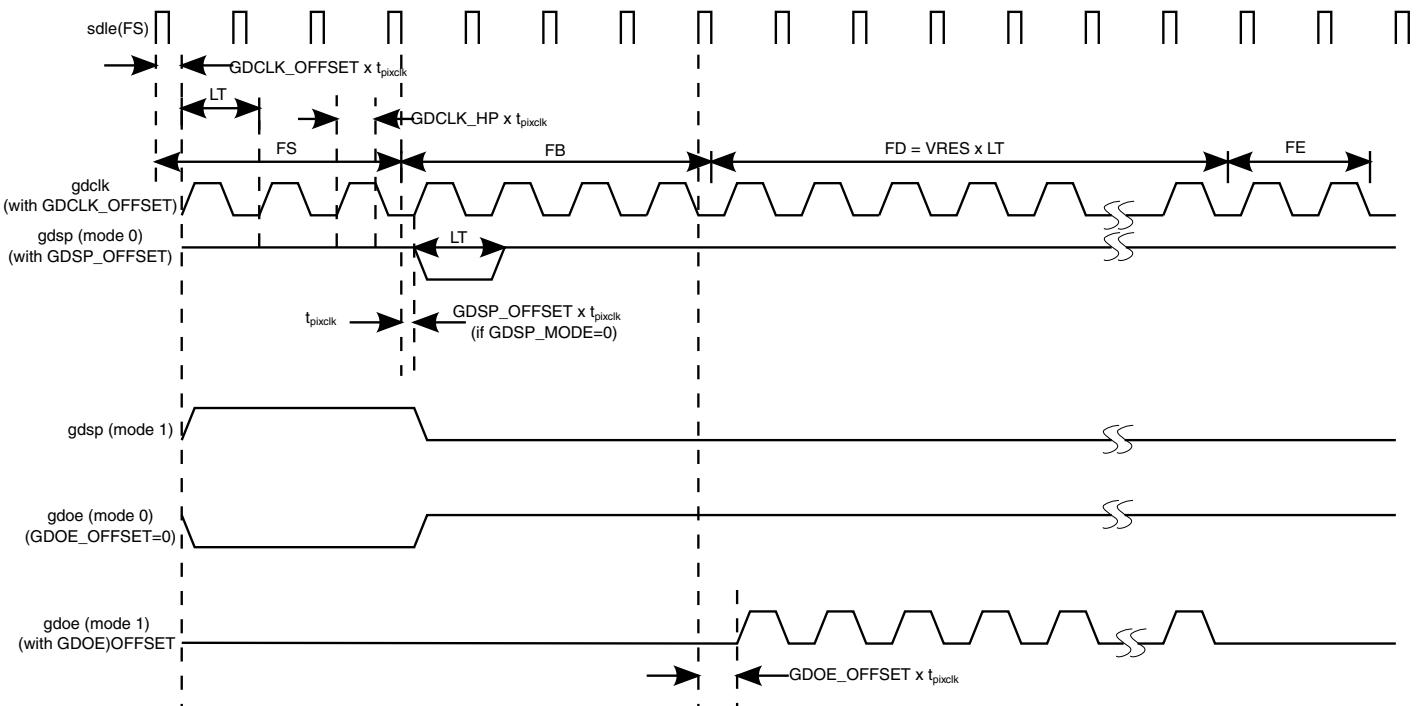

**Figure 23-4. Line Timing (DDR\_MODE = 1) - RATIO = 4**

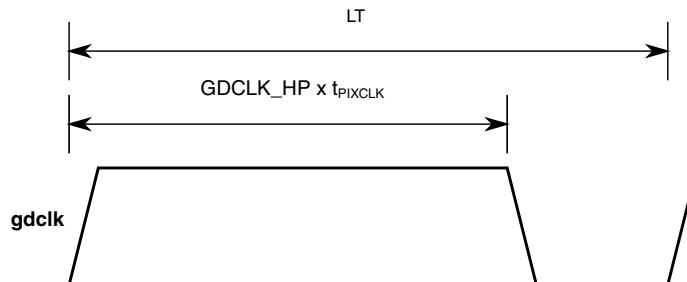

Vertical timing or frame timing (FT) is always expressed in terms of line timing (LT). This is shown in the following figure, followed by a detailed view of the GDCLK timing (which has programmable duty cycle to allow programming of gate-on/gate-off time) in [Figure 23-6](#). The following important points should be noted in regard to gate driver timing:

- All gate driver timing signals are independently referenced to the LINE\_SYNC leading edge (this includes GDCLK\_OFFSET, GDSP\_OFFSET, and GDOE\_OFFSET).
- GDSP\_OFFSET is only supported for GDSP\_MODE = 1
- For GDOE\_MODE = 1, if GDOE is expected to be delayed relative to GDCLK, the GDOE\_OFFSET value should be set at a value appropriately greater than GDCLK\_OFFSET.
- All offset settings are programmed in terms of PIXCLK cycles.
- By default, if all offset values are set to 0, the gate driver signals are always one PIXCLK cycle delayed from the LINE\_SYNC leading edge.
- The LINE\_SYNC leading edge doesn't depend on the LINE\_SYNC\_WIDTH value. In cases where LINE\_SYNC\_WIDTH is set to some value that is less than LINE\_SYNC, a virtual leading edge which determines the line start time still exists.

## Programming Model

**Figure 23-5. Frame Timing (Vertical)**

**Figure 23-6. GDCLK Duty Cycle**

An example calculation based on the 800 x 600 E-INK 6" panel with 50 Hz waveforms is shown below:

- **PIXELS\_PER\_SDCLK = 4**
- Ratio = 2 (2 bpp, 8-bit single-ended, SDR per )
- **tPIXCLK = 17.64 MHz** (assuming available chip clock frequency)
- **LS = 20 x tPIXCLK**
- **LB = 8 x tPIXCLK**
- **LD = 800 x (2/4) x tPIXCLK = 400 x tPIXCLK**
- **LE = 142 x tPIXCLK**
- **LT = (20 + 8 + 400 + 142) x tPIXCLK = 32.31293 uS**

**LINE\_SYNC\_WIDTH** does not affect line timing. It should be set to the same value as **LINE\_SYNC**, unless LB and LE are short and it is used to shorten the width of SDLE whilst still maintaining the same line-timing.

It is important to meet the target line time of the panel which was 32.312 uS. Then the frame-rate can be calculated and given the vertical timings:

- FS = 4 x LT
- FB = 4 x LT
- FD = 600 x LT
- FE = 10 x LT
- FT = (4 + 4 + 600 + 10) x LT = 50.07665 Hz

In addition to this, E-INK panels require a particular duty cycle for the GDCLK signal which is specified as gate-on-time and gate-off-time. The sum of gate-off and gate-on should equal LT and the value of gate-on can be programmed through HW\_EPDC\_TCE\_TIMING2[GDCLK\_HP], or GDCLK High-Pulse time.

### 23.3.4.4 Source Driver and Pixel Clock Configuration

The EPDC supports a number of source driver architectures. Each architecture forces a particular shift clock pixel rate.

In addition to this, the selection of the architecture requires a particular clock ratio between the internal pixel clock (pixclk) and external shift clock EPDC\_SDCLK. The table below outlines the various configurations and clock ratios. It also lists the relevant register settings for this configuration.

**Table 23-1. Interface Modes**

High-Level Mode	EPDC_DATA pins used	HW_EPDC_FORMAT [TFT_PIXEL_FORMAT]	HW_EPDC_TCE_CTRL [PIXELS_PER_SDCLK]	HW_EPDC_TCE_CTRL [LVDS_MODE]	HW_EPDC_TCE_CTRL [DDR_MODE]	HW_EPDC_TCE_CTRL [SDDO_WIDTH]	Required PIXCLK (RATIO)
2bpp, 8-bit single-ended, SDR	[7:0]	2B[V]	FOUR	0	0	8BIT	SDCLK x 2
2bpp, 16-bit single-ended, SDR	[15:0]	2B[V]	EIGHT	0	0	16BIT	SDCLK x 4
2bpp, 8-bit, DDR (LVDS option)	[7:0],[15:8]	2B[V]	EIGHT	1 0	1	8BIT	SDCLK x 4
4bpp, 8-bit single-ended, SDR	[7:0]	4B[V]	TWO	0	0	8BIT	SDCLK x 2
4bpp, 16-bit, single-ended SDR	[15:0]	4B[V]	FOUR	0	0	16BIT	SDCLK x 2

*Table continues on the next page...*

**Table 23-1. Interface Modes (continued)**

High-Level Mode	EPDC_DATA pins used	HW_EPDC_FORMAT	HW_EPDC_TCE_CTRL	HW_EPDC_TCE_CTRL	HW_EPDC_TCE_CTRL	HW_EPDC_TCE_CTRL	Required PIXCLK (RATIO)
	[TFT_PIXEL_FORMAT]	[PIXELS_PER_SDCLK]	[LVDS_MODE]	[DDR_MODE]	[SDDO_WIDTH]		
4bpp, 8-bit, DDR (LVDS option)	[7:0],[15:8]	4B[V]	FOUR	1 0	1	8BIT	SDCLK x 4
4bpp, 16-bit, single-ended, DDR	[15:0]	4B[V]	EIGHT	0	1	16BIT	SDCLK x 4

### 23.3.4.5 Initializing the Display

Because of the nature of the EPD technology, a typical scenario would involve the EPDC's working buffer (WB) being maintained in system memory. In such power states (where memory is maintained), it is not required to initialize the display (even if the EPD panel had been powered off for example).

In low-power modes where system memory is not maintained, there are two possible methods to initialize the display.

The first method includes initialization from an unknown state and the second mode simply requires software to load the last state of the WB into memory and configure the EPDC to point to it.

#### 23.3.4.5.1 Reset/Clocks and Buffer Preparation

In cases in which the user wants to initialize the screen to a new known state, the following sequence should be followed. Assume that all relevant display power supplies are active.

First, the user must complete a soft reset sequence which includes enabling the main EPDC block-level clock gate. This sequence is described in the example code below. Setting SFTRST enables the CLKGATE. In order to correctly cycle reset values through pipeline registers, the CLKGATE bit stays asserted for some finite amount of time before it sets. After this time, it is safe to clear both the SFTRST and CLKGATE. The example below shows a typical use of these registers.

```
EPDC_CTRL_SET(BM_EPDC_CTRL_SFTRST);
while (!EPDC_CTRL.B.CLKGATE);
EPDC_CTRL_CLR(BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE);
while (EPDC_CTRL_RD() & (BM_EPDC_CTRL_SFTRST | BM_EPDC_CTRL_CLKGATE));
```

Before any display update is performed, the waveform address and working buffer (WB) pointers must be set (both must be aligned to a 64-bit double long word address):

- EPDC\_WVADDR: Must point to the base address of the waveform data (managed by the i.MX driver)
- EPDC\_WB\_ADDR: An area of memory must be assigned for the EPDC's working buffer (WB). Once assigned, this memory space should be reserved purely for the use of the EPDC. The requirements for the memory allocation are described in [Memory Requirements](#).

After this, the various panel configuration parameters must be set including resolutions, source and gate driver formats, TFT and buffer pixel formats.

### 23.3.4.5.2 Performing an Initialization Display Update

Once all the panel timing and format parameters are defined, a command sequence must be sent to the EPDC with the properties found here.

- Update size must be full screen resolution
- HW\_EPDC\_UPD\_CTRL[UPDATE\_MODE] must be set to FULL
- HW\_EPDC\_UPD\_CTRL[WAVEFORM\_MODE] must be set to the INIT waveform (typically 0x00)
- HW\_EPDC\_UPD\_CTRL[USE\_FIXED] must be set
- HW\_EPDC\_UPD\_FIXED[FIXNP\_EN], FIXCP\_EN must be set to 1, and FIXNP and FIXCP must be set to 0xFF

The use of HW\_EPDC\_UPD\_FIXED allows the EPDC working buffer to be primed to a state that matches the result of the initialization waveform.

If the application loads the previous WB of the EPDC, these steps are not necessary.

## 23.3.5 Update Buffer Analysis Functions

EPDC can perform several analyses on the update buffer.

The information collected during processing will be reported to the register after update buffer processing is complete.

- Collision Rectangle Detection

For a collided update buffer, this function will report a minimal rectangle that can cover all collided pixels.

When a collision occurs, it's possible that not all, but only part of that update buffer generate a collision, so only the pixels inside a minimal collision rectangle need to be re-submited.

Details of minimal collision rectangle reported in UPD\_COL\_CORD/ UPD\_COL\_SIZE.

- **Grey Level Detection (histogram)**

This function reports the minimal grey level that covers all pixels and which must be updated. This histogram differs from that of PXP; here we ignore those pixels which need no update, while the PXP histogram is calculated on the whole update buffer. The histogram feature is capable of reporting a histogram for 1, 2, 4, 8, or 16 grey levels. The valid grey levels value should be programmed into the HIST(1/2/4/8/16)\_PARAM registers before using this functionality.

- **Dry-Run Mode**

Dry-Run mode allows the user to run an update for the purpose of obtaining information without performing any real action. This mode is enabled by setting UPD\_CTRL[DRY\_RUN] = 1 when writing UPD\_CTRL register .

In this mode, Update Buffer will be read and checked against the current Working Buffer. As with a normal update, an interrupt will be generated when the Working Buffer processing completes.

Several pieces of information about the update can then be acquired from the EPDC registers: whether a collision occurred, the minimal collision area, and histogram data.. However, the result (Next Pixel, LUT info) will not be written back into the Working Buffer for further panel scan operation, nor will the LUT waveform be loaded.

The LUT resource specified by UPD\_CTRL[LUT\_SEL] is not used here; the user can start this dry-run update when no LUTs are available.

### **23.3.6 Waveform Mode Selection (AUTOWV)**

This function is provided to support waveform selection based on the grey level (histogram) information collected during the update buffer processing stage.

Then AUTOWV LUT is provided to hold a mapping between the grey level of NP(pixel value from update buffer) and optimal waveform mode. This LUT mapping should be programmed before using this function by writing into the AUTOWV\_LUT register with AUTOWV\_LUT[ADDR] = "grey level", AUTOWV\_LUT[DATA] = "waveform mode" for each possible grey level reported by the EPDC histogram.

After AUTOWV\_LUT is programmed, AUTOWV mode can be enabled by setting UPD\_CTRL[AUTOWV]=1. When enabling AUTOWV, the waveform mode written into UPD\_CTRL[WAVEFORM\_MODE] will be ignored and the loading waveform will initially be put on hold.

After the Update Buffer processing completes, EPDC reports the minimal grey level, retrieves the mapped waveform mode from AUTOWV LUT, and writes it back into UPD\_CTRL[WAVEFORM\_MODE].

If the user also sets UPD\_CTRL[DRY\_RUN], EPDC will be finished at this point.

Otherwise, EPDC continues with the following, depending upon the UPD\_CTRL[AUTOWV\_PAUSE] setting:

1. UPD\_CTRL[AUTOWV\_PAUSE] = 0, AUTO MODE)

EPDC will begin waveform loading immediately without any software interaction

2. UPD\_CTRL[AUTOWV\_PAUSE] = 1, MANUAL MODE)

EPDC waits for software to decide whether the selected waveform is ok, then if necessary software can use some other criteria to select a waveform mode. After software selects the waveform mode, it writes again into UPD\_CTRL with final waveform mode, and waveform loading then panel scan will start.

### **NOTE**

AUTOWV\_PAUSE is extended for general use so that it can be used independent of AUTOWV feature. Regardless of whether AUTOWV is enabled or not, the user can send updates with AUTOWV\_PAUSE=1. EPDC will stop after WB processing and pause before LUT loading and panel scan. Software can explicitly do that latter by writing to UPD\_CTRL with AUTOWV\_PAUSE=0. EPDC will ignore the Update Buffer for this time, and kick off the LUT loading and panel scanning. This feature allows SW modification to the working buffer after EPDC hardware has finished processing it.

### 23.3.7 Panel Interface Generator (Pigeon Mode)

There are seventeen panel interface signal outputs (DATA/SDCLK not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode".

Pigeon Mode is a timing mode which can be independently enabled on any of the seventeen timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable.

The following are the legacy timing signals which support pigeon mode:

- PIGEON[00] - SDCE0
- PIGEON[01] - SDCE1
- PIGEON[02] - SDCE2
- PIGEON[03] - SDCE3
- PIGEON[04] - SDCE4

#### Working Theory

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)
2. Increment on event selected through INC\_SEL
3. Count and match SET\_CNT: assert signal, reset counter  
(SET\_CNT==0 means assert immediately on MASK's rising edge)
4. Count and match CLR\_CNT: de-assert signal, stop counter  
(CLR\_CNT==0 means de-assert on MASK's falling edge)

**NOTE**

When local counter is running, further changes to MASK are not cared unless CLR\_CNT==0

MASK - start point for local counter

Created using any combination of below options (ANDed)

1. STATE\_MASK = (FS|FB|FD|FE) AND (LS|LB|LD|LE)

8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

For example, for a line timing signal start on Line Begin phase during Frame Begin/Frame Data lines, use the configuration below:

**Table 23-2. STATE\_MASK combinations**

STATE_MASK	LS	LB =1	LD	LE
FS				
FB =1		X		
FD =1		X		
FE				

2. MASK\_CNT/MASK\_CNT\_SEL(global counter)

Sometimes a more accurate reference point is required, such as "line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK\_CNT\_SEL, when global counter matches the MASK\_CNT value. The pigeon local counter will start ticking.

3. Use another pigeon signal as mask (SIG\_LOGIC=MASK)

For some tightly coupled signals it is possible to use one as a reference to generate another.

INC\_SEL- select local counter tick event

1. pclk - pixel clk
2. line - line start pulse
3. frame - frame start pulse
4. another - another pigeon signal

OFFSET- offset on pclk basis

## Programming Model

Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set OFFSET to a negative value to achieve this.

Global Counters (selectable through MASK\_CNT\_SEL)

- HCNT / VCNT

normal pclk counter / line counter

- HSTATE\_CNT / VSTATE\_CNT

similar to above, but reset when state changes

- HSTATE\_CYCLE / VSTATE\_CYCLE

(see figure below for definition of CYCLE/PERIOD/CNT)

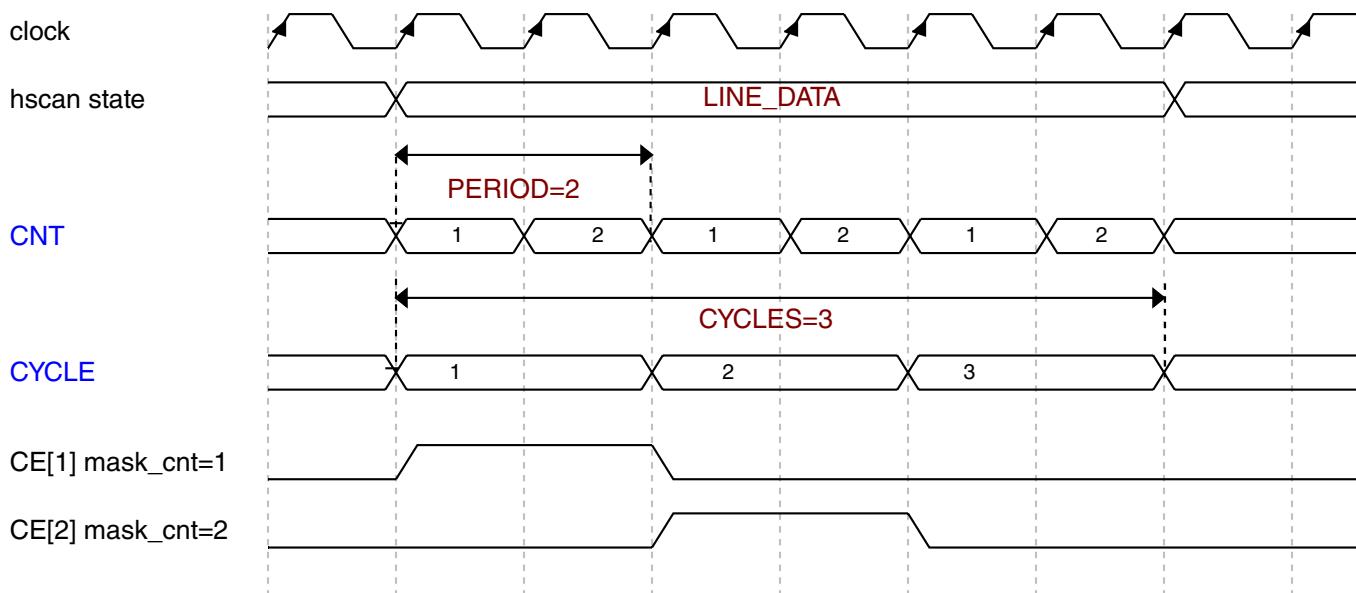

Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as CE[n] are only valid during part n of Line Data. For such signals, use

HW\_EPDC\_PIGEON\_CTRL.\*\_PERIOD to specify PERIOD where CNT is reset and CYCLE is included. Then the user can select CYCLE as MASK\_CNT to generate mask for CE[n].

- FRAME\_CNT / FRAME\_CYCLE (only for frame-crossing signals)

frame cycle counter doesn't have a reset condition; use

HW\_EPDC\_PIGEON\_CTRL1.FRAME\_CNT\_CYCLES to reset it.

**Figure 23-7. Definition of CNT, CYCLE, PERIOD**

The following are register settings for the figure above:

- HW\_EPDC\_PIGEON\_CTRL0.LD\_PERIOD=2
- MASK\_CNT\_SEL = 1 // HSTATE\_CYCLE
- MASK\_CNT = 1 // CE[1]
- MASK\_CNT = 2 // CE[2]

### 23.3.8 Display Update Programming

The EPDC is designed to communicate with the kernel driver through the interrupts and status registers.

The driver entry is always assumed to occur as a result of an interrupt.

#### 23.3.8.1 Initiating a Display Update

The typical flow for performing a display update involves the following:

- EPDC\_STATUS[WB\_BUSY] must be 0. The EPDC cannot process new updates if it is currently processing an update.
- EPDC\_STATUS[LUTS\_BUSY] must be 0. The EPDC cannot accept new updates if all LUT resources are currently active.

Assuming both conditions above are met, an update request is programmed in the following manner (it is important to note that the last step must be writing to EPDC\_UPD\_CTRL which initiates the display update).

The following steps can be performed before WB\_BUSY and LUTS\_BUSY are clear:

- At this time it is assumed that the correct temperature is selected and written to EPDC\_TEMP.
- EPDC\_UPD\_ADDR must be set to the 8-bit buffer for the update **if stride feature not enabled (when enabled stride feature, no requirement on align)**. This buffer must be aligned to a 64-bit word address. In addition, each line address must begin at a 64-bit word address. Both criteria can be met by utilizing the PXP pixel processing engine which always aligns lines at a 64-bit raster (see [Memory Requirements](#) for details).
- EPDC\_UPD\_CORD defines the insertion co-ordinate into the panel resolution.
- EPDC\_UPD\_SIZE defines the dimension of the update (pixels).
- EPDC\_UPD\_FIXED is used for panel initialization or rectangular fill operations.

Writing the EPDC\_UPD\_CTRL register initiates a display update:

- USE\_FIXED-This field is set when EPDC\_UPD\_FIXED is used.
- LUT\_SEL-The driver should read EPDC\_STATUS\_NEXLUT[NEXT\_LUT] (qualified by NEXT\_LUT\_VALID) to select an available LUT to assign this update.
- WAVEFORM\_MODE selects the E-INK waveform mode (for example, INIT, DU, GC16 and so on). The number corresponds to the waveform number in the waveform specification document.
- UPDATE\_MODE selects one of two enumerated updated modes.
  - FULL-In this mode, all pixels defined in the update rectangle have the waveform applied.
  - PARTIAL-In this mode, the EPDC shall only apply the waveform to pixels which are changing, otherwise the EPDC\_FORMAT[DEFAULT\_TFT\_PIXEL] is applied to the pixels which are not changing.

### 23.3.8.2 Update Processing and Collisions

After the update is initiated (by writing EPDC\_UPD\_CTRL), the EPDC performs update-buffer processing. This involves processing this update region into its working buffer (WB).

During this time, the EPDC also performs collision detection. At the end of the WB processing, the EPDC asserts the WB\_CMPLT\_IRQ interrupt. If a collision is detected, the LUT\_COL\_IRQ interrupt status bit will also be asserted.

The EPDC performs image updates to the EPD by applying waveforms to individual pixels. Waveforms are applied to groups of pixels (ranging from a single pixel to the entire display). Each individual update request is bound to a rectangle. Each pixel within this rectangle has a waveform applied to it using the waveform and update mode specified in EPDC\_UPD\_CTRL. After this process is initiated, a waveform takes an amount of time to complete which is usually determined by the specifications of the waveform mode. For proper display operation and optimum performance, a waveform must not be interrupted once it has begun.

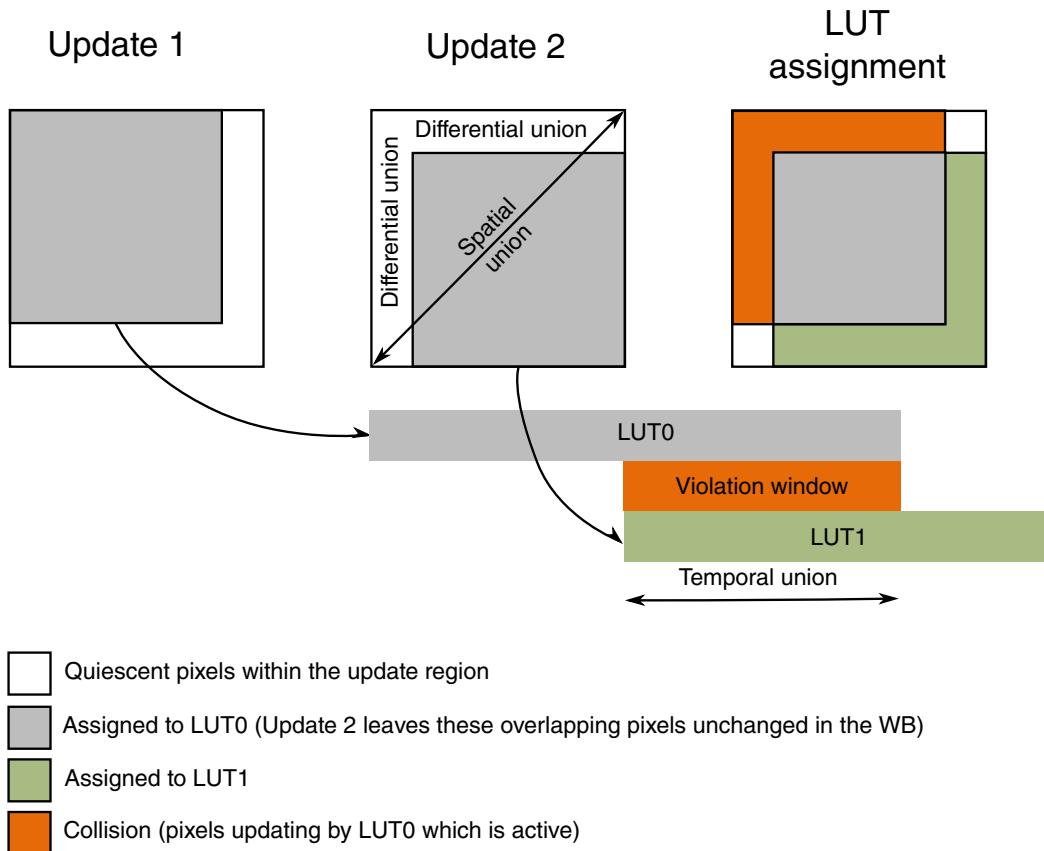

A collision is defined simply as the interruption of the application of waveform to a pixel or group of pixels. As such, it must be avoided. Because the waveforms take a finite amount of time to complete, the EPDC provides a mechanism to automatically manage collisions, which allows the application to perform multiple updates resulting in a richer user experience without having to be cognizant of the panel and waveform characteristics.

Depending on the update mode (FULL or PARTIAL) a collision is defined as follows:

- For a full-update mode, a collision is defined as the temporal and spatial union of rectangles pertaining to active unique update requests. An active update is one which is still in the process of being updated (that is, a waveform is being applied).
- For a partial-update mode, a collision is defined as the temporal, spatial and differential union of pixels pertaining to unique update requests which are active. The difference between a full-updated and a partial-updated collision is that in the latter case, the collision state occurs only if the next-pixel states differ between the updates. Thus, two partial-update rectangles may intersect, but if all of the pixels in the intersecting update regions are being updated to the same gray-state, the original update and associated LUT/waveform are not disturbed and the intersection does not constitute a collision.
- It should be noted that collisions may be a one-to-many effect. In the case of partial updates, there may be a spatial and temporal union of rectangles with no differential pixel-level union. A subsequent update however might form such a pixel-level differential union to all active updates. Since each update pertains to an active LUT, these many collided updates are referred to as victim LUTs. The update/LUT that caused the collision is referred to as the aggressor LUT.

An example of a partial-update mode collision is shown in the following figure. Each update encompasses the outer rectangle which meets the criteria of the spatial union. The red areas show the pixels which are currently transitioning to gray (from update 1) but need to transition to white (in update 2). These pixels meet the criteria of the differential union and lastly in the temporal domain, the period of time where LUT0 and LUT1 overlap is the temporal union. The pixels that did not change (grey and green areas in the LUT assignment box) are not part of the collision area. In the case of the gray

overlapping pixels, LUT0 can continue to update. In the case of the white pixels (which were previously inactive) a new LUT (if available can be assigned) and forms the green region. Note that a subsequent update could potentially collide with the green pixels in update 2.

**Figure 23-8. Partial Update Collision Handling**

### NOTE

For FULL update modes, a collision occurs at any intersection of active rectangles/LUTs because in FULL update mode, all pixels within the update rectangle have the waveform applied (even if pixel values are not changing).

It can be seen that when collision is detected (during the WB update process), the EPDC will "block" the collided pixels being updated, and any pixels which are not collided will be assigned to the requested LUT process. When a collision occurs, the EPDC will raise the LUT\_COL\_IRQ interrupt status bit (this will always happen in conjunction with WB\_CMPLT\_IRQ).

Because the driver is always entered via an interrupt, when the EPDC interrupt fires, driver should not only check for WB\_CMPLT\_IRQ but also for the LUT\_COL\_IRQ status bit within the EPDC\_IRQ register. If LUT\_COL\_IRQ is set, this means that a

collision has occurred. If this is the case the driver should check the value of the EPDC\_STATUS\_COL register. This register contains one bit for each LUT that has been collided with, that is, it holds the vector of the victim LUTs as a result of the last update LUT. Since the driver knows the value of the LUT of the last update, it can store this update LUT value along with this associated victim LUT vector in a collision list.

Because the EPDC can drive up to 16 concurrent updates (which can be overlapping when using PARTIAL mode updates), a unique interrupt status bit is provided per LUT so that when an update completes (physically completes the waveform), the SW driver can know which LUT completed. In addition to the LUT completion interrupts (which are mapped into the EPDC\_IRQ[LUTn\_CMPLT IRQ] interrupt status bits), the current state of each LUT can also be read from the EPDC\_STATUS\_LUTS status register.

The driver can use the LUT status interrupts in conjunction with EPDC\_STATUS\_LUTS to perform regular checks on the completion of victim LUTs against the vectors stored for each colliding LUT in the collision list. The driver may also choose to serialize updates such that it might wait until all victim LUTs have completed before re-issuing the colliding update.

The figure below shows a more extended sequence of a collision. In this case there are a series of updates coming from the application layer. They are A, B, C and D. Updates A, B, and C are set without any collision. When update D is requested a collision is detected. Using the interrupt status collision registers, the SW-driver stores D in a collision-list. For that list entry it also store B which is the victim LUT. It uses this information to check when a LUT completes to see if the victim LUTs for any update in the collision list have completed. If they have completed (through a LUT completion interrupt), the SW-driver then sends this update (D in this case) again to the EPDC. It should be noted that from the application perspective it appears that all updates A, B, C and D have been accepted, that is, the collision handling is completely hidden from user-space. Using the collision detection and LUT status interrupts, the application (in conjunction with the driver) could also choose to completely serialize the requests (such that between the first and second D update, no other update is accepted).

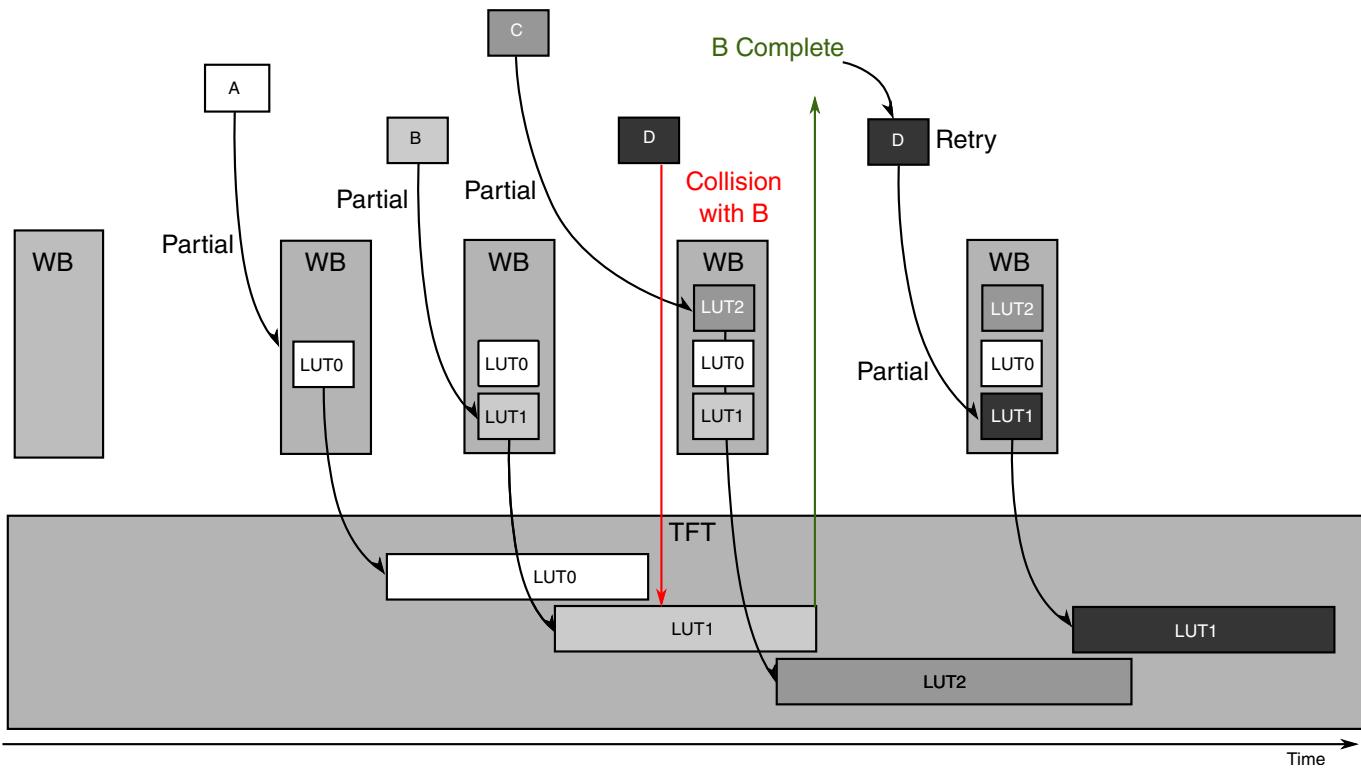

Figure 23-9. Collision Sequence

### 23.3.8.3 Multiple Update Flow

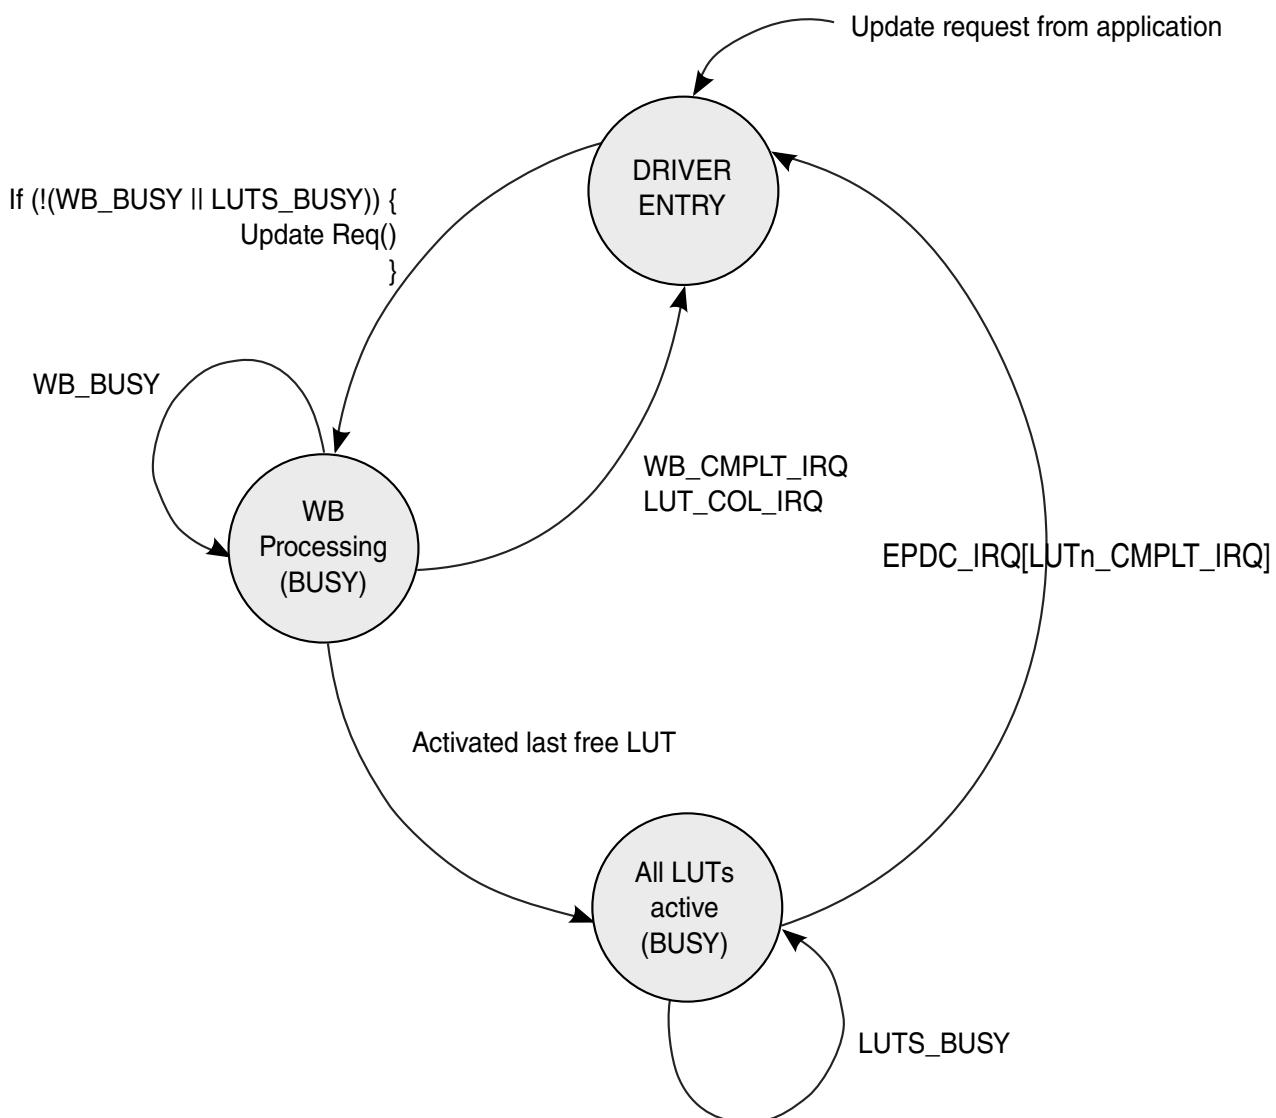

In most applications, such as e-book readers, besides full-screen page turns, user interfaces require multiple updates to be performed.

Examples of this include cursors, pen input, drop-down menus (with highlighting) and other movable graphical objects. Each update takes such a limited amount of time to complete (up to 1 second depending on the waveform mode) that it would be too prohibitive to only process updates serially.

As described in [Initiating a Display Update](#), there are two conditions that must be met before the SW driver can issue a new update request:

- The Working buffer (WB) update process must be complete.
- There must be an available LUT.

Assuming a free LUT is available, the EPDC is designed to have the capability to start new updates at each TFT frame scan (even being able to commence multiple updates within a frame scan blanking period). The general flow for sequential updates (concurrent or serialized) is shown in the following figure.

**Figure 23-10. Driver Update Flow**

This flow assumes that the driver is entered via interrupts. The two busy states are shown to illustrate the conditions under which the driver will not issue new updates. In general, the driver should be throttled by the **WB\_CMPLT\_IRQ** interrupt. Because the EPDC can support up to 64 concurrent updates, it is possible to re-enter the update-request (show as **Update\_Req()** in the figure above) any-time that the WB is not busy (even though LUTs are active and the display is being updated). It is possible that when there are 63 LUTs currently active and a new update is sent, there will be a **WB\_CMPLT\_IRQ** interrupt issued, but the driver at that time would be in a busy state (because **LUTS\_BUSY** is signaled). The driver will be re-entered on the next **LUTn\_CMPLT\_IRQ** interrupt during which time it can issue a new update (since **WB\_BUSY** and **LUTS\_BUSY** status bits are low).

## Programming Model

The update-processing process (which is controlled by the MBM module) is asynchronous to the actual TFT refresh operations (which carry out the physical screen updates), so there is no particular relationship between the WB\_BUSY status and the state of the screen update. In contrast, the LUTn\_CMPLT\_IRQ interrupt status and EPDC\_STATUS\_LUTS provide the status of the physical waveform update. This means that when LUTn\_CMPLT\_IRQ interrupt fires, it means that the last physical TFT frame scan just completed for that update/LUT.

The EPDC implements proprietary methods to efficiently process the WB such that the WB processing time (the time from the SW driver writing EPDC\_UPD\_CTRL to EPDC\_IRQ[WB\_CMPLT\_IRQ] fires), is dependent on the size of the update rectangle. This allows smaller updates to be processed faster. In most EPD applications, this is ideal because it's typically smaller sprites that require the fastest performance. In addition, the EPDC implements methods to allow store pending updates and activate them on the next available frame-scan. For example, if the TFT scanning is currently in the active region and during this time a series of small update requests are sent, the EPDC can begin all of those updates on the next available blanking period.

The figure below shows an example of two larger update requests, one to LUT4 and one to LUT5. These update requests are shown in the context of active LUTs and thus active frame scan times. The time when both WB\_BUSY and LUT\_BUSY is high are defined as "blocking" because no new updates can be accepted. It should also be noted that new updates are physically commenced by the EPDC on blanking periods. From a SW programming model perspective, the EPDC\_STATUS\_LUTS[LUTn\_STATUS] is activated immediately upon the update request being written to the EPDC. The physical frame-scanning for this particular update does not begin until the next available frame scan.

It should be noted that updates and WB processing can actually occur during the blanking period (or can begin in the active scan time and continue into the blanking period). For this reason, the EPDC provides some tuning controls via EPDC\_TCE\_CTRL[VSCAN\_HOLDOFF] such that more time can be given to finish processing update request and less time "locking down" the set of LUTs that will be activated for the upcoming active scan. The EPDC will start to pre-fill its refresh pixel FIFOs after the VSCAN\_HOLDOFF period. Its possible to tune this value to allow the minimum time for the pixel FIFO pre-fill operation (making sure that refresh under-runs do not occur). If a pixel-FIFO under-run occurs, EPDC\_IRQ[TCE\_UNDERRUN\_IRQ] will fire.

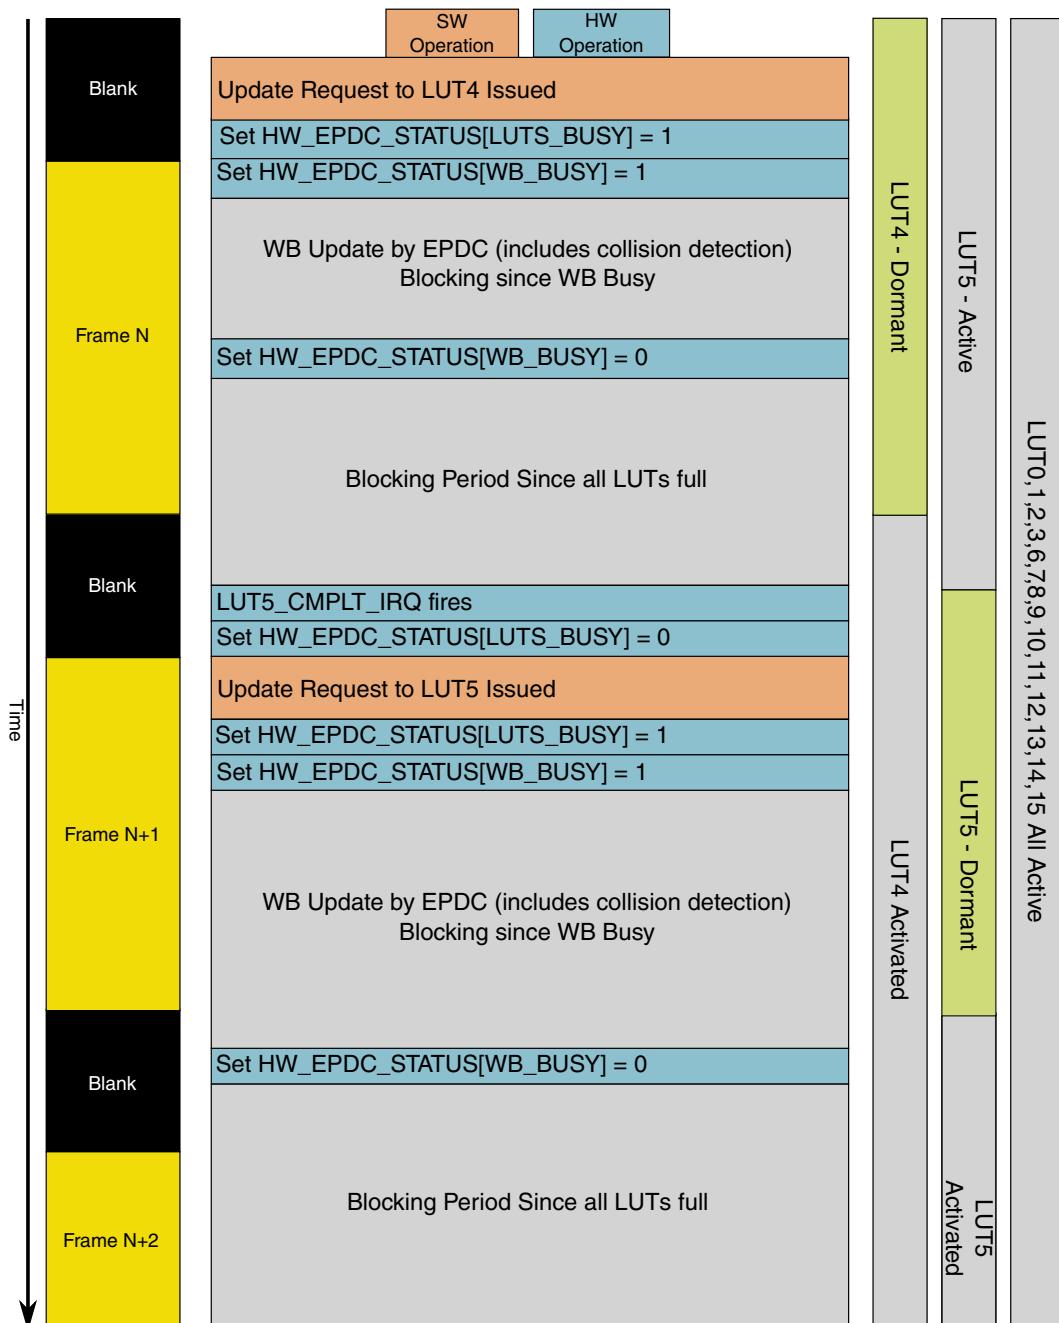

Figure 23-11. Temporal Flow of Update Processing

### 23.3.9 Architectural Clock Gating (Low Power Mode)

As with most modern IP, the EPDC contains low-level hardware controlled automatic clock gating throughout the design.

These clock gating elements typically gate clocks locally for individual or groups of sequential elements (flip flops) when these registers are not currently active.

This tier of clock gating is useful for reducing power during active operation of the EPDC.

Most e-paper applications utilizing EPDs involve the processor and display controller to be a low-power inactive state in most of the time. This is because EPDs only require refresh operations when the display content is being updated. As such, in between update operations, the EPDC provides a module level clock-gating feature that can be controlled by the SW driver as part of a higher-level power management solution.

The EPDC module can have all its clocks completely gated-off by the setting of EPDC\_CTRL[CLKGATE]. There are a couple of considerations that the SW driver must adhere to before placing the EPDC into this low power state:

- All active LUTs (updates) must complete
- Any TFT operations must be complete (including any final blanking operations)

In order to maximize display update frequency (the ability accept new updates during each frame scan), the LUT completion interrupts fire on the end of the last frame's active scan period for that update. This means that the TCE still must compete the final FRAME\_END blanking time to guarantee coherency of its state machines with the panel state (receiving the final LUT completion IRQ is not enough to determine that the EPDC can have all of its clocks shut down). Based on this, the EPDC provides the necessary interrupt and status bits to allow the driver to correctly perform the clock-gating operation by using the following method:

- Once the final EPDC\_IRQ[LUTn\_CMPLT\_IRQ] is reached, the driver should enable the TCE\_IDLE interrupt mask bit via EPDC\_IRQ\_MASK[TCE\_IDLE\_IRQ\_EN], unmask other interrupts and return.
- Once the final blanking time of the last LUT (FRAME\_END time) is completed and the TCE reaches its idle state, the EPDC will assert the EPDC\_IRQ[TCE\_IDLE\_IRQ] interrupt which will cause the driver to re-enter. At this point, the SW knows that the EPDC is in a completely idle state and can perform a set on EPDC\_CTRL[CLKGATE].

Alternative implementations of the driver could simply involve polling for the EPDC\_IRQ[TCE\_IDLE\_IRQ] interrupt status bit (which operates regardless of the interrupt being masked or not) before setting the clock gate (this prevents two iterations of interrupt based driver-entry, but requires a wait loop in the interrupt handler which might be undesirable).

It should be noted that the time interval between the last LUTs LUTn\_CMPLT\_IRQ time and TCE\_IDLE\_IRQ interrupt is equal to the FRAME\_END time.

When the application is ready to send more updates, the driver can immediately re-enable the EPDC by un-gating the module-level clock by clearing the EPDC\_CTRL[CLKGATE] field. This un-gating of the clock is instant and the driver is free to immediately send update requests.

### 23.3.10 Performance Tuning and Considerations

The EPDC is designed to meet the performance requirements of the most demanding e-paper applications. These performance targets must be met in the context of highly integrated SoCs.

In such a context, system memory is typically shared across multiple masters including the Arm platform. Because of this, there is no guarantee of latency from system memory. EPDC provides a number of mechanisms to deal with this as well as some ability to tune various parameters allowing the user to trade-off between update processing performance and refresh functionality.

#### 23.3.10.1 Memory and Bus Bandwidth Requirements

The EPDC MBM module contains up to 6 internal AXI requesting functions (5 read and 1 write). These are arbitrated internally before being sent to the SoC memory system.

The EPDC interfaces to the SoC bus system via a dual-channel 64-bit AXI bus master port. The following table shows the various internal requesters and their properties. Note that there are two round-robin (RR) loops. Because there is only one write source, and the EPDC supports dual-channel AXI, there is no arbitration on the WB write operations.

**Table 23-3. EPDC Bus Requestor Profiles**

Operation	Priority	Burst Length (x8 Bytes)	Maximum Outstanding Transactions	FIFO size
Waveform LUT read	0	8	2	16x68
WB pixel read FIFO0 (refresh)	RR 1	8 or 16	8	256x64
WB pixel read FIFO1 (refresh)	RR 1	8 or 16	8	256x64
WB read for update processing	RR 2	8	2	16x64
WB write for update processing	N/A	8	2	16x64
UPD read for update processing	RR 2	8	2	16x64

As described in [Memory Requirements](#), it can be seen that all lines in a buffer are padded to the nearest 8 byte boundary. This is important to be noted for the bandwidth calculations. The maximum bandwidth scenario involves processing a full-screen update

while performing refresh operations, but refresh operations always have the highest priority. Based on this, the memory bandwidth required by the EPDC is a function of the refresh pixel rate which in turn is a function of resolution, frame-rate and blanking/active time.

The refresh bandwidth can be calculated as follows:

Active Time = Active time of the frame-scan time as a fraction (for example, 0.8)

Frame Rate = TFT frame refresh rate (Hz) (for example, 106 Hz)

Bandwidth (MB/s) = roundup4(EPDC\_RES[HORIZONTAL]) x EPDC\_RES[VERTICAL] x Frame Rate x (1/Active Time) x 2 x(1/1024<sup>2</sup>)

For example, a panel with resolution 2048 x 1536 with 106 Hz refresh and estimated 80% active time, 20% blanking time, the refresh bandwidth is:

BW (MB/S) = 2048 x1536 x 106 x (1/0.8) x 2 x (1/1024<sup>2</sup>) = 795 MB/s

(Note that 2048 mod 4 = 0.)

The WB requires 2 bytes per pixel.

Remaining bandwidth is used for other operations. Because update processing operations are not real-time (they do not necessarily have to occur at the refresh frame-rate), the time required to perform the update can be calculated as a function of the available bandwidth (actual bandwidth minus refresh bandwidth) and the update size.

### **23.3.10.2 Pixel Latency FIFO**

The EPDC contains one working buffer latency FIFO which is used to load working buffer pixel data which is used by the TCE to perform the panel refresh operations.

The FIFO is sized at 1024 pixels each in order to provide significant system memory latency tolerance. The pixel FIFO is dedicated for the main screen.

Under no circumstance should the EPDC pixel FIFO reach an under-run condition. The EPDC provides an interrupt status bit to flag such a condition (TCE\_UNDERRUN\_IRQ). During development, this interrupt must be enabled. The pixel values stored in the FIFO are used by the TCE to perform look-up operations (from the LUTs) to generate TFT voltage control pixels. If an under-run occurs, the result will be unknown data being used as the source for the look-ups, which can damage the panel.

### 23.3.10.3 Basic Watermarking Control

The EPDC provides a basic pixel pre-fetching control mechanism that is applied to the beginning of a new update (from an idle state). This control is provided by EPDC\_FIFOCTRL[FIFO\_INIT\_LEVEL].

The control allows the value to be set between 0-255, with a reset value of 128. Because the internal width of the FIFO holds 4-pixels per entry, the actual number of pixels is (FIFO\_INIT\_LEVEL+1) x 4.

The EPDC uses this value to pre-fill the pixel latency FIFO(s) to this level before the TCE commences the refresh operations which drive the update to the panel. This control has no effect on the FIFO(s) when the EPDC is performing sequential frame-scans.

It must be noted that this value must be set less than (EPDC\_RES[VERTICAL] x EPDC\_RE[HORIZONTAL]) /4.

### 23.3.10.4 Update/Refresh Tuning (VSCAN\_HOLDOFF)

During active frame-scan time, the EPDC provides the ability to process and display new update requests, because all pixels in the WB pertaining to a particular update are bound to a single LUT.

Until all pixels pertaining to that update have been processed in the WB, its LUT cannot be activated. As shown in [Figure 23-11](#), the blanking period provides time to pre-load the pixel FIFOs and for completing WB processing updates and loading the associated frame of waveform data into LUT memories.

The EPDC\_TCE\_CTRL[VSCAN\_HOLDOFF] control field allows control over the vertical blanking period allotment for working buffer processing and pre-loading of the pixel FIFO. The time window defined by VSCAN\_HOLDOFF is allotted for working-buffer processing and LUT loading (of newly processed updates). The remainder of the time is allotted for pre-filling the pixel FIFO.

Note that aggressive use of VSCAN\_HOLDOFF can result in pixel FIFO under-run as the FIFO pre-fill time is compromised.

### 23.3.10.5 System-Level Arbitration Control

As previously mentioned, the TCE refresh operation is time critical.

Because the EPDC is designed to be integrated into a multimaster SoC, system memory is shared between multiple requesters in the system.

## Programming Model

The EPDC provides a dynamic Quality of Service (QoS) priority elevation mechanism that can be leveraged at the SoC level.

The EPDC\_FIFOCTRL registers can be used to drive the epdc\_panic output signal during times when the EPDC requests require priority elevation. As long as epdc\_panic is asserted, transaction requests from the EPDC will have their priority elevated at the SoC-level bus arbitration control points.

The registers and associated functionality are as follows:

- EPDC\_FIFOCTRL[ENABLE\_PRIORITY] must be set to enable epdc\_panic functionality.
- EPDC\_FIFOCTRL[FIFO\_L\_LEVEL] determines FIFO threshold which causes epdc\_panic to assert when crossed.
- EPDC\_FIFOCTRL[FIFO\_H\_LEVEL] once epdc\_panic has been asserted due to the pixel FIFO(s) crossing FIFO\_L\_LEVEL, this value, which must be set higher than FIFO\_L\_LEVEL, determines the point at which epdc\_panic will de-assert as the FIFO(s) fills.

Note that the delta between FIFO\_H\_LEVEL and FIFO\_L\_LEVEL is intended as a de-bounce mechanism. The purpose is to avoid a constant panic situation, which would cause thrashing of the epdc\_panic signal.

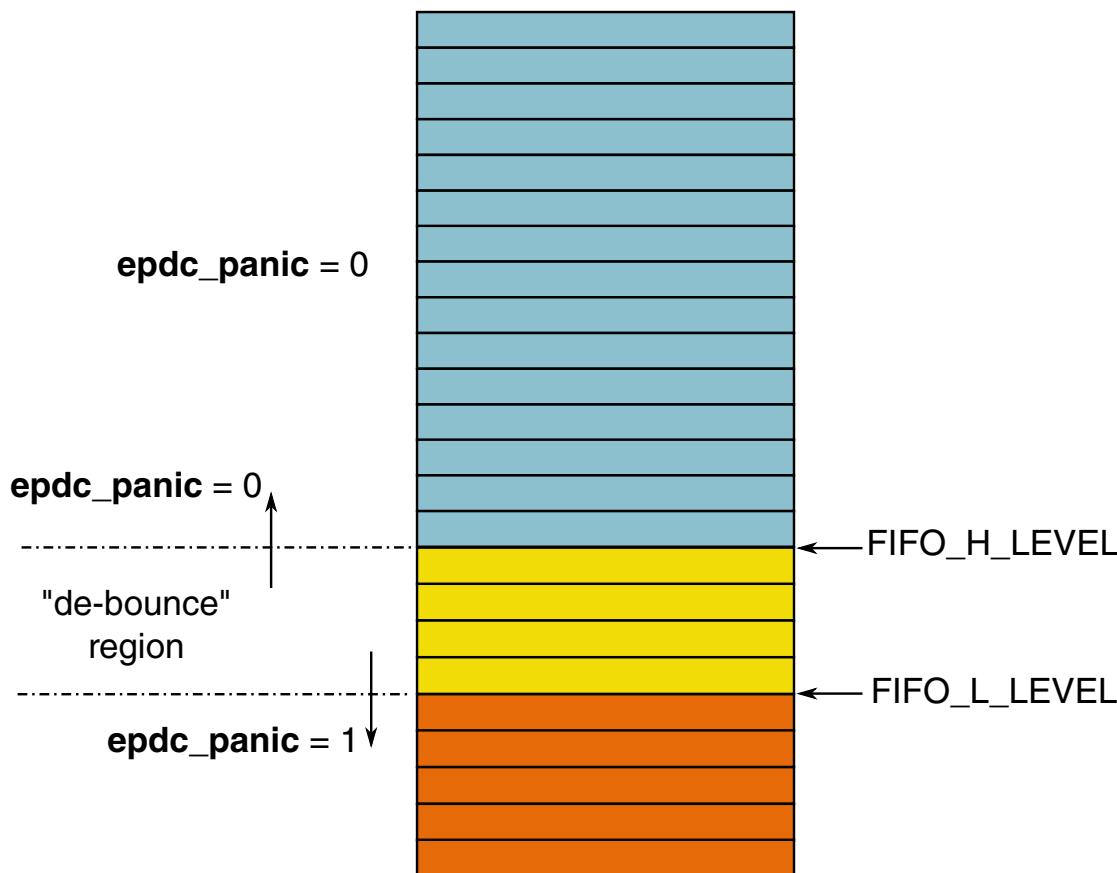

Figure 23-12. FIFO Priority Elevation

## 23.4 EPDC Memory Map/Register Definition

### EPDC Register Format Summary

EPDC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
228_C000	EPDC Control Register (EPDC_CTRL)	32	R/W	C000_0000h	<a href="#">23.4.1/1080</a>
228_C004	EPDC Control Register (EPDC_CTRL_SET)	32	R/W	C000_0000h	<a href="#">23.4.1/1080</a>
228_C008	EPDC Control Register (EPDC_CTRL_CLR)	32	R/W	C000_0000h	<a href="#">23.4.1/1080</a>
228_C00C	EPDC Control Register (EPDC_CTRL_TOG)	32	R/W	C000_0000h	<a href="#">23.4.1/1080</a>
228_C010	EPDC Working Buffer Address for TCE (EPDC_WB_ADDR_TCE)	32	R/W	0000_0000h	<a href="#">23.4.2/1082</a>
228_C020	EPDC Waveform Address Pointer (EPDC_WVADDR)	32	R/W	0000_0000h	<a href="#">23.4.3/1082</a>
228_C030	EPDC Working Buffer Address (EPDC_WB_ADDR)	32	R/W	0000_0000h	<a href="#">23.4.4/1083</a>

Table continues on the next page...

## EPDC memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
228_C040	EPDC Screen Resolution (EPDC_RES)	32	R/W	0000_0000h	23.4.5/1083

### 23.4.1 EPDC Control Register (EPDC\_CTRLn)

EPDC Main control register

This register controls various high-level functions of the EPDC

## EXAMPLE

```
/* Reset */
    __raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
    while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
        ;
    __raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
    __raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
    while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
        ;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 228\_C000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### EPDC\_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal EPDC operation. Set this bit to one (default) to disable clocking with the EPDC and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the EPDC block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–8 -	This field is reserved. Reserved.
7–6 UPD_DATA_SWIZZLE	Specifies how to swap the bytes for the UPD data before the WB construction. Please note this swizzle operate right after data fetch from bus, no matter it's aligned access or not. Supported configurations:  0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka BigEndian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.

Table continues on the next page...

**EPDC\_CTRLn field descriptions (continued)**

Field	Description
5–4 LUT_DATA_SWIZZLE	Specifies how to swap the bytes for the LUT data before store to LUTRAM. Supported configurations: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x1 <b>ALL_BYTES_SWAP</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka BigEndian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
-	This field is reserved. Reserved.

### 23.4.2 EPDC Working Buffer Address for TCE (EPDC\_WB\_ADDR\_TCE)

#### EPDC Working Buffer Address for TCE

Address: 228\_C000h base + 10h offset = 228\_C010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																

Reset 0

**EPDC\_WB\_ADDR\_TCE field descriptions**

Field	Description
ADDR	Address for EPDC working buffer. This address must be aligned to a 64-bit double-word boundary.

### 23.4.3 EPDC Waveform Address Pointer (EPDC\_WVADDR)

#### EPDC Waveform Address Pointer

#### EXAMPLE

```
/* Reset */
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_SET);
while (!(__raw_readl(EPDC_CTRL) & EPDC_CTRL_CLKGATE))
;
__raw_writel(EPDC_CTRL_SFTRST, EPDC_CTRL_CLEAR);

/* Enable clock gating (clear to enable) */
__raw_writel(EPDC_CTRL_CLKGATE, EPDC_CTRL_CLEAR);
while (__raw_readl(EPDC_CTRL) & (EPDC_CTRL_SFTRST | EPDC_CTRL_CLKGATE))
;

/* EPDC_CTRL */
reg_val = __raw_readl(EPDC_CTRL);
reg_val &= ~EPDC_CTRL_UPD_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_UPD_DATA_SWIZZLE_NO_SWAP;
```

```
reg_val &= ~EPDC_CTRL_LUT_DATA_SWIZZLE_MASK;
reg_val |= EPDC_CTRL_LUT_DATA_SWIZZLE_NO_SWAP;
__raw_writel(reg_val, EPDC_CTRL_SET);
```

Address: 228\_C000h base + 20h offset = 228\_C020h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																

Reset 0

#### EPDC\_WVADDR field descriptions

Field	Description
ADDR	Start address of waveform tables. This address needs to be aligned to a 64-bit word boundary.

#### 23.4.4 EPDC Working Buffer Address (EPDC\_WB\_ADDR)

EPDC Working Buffer Address

This register points to the address of current working buffer.

Address: 228\_C000h base + 30h offset = 228\_C030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																

Reset 0

#### EPDC\_WB\_ADDR field descriptions

Field	Description
ADDR	Address for EPDC working buffer. This address must be aligned to a 64-bit double-word boundary.

#### 23.4.5 EPDC Screen Resolution (EPDC\_RES)

EPDC Screen Resolution.

This register defines the horizontal and vertical resolution of the target display panel

Address: 228\_C000h base + 40h offset = 228\_C040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W

### EPDC\_RES field descriptions

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 VERTICAL	Vertical Resolution (in pixels)
15–13 -	This field is reserved. Reserved.
HORIZONTAL	Horizontal Resolution (in pixels)

### 23.4.6 EPDC Format Control Register (EPDC\_FORMATn)

EPDC Pixel format control register. Defines formats for buffer and TFT pixels.

This register controls various functions throughout the digital portion of the chip.

#### EXAMPLE

```
/* EPDC_FORMAT - 2bit TFT and 4bit Buf pixel format */
reg_val = EPDC_FORMAT_TFT_PIXEL_FORMAT_2BIT
    | EPDC_FORMAT_BUF_PIXEL_FORMAT_P4N
    | ((0x0 << EPDC_FORMAT_DEFAULT_TFT_PIXEL_OFFSET) &
        EPDC_FORMAT_DEFAULT_TFT_PIXEL_MASK);
__raw_writel(reg_val, EPDC_FORMAT);
```

Address: 228\_C000h base + 50h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	R	Reserved								DEFAULT_TFT_PIXEL							
	W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	R	Reserved		WB_ADDR_NO_COPY		WB_TYPE		WB_COMPRESS		BUF_PIXEL_FORMAT		Reserved				TFT_PIXEL_FORMAT	
	W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPDC\_FORMATn field descriptions**

Field	Description
31–25 -	This field is reserved. Reserved.
24 BUF_PIXEL_SCALE	Selects method of conversion from 8-bit input  0x0 <b>TRUNCATE</b> — Use Truncate method (LSB) 0x1 <b>ROUND</b> — Use rounding method (with saturation)
23–16 DEFAULT_TFT_PIXEL	Default TFT pixel value. This value is used as the source-driver voltage value (TFT-pixel) for either partial-updates where a pixel has not changed or for any part of the screen which is not being updated during active frame scans.
15 -	This field is reserved. Reserved.
14 WB_ADDR_NO_COPY	1 means do not automatically copy WB_ADDR to WB_ADDR_TCE before starting every frame
13–12 WB_TYPE	00 <b>WB_INTERNAL</b> — internal Working Buffer written by EPDC itself 01 <b>WB_WAVEFORM</b> — working buffer is actually holding waveform 10 <b>WB_EXTERNAL16</b> — 16bit working buffer written by PXP or CPU 11 <b>WB_EXTERNAL32</b> — 32bit working buffer written by PXP or CPU
11 WB_COMPRESS	whether the working buffer is compressed, only available on WB_FORMAT=EXTERNAL16/32 mode
10–8 BUF_PIXEL_FORMAT	this field is deprecated in EPDCv3, replaced by WB_FIELDx where we can specify width for each field  EPDC Input Buffer Pixel format. All update buffers are expected to have 8-bit grayscale pixels. This register defines which MSB's of those pixels are used. It must be noted that this format must match the waveform (e.g. P4N is not compatible with 3-bit waveforms)  0x2 <b>P2N</b> — 2-bit pixel 0x3 <b>P3N</b> — 3-bit pixel 0x4 <b>P4N</b> — 4-bit pixel 0x5 <b>P5N</b> — 5-bit pixel
7–2 -	This field is reserved. Reserved.
TFT_PIXEL_FORMAT	EPDC TFT Pixel Format. This defines how many bits of the SDDO bus are required per pixel. This field must be consistent with the waveform and panel architecture.  0x0 <b>2B</b> — 2-bit 0x1 <b>2BV</b> — 2-bit and VCOM 0x2 <b>4B</b> — 4-bit 0x3 <b>4BV</b> — 4-bit and VCOM

### 23.4.7 Working Buffer Field Setting (EPDC\_WB\_FIELD0)

specify the pixel fields mapping from working buffer to lut index : WB[FROM +LEN:FROM] =>LUT [TO+LEN:TO]

Address: 228\_C000h base + 60h offset = 228\_C060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	FIXED								Reserved					USE_FIXED		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	USAGE				FROM				TO				LEN			
Reset	1	0	0	0	1	0	1	0	1	0	1	0	0	1	0	1

**EPDC\_WB\_FIELD0 field descriptions**

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value  00 <b>NO_FIXED</b> — not using FIXED field 01 <b>USE_FIXED</b> — set this field to a FIXED value which specified by FIXED[31:24] 10 <b>NE_FIXED</b> — mask off this pixel if this field is non equal to FIXED[31:24] 11 <b>EQ_FIXED</b> — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 <b>NOT_USED</b> — NOT USED 011 <b>PARTIAL</b> — PARTIAL (won't contribute to lut lookup index) 100 <b>LUT</b> — LUT 101 <b>CP</b> — CP 110 <b>NP</b> — NP 111 <b>PTS</b> — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

### 23.4.8 Working Buffer Field Setting (EPDC\_WB\_FIELD1)

specify the pixel fields mapping from working buffer to lut index : WB[FROM +LEN:FROM] =>LUT [TO+LEN:TO]

Address: 228\_C000h base + 70h offset = 228\_C070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	FIXED								Reserved					USE_FIXED		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	USAGE		FROM						TO			LEN				
Reset	1	0	1	0	0	0	0	0	0	0	0	0	0	0	1	1

**EPDC\_WB\_FIELD1 field descriptions**

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value  00 <b>NO_FIXED</b> — not using FIXED field 01 <b>USE_FIXED</b> — set this field to a FIXED value which specified by FIXED[31:24] 10 <b>NE_FIXED</b> — mask off this pixel if this field is non equal to FIXED[31:24] 11 <b>EQ_FIXED</b> — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 <b>NOT_USED</b> — NOT USED 011 <b>PARTIAL</b> — PARTIAL 100 <b>LUT</b> — LUT 101 <b>CP</b> — CP 110 <b>NP</b> — NP 111 <b>PTS</b> — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

### 23.4.9 Working Buffer Field Setting (EPDC\_WB\_FIELD2)

specify the pixel fields mapping from working buffer to lut index : WB[FROM +LEN:FROM] =>LUT [TO+LEN:TO]

Address: 228\_C000h base + 80h offset = 228\_C080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	FIXED								Reserved					USE_FIXED		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	USAGE		FROM						TO			LEN				
Reset	1	1	0	0	0	1	0	0	0	1	0	0	0	0	1	1

**EPDC\_WB\_FIELD2 field descriptions**

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value  00 <b>NO_FIXED</b> — not using FIXED field 01 <b>USE_FIXED</b> — set this field to a FIXED value which specified by FIXED[31:24] 10 <b>NE_FIXED</b> — mask off this pixel if this field is non equal to FIXED[31:24] 11 <b>EQ_FIXED</b> — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 <b>NOT_USED</b> — NOT USED 011 <b>PARTIAL</b> — PARTIAL 100 <b>LUT</b> — LUT 101 <b>CP</b> — CP 110 <b>NP</b> — NP 111 <b>PTS</b> — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

### 23.4.10 Working Buffer Field Setting (EPDC\_WB\_FIELD3)

specify the pixel fields mapping from working buffer to lut index : WB[FROM +LEN:FROM] =>LUT [TO+LEN:TO]

Address: 228\_C000h base + 90h offset = 228\_C090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	FIXED								Reserved					USE_FIXED		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	USAGE		FROM						TO			LEN				
Reset	0	1	1	0	1	0	0	0	1	0	0	0	0	0	0	0

**EPDC\_WB\_FIELD3 field descriptions**

Field	Description
31–24 FIXED	used to either force field into a fixed value, or compare to wb field to mask off the pixel
23–18 -	This field is reserved. Reserved
17–16 USE_FIXED	usage of the FIXED value  00 <b>NO_FIXED</b> — not using FIXED field 01 <b>USE_FIXED</b> — set this field to a FIXED value which specified by FIXED[31:24] 10 <b>NE_FIXED</b> — mask off this pixel if this field is non equal to FIXED[31:24] 11 <b>EQ_FIXED</b> — mask off this pixel if this field is equal to FIXED[31:24]
15–13 USAGE	000 <b>NOT_USED</b> — NOT USED 011 <b>PARTIAL</b> — PARTIAL 100 <b>LUT</b> — LUT 101 <b>CP</b> — CP 110 <b>NP</b> — NP 111 <b>PTS</b> — PTS
12–8 FROM	Source Field's LSB
7–4 TO	Target Field's LSB
LEN	Field length minus 1 (0x0 means length=1, 0xf means length=16)

### 23.4.11 EPDC FIFO control register (EPDC\_FIFOCTRLn)

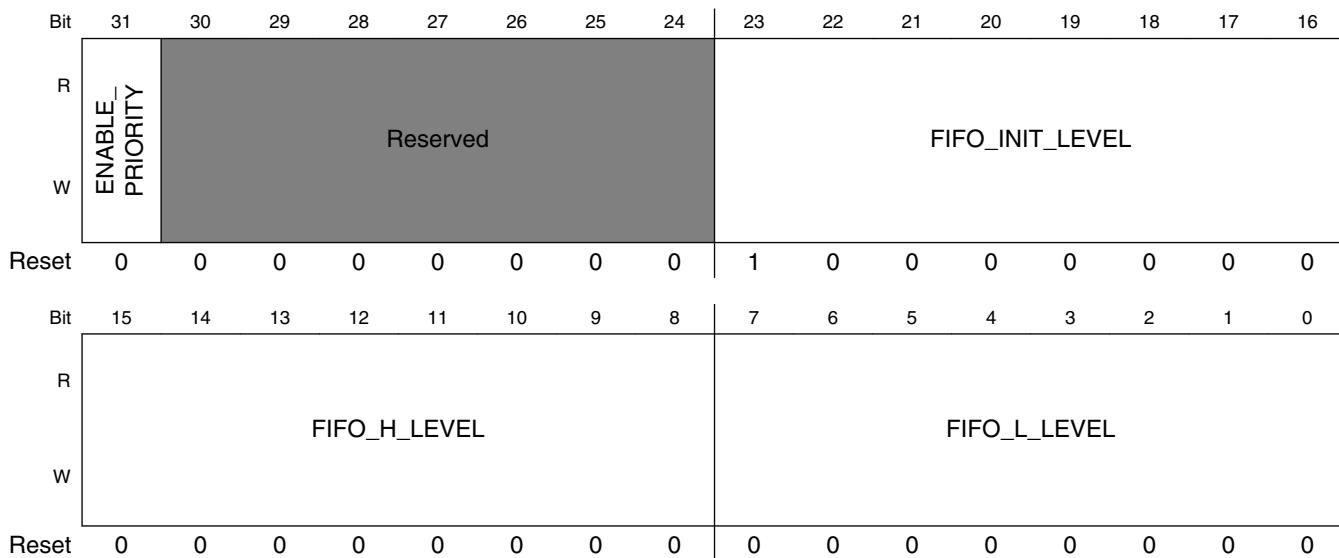

Allows for programmability of pixel FIFO watermarks used in conjunction with system arbitration hardware

This register houses FIFO control bits

## EXAMPLE

```
/* EPDC_FIFOCTRL (disabled) */
reg_val =
    ((100 << EPDC_FIFOCTRL_FIFO_INIT_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_INIT_LEVEL_MASK)
| ((200 << EPDC_FIFOCTRL_FIFO_H_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_H_LEVEL_MASK)
| ((100 << EPDC_FIFOCTRL_FIFO_L_LEVEL_OFFSET) &
     EPDC_FIFOCTRL_FIFO_L_LEVEL_MASK);
__raw_writel(reg_val, EPDC_FIFOCTRL);
```

Address: 228\_C000h base + A0h offset + (4d × i), where i=0d to 3d

### EPDC\_FIFOCTRLn field descriptions

Field	Description
31 ENABLE_PRIORITY	Enable watermark-based priority elevation mechanism. 1=Enabled, 0=Disabled. (Only applies to FIFO_H_LEVEL and FIFO_L_LEVEL)
30–24 -	This field is reserved. Reserved.
23–16 FIFO_INIT_LEVEL	This register sets the watermark for the pixel-fifo.
15–8 FIFO_H_LEVEL	Upper level value of FIFO watermark. Must be greater than FIFO_L_LEVEL. When the pixel FIFO reaches this level or above, the priority elevation request is negated
FIFO_L_LEVEL	Lower level value of FIFO watermark. When the pixel FIFO reaches this level or below, the priority elevation request is asserted.

## 23.4.12 EPDC Update Region Address (EPDC\_UPD\_ADDR)

EPDC Update Region Address

The address alignment depends on whether the update region stride register (EPDC\_UPD\_STRIDE) is set or not.

If EPDC\_UPD\_STRIDE is zero, the update region address must start and end on the 8-byte aligned addresses.

If EPDC\_UPD\_STRIDE is non-zero, the update region address can start and/or end on any byte addressing. But aligned address still recommended be get best bus performance.

## EXAMPLE1

```
/* no update stride case */
u32 stride = 0;
u32 addr = 0x100;      /* 8-byte aligned */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

## EXAMPLE2

```
/* update stride = 345 */
u32 stride = 345;
u32 addr = 0x123;      /* 8-byte unaligned is OK */
__raw_writel(stride, EPDC_UPD_STRIDE);
__raw_writel(addr, EPDC_UPD_ADDR);
```

Address: 228\_C000h base + 100h offset = 228\_C100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R																																	
W																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

### EPDC\_UPD\_ADDR field descriptions

Field	Description
ADDR	Address for incoming region update. This address points to update region which will be processed into the working buffer.

## 23.4.13 EPDC Update Region Stride (EPDC\_UPD\_STRIDE)

### EPDC Update Region Stride

When UPD\_STRIDE==0 (stride feature disabled), UPD buffer line must start from 64-bit boundary and end on 64-bit boundary(padding if not). When UPD\_STRIDE!=0 (stride feature enabled), UPD buffer line can start or end on any byte address, UPD\_WIDTH should be set to real line bytes count as normal, while UPD\_STRIDE set to byte distance between two lines' start.

## EXAMPLE

see details on stride feature introduction

## EPDC Memory Map/Register Definition

Address: 228 C000h base + 110h offset = 228 C110h

## **EPDC\_UPD\_STRIDE field descriptions**

Field	Description
STRIDE	line stride for incoming region update

#### **23.4.14 EPDC Update Command Co-ordinate (EPDC UPD CORD)**

## EPDC Update Command Co-ordinate

This register is used for setting up the coordinate of a new update region.

Address: 228 C000h base + 120h offset = 228 C120h

# **EPDC\_UPD\_CORD field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 YCORD	Y co-ordinate for incoming region update
15–13 -	This field is reserved. Reserved.
XCORD	X co-ordinate for incoming region update

#### 23.4.15 EPDC Update Command Size (EPDC\_UPD\_SIZE)

## EPDC Update Command Size

This register sets up the size of an update region.

Address: 228 C000h base + 140h offset = 228 C140h

**EPDC\_UPD\_SIZE field descriptions**

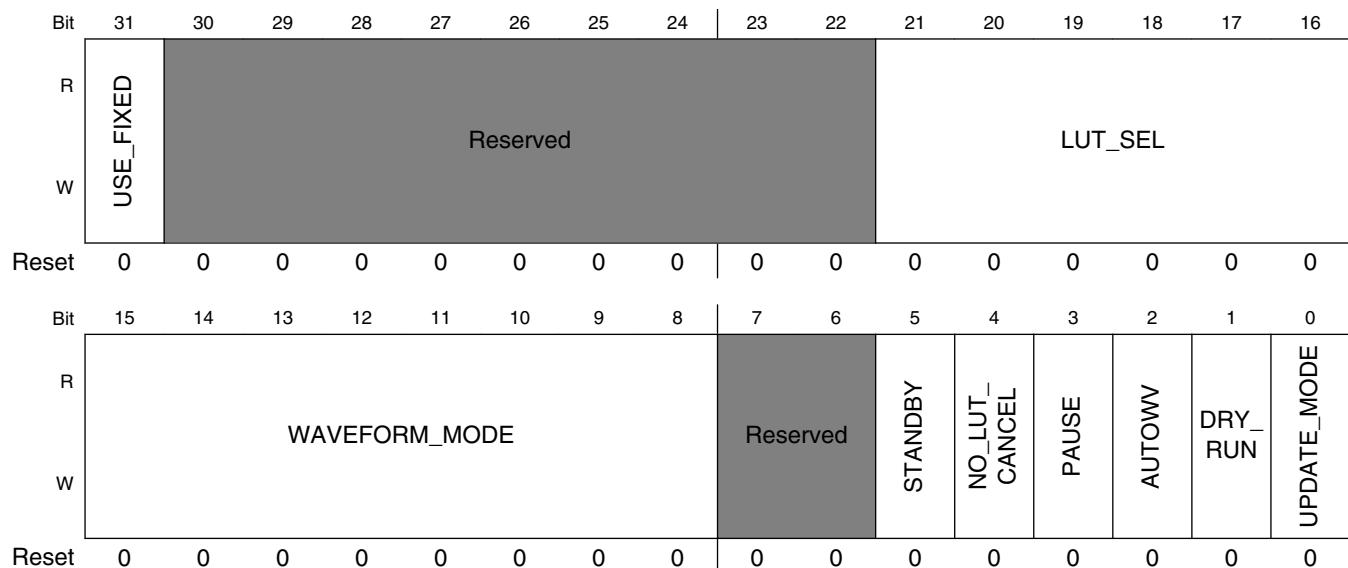

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 -	This field is reserved. Reserved.
WIDTH	Width (in pixels)

**23.4.16 EPDC Update Command Control (EPDC\_UPD\_CTRLn)**

EPDC Update Command Control.

Writing to this registers triggers and update request operation.

Address: 228\_C000h base + 160h offset + (4d × i), where i=0d to 3d

**EPDC\_UPD\_CTRLn field descriptions**

Field	Description
31 USE_FIXED	Use fixed pixel values (requires programming of EPDC_UPD_FIXED)
30–22 -	This field is reserved. Reserved.
21–16 LUT_SEL	LUT select 0-63
15–8 WAVEFORM_MODE	Waveform Mode 0-255

Table continues on the next page...

**EPDC\_UPD\_CTRL*n* field descriptions (continued)**

Field	Description
7–6 -	This field is reserved. Reserved.
5 STANDBY	
4 NO_LUT_ CANCEL	EPDC will cancel LUT loading for void update (no real update needed because of partial or collision), set this bit to 1 to disable this feature
3 PAUSE	0x0 <b>AUTO</b> — epdc will analyze update buffer, report histogram, then update waveform mode using the programmed mode mapping in AUTOWV_LUT and start LUT loading 0x1 <b>MANUAL</b> — epdc will analyze update buffer, report histogram, then pause and waiting software to write again with selected waveform mode to start lut loading
2 AUTOWV	enable automatical waveform mode selection
1 DRY_RUN	Enable Dry Run mode(set to 1). WB won't be updated in this mode, and lut_sel will be ignored, so actually you don't need to wait for LUT available to use this feature
0 UPDATE_MODE	Update Mode 0x0 <b>PARTIAL</b> — Partial Update : only process changed pixels in region 0x1 <b>FULL</b> — Full Update : process all pixels in region

**23.4.17 EPDC Update Fixed Pixel Control (EPDC\_UPD\_FIXED*n*)**

EPDC Update Control register for fixed-pixel updates (enabled via EPDC\_UPD\_CTRL[USE\_FIXED])

Address: 228\_C000h base + 180h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	FIXNP_EN	FIXCP_EN														
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## **EPDC\_UPD\_FIXEDn field descriptions**

Field	Description
31 FIXNP_EN	If set to 1, current updated region has the NP value defined by FIXNP
30 FIXCP_EN	If set to 1, current updated region has the CP value defined by FIXCP
29–16 -	This field is reserved. Reserved.
15–8 FIXNP	NP value if fixnp_en is set to 1. Data in Y8 format.
FIXCP	CP value if fixcp_en is set to 1. Data in Y8 format.

### 23.4.18 EPDC Temperature Register (EPDC\_TEMP)

## EPDC Temperature Compensation Register

Address: 228 C000h base + 1A0h offset = 228 C1A0h

## **EPDC TEMP field descriptions**

Field	Description
TEMPERATURE	Temperature Value. This value is simply an index (not a temperature value). The index is used by the EPDC to access the correct temperature compensated waveform.

### **23.4.19 Waveform Mode Lookup Table Control Register. (EPDC AUTOWV LUT)**

This register is used to access the waveform mode lookup table.

DATA -> AUTOWV\_LUT[ADDR] : Writing this reg with 'ADDR' and 'DATA' info will get 'DATA' written to AUTOWV LUT mem indexed with 'ADDR'

Address: 228 C000h base + 1C0h offset = 228 C1C0h

## **EPDC\_AUTOWV\_LUT field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved, always set to zero.
23–16 DATA	DATA
15–3 -	This field is reserved. Reserved, always set to zero.
ADDR	ADDR

### **23.4.20 EPDC LUT Standby Register for LUT 31~0 (EPDC\_LUT\_STANDBY1n)**

Address: 228\_C000h base + 1E0h offset + (4d × i), where i=0d to 3d

## EPDC LUT STANDBY1*n* field descriptions

Field	Description
LUTN	LUT 0~31 standby control

### **23.4.21 EPDC LUT Standby Register for LUT 63~32 (EPDC\_LUT\_STANDBY2n)**

Address: 228\_C000h base + 1F0h offset + (4d x i), where i=0d to 3d

## **EPDC\_LUT\_STANDBY2n field descriptions**

Field	Description
LUTN	LUT 32~64 Standby Control

## 23.4.22 EPDC Timing Control Engine Control Register (EPDC\_TCE\_CTRL $n$ )

## TCE general control register

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 228\_C000h base + 200h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
	Reserved								VSCAN_HOLDOFF							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
	Reserved					VCOM_VAL	VCOM_MODE	DDR_MODE	LVDS_MODE_CE	LVDS_MODE	SCAN_DIR_1	SCAN_DIR_0	Reserved	SDDO_WIDTH	PIXELS_PER_SDCLK	
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

### EPDC\_TCE\_CTRLn field descriptions

Field	Description
31–25 -	This field is reserved. Reserved.
24–16 VSCAN_HOLDOFF	This period (expressed in vertical lines), sets the portion of the vertical blanking available for new LUTs to be activated. The remainder of the blanking period is reserved for pre-filling the TCE pixel FIFOs. Increasing this value allows for multiple smaller updates to be intercepted by the current frame scan. This number should not exceed FRAME_END+FRAME_SYNC+FRAME_BEGIN. Increasing this value can improve the ability for any given update to intercept the next available frame-scan. Excessive values can result in TCE FIFO under-runs.
15–12 -	This field is reserved. Reserved.
11–10 VCOM_VAL	When VCOM_MODE = MANUAL, this value is used to manually set the VCOM value for the VCOM[1:0] pins
9 VCOM_MODE	This field determines the method used to drive the VCOM signal. 0x0 <b>MANUAL</b> — VCOM Value is set manually using VCOM_VAL field 0x1 <b>AUTO</b> — VCOM Value is used from waveform
8 DDR_MODE	If set, SDDO data is driven on both positive and negative edges of SDCLK. Note that this mode is not supported when SDDO_BUS_FORMAT=16BIT and LVDS is not used. This must always be set when LVDS_MODE is set.

Table continues on the next page...

**EPDC\_TCE\_CTRLn field descriptions (continued)**

Field	Description
7 LVDS_MODE_CE	If set (together with LVDS_MODE=1), SDCE[9:5] shall be driven as the differential inverse of SDCE[4:0]. In this mode the EPDC only supports 5 CE lines.
6 LVDS_MODE	If set, the upper 8-bit of the SDDO bus are used for LVDS differential signalling. Note that this can only be used when SDDO_BUS_FORMAT is set to 16BIT, i.e. LVDS signaling is not supported with an 8-bit SDDO interface. Note that for LVDS_MODE, DDR_MODE must also be set.
5 SCAN_DIR_1	Determines scan direction for each half of the TFT panel  0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
4 SCAN_DIR_0	Determines scan direction for each half of the TFT panel  0x1 <b>UP</b> — Scan this region from bottom to top 0x0 <b>DOWN</b> — Scan this region from top to bottom
3 -	This field is reserved. Reserved
2 SDDO_WIDTH	Selects either 8 or 16 bit SDDO bus format  0x0 <b>8BIT</b> — Connect to 8-bit source driver 0x1 <b>16BIT</b> — Connect to 16-bit source driver
PIXELS_PER_SDCLK	Number of TFT pixels per SDCLK period. Note that this value forms the division of the PIXLK to generate the SDCLK such that SDCLK = PIXCLK/PIXELS_PER_SDCLK.  0x0 <b>RESERVED</b> — Reserved 0x1 <b>TWO</b> — Two TFT-pixels per SDCLK 0x2 <b>FOUR</b> — Four TFT-pixels per SDCLK 0x3 <b>EIGHT</b> — Eight TFT-pixels per SDCLK

### 23.4.23 EPDC Timing Control Engine Source-Driver Config Register (EPDC\_TCE\_SDCFGn)

Source-driver configuration register

Address: 228\_C000h base + 220h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved										SDCLK_HOLD	SDSHR	NUM_CE			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	SDDO_REFORMAT		SDDO_INVERT	PIXELS_PER_CE												
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### EPDC\_TCE\_SDCFGn field descriptions

Field	Description
31–22 -	This field is reserved. Reserved.
21 SDCLK_HOLD	Setting this bit to 1 holds the SDCLK low during LINE_BEGIN
20 SDSHR	Value for source-driver shift direction output port
19–16 NUM_CE	Number of source driver IC chip-enables. Must be 1-10
15–14 SDDO_REFORMAT	This register defines the various re-formatting options to enable more flexibility in the source-driver interface:  0x0 <b>STANDARD</b> — No change. 0x1 <b>FLIP_PIXELS</b> — Reverses the order of the pixels on SDDO. This register setting is sensitive to the TFT pixel width (TFT_PIXEL_FORMAT), e.g. for TFT_PIXEL_FORMAT=2B on an 8-bit bus P3,P2,P1,P0 becomes P0,P1,P2,P3, whereas with TFT_PIXEL_FORMAT=4B, on an 8-bit bus, P1,P0 becomes P0,P1
13 SDDO_INVERT	Setting this bit to 1 reverses the polarity of each SDDO bit so 0xAAAA in 16-bit mode for example becomes 0x5555. This setting can be made in addition to the SDDO_REFORMAT register setting.
PIXELS_PER_CE	Number of pixels (outputs) per source-driver IC. Please note that EPDC_RES[HORIZONTAL] must be an integer multiple of PINS_PER_CE.

### 23.4.24 EPDC Timing Control Engine Gate-Driver Config Register (EPDC\_TCE\_GDCFGn)

This register houses gate-driver configuration.

Address: 228\_C000h base + 240h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R												GDRL		Reserved		
W															GDOE_MODE	GDSP_MODE
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### EPDC\_TCE\_GDCFGn field descriptions

Field	Description
31–16 PERIOD_VSCAN	when vscan state is splitted, this reg defines the counter period
15–5 -	This field is reserved. Reserved.
4 GDRL	Value for gate-driver right/left shift output port
3–2 -	This field is reserved. Reserved.
1 GDOE_MODE	Selects method for driving GDOE signal. When set to 0, GDOE is driven at all times during the frame-scan except FRAME_SYNC. When set to 1, GDOE is driven as a delayed version of GDCLK delayed by EPDC_TCE_TIMING3[GDOE_OFFSET].
0 GDSP_MODE	Selects method for driving GDSP pulse. When set to 0, GDSP is always fixed to have a pulse width of one line-time. When set to 1, GDSP has a pulse-width determined by the FRAME_SYNC setting. Note that GDSP_MODE=1 is not compatible with the GDSP_OFFSET function

### 23.4.25 EPDC Timing Control Engine Horizontal Timing Register 1 (EPDC\_TCE\_HSCAN1n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 228\_C000h base + 260h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				LINE_SYNC_WIDTH								Reserved				LINE_SYNC															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

#### EPDC\_TCE\_HSCAN1n field descriptions

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_SYNC_WIDTH	Number of PIXCLK cycles for the SDLE active time. Note that this value cannot be larger than LINE_SYNC and must be greater than 0. Typically it is recommended to set this value to be the same as LINE_SYNC
15–12 -	This field is reserved. Reserved.
LINE_SYNC	Number of PIXCLK cycles for line sync duration. Note that this value encompasses the LINE_SYNC_WIDTH duration. This value must be programmed to a multiple of SDCLK cycles

### 23.4.26 EPDC Timing Control Engine Horizontal Timing Register 2 (EPDC\_TCE\_HSCAN2n)

Horizontal scan timing registers. Note that all timing values are expressed in terms of the EPDC's internal PIXCLK, which depending on the PIXELS\_PER\_SDCLK register setting is either 2:1 or 4:1

This register houses Horizontal scan timing. Note that line data length is derived from EPDC\_RES.

Address: 228\_C000h base + 280h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				LINE_END								Reserved				LINE_BEGIN

**EPDC\_TCE\_HSCAN2n field descriptions**

Field	Description
31–28 -	This field is reserved. Reserved.
27–16 LINE_END	Number of PIXCLK cycles for line end duration. This defines the duration from the de-assertion of SDCE and assertion of the next SDLE.
15–12 -	This field is reserved. Reserved.
LINE_BEGIN	Number of PIXCLK cycles for line begin duration. This defines the interval between de-assertion of SDLE and assertion of the SDCE signals. This value must be programmed to a multiple of SDCLK cycles

**23.4.27 EPDC Timing Control Engine Vertical Timing Register (EPDC\_TCE\_VSCANn)**

Vertical scan timing registers

This register houses vertical scan timing. Note that frame data length is derived from EPDC\_RES.

Address: 228\_C000h base + 2A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W

### EPDC\_TCE\_OEn field descriptions

Field	Description
31–24 SDOED_WIDTH	Number of PIXCLK cycles from SDOED high to SDOED falling (Must be greater than 0)
23–16 SDOED_DLY	Number of PIXCLK cycles from SDOEZ low to SDOED rising (Must be greater than 0)
15–8 SDOEZ_WIDTH	Number of PIXCLK cycles from SDOEZ high to SDOEZ falling (Must be greater than 0)
SDOEZ_DLY	Number of PIXCLK cycles from SDLE falling edge to SDOEZ rising (Must be greater than 0)

## 23.4.29 EPDC Timing Control Engine Driver Polarity Register (EPDC\_TCE\_POLARITYn)

This register allows for programming the polarity of source/gate driver control signals

This register houses FIFO control bits

Address: 228\_C000h base + 2E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W																																

Reset 0 1

**EPDC\_TCE\_TIMING2n field descriptions**

Field	Description
31–16 GDCLK_HP	This register controls the GDCLK high-pulse width. It is expressed by N PIXCLKs where N=1 to 65535. Note that GDCLK will always have a period equal to the line-clock timing. A value of 0 is not supported. It is recommended that this value be set to at least a half line-clock time. For panels which use GDCLK to drive GDOE, this high-pulse width should be set to cover the majority of the line timing
GDSP_OFFSET	This register allows the user to shift the GDSP pulse by N PIXCLKs where N=1 to 65535. Note that GDSP will always have a pulse width equivalent to the line-clock timing. A value of 0 is not supported.

### 23.4.32 EPDC Timing Control Engine Timing Register 3 (EPDC\_TCE\_TIMING3n)

This register contains various timing adjustment controls

This register houses general purpose timing adjustment registers

Address: 228\_C000h base + 320h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LUTN_CMPLT_IRQ	LUT 0~31 Complete Interrupt

### 23.4.38 EPDC Interrupt Register for LUT 32~63 (EPDC\_IRQ2n)

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is competed on the screen. Each interrupt has a corresponding mask register in EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 228\_C000h base + 3F0h offset + (4d x i), where i=0d to 3d

## **EPDC\_IRQ2n field descriptions**

Field	Description
LUTN_CMPLT_IRQ	LUT 32~64 Complete Interrupt

### 23.4.39 EPDC IRQ Mask Register (EPDC IRQ MASK $n$ )

Controls masking for all EPDC interrupts

This register controls IRQ masks for all EPDC interrupts

Address: 228 C000h base + 400h offset + (4d × i), where i=0d to 3d

## EPDC IRQ MASKn field descriptions

Field	Description
31–24 - Reserved.	This field is reserved. Reserved.
23 PWR_IRQ_EN	Enable power interrupt

*Table continues on the next page...*

**EPDC\_IRQ\_MASKn field descriptions (continued)**

Field	Description
22 UPD_DONE_ IRQ_EN	Enable UPD complete interrupt
21 TCE_IDLE_IRQ_ EN	Enable TCE Idle interrupt detection.
20 BUS_ERROR_ IRQ_EN	Enable AXI BUS ERROR interrupt detection.
19 FRAME_END_ IRQ_EN	If this bit is set, EPDC will assert the current frame end interrupt. This irq is only available during updating period.
18 TCE_ UNDERRUN_ IRQ_EN	Enable pixel FIFO under-run condition detection.
17 COL_IRQ_EN	Enable collision detection interrupts for all LUTs
16 WB_CMPLT_ IRQ_EN	Enable WB complete interrupt
-	This field is reserved. Reserved.

**23.4.40 EPDC Interrupt Register (EPDC\_IRQn)**

EPDC LUT Completion IRQs. The IRQ for a specific LUT is triggered when it's corresponding physical update is completed on the screen. Each interrupt has a corresponding mask register in EPDC\_IRQ\_MASK

This register houses the interrupt bits for the LUT Completions

Address: 228\_C000h base + 420h offset + (4d × i), where i=0d to 3d

NEXT_LUT	Next available LUT value

### 23.4.44 EPDC LUT Collision Status (EPDC\_STATUS\_COL1n)

EPDC LUT Collision Status Register and works in conjunction with EPDC\_IRQ[LUT\_COL IRQ]. When a collision occurs the interrupt is set and all status bits are set for LUTs which were touched by the collision. It does not set the bit for the LUT which caused the collision. There is a single interrupt mask which is used to control all the IRQ bits in this register (in EPDC\_IRQ\_MASK). Note that a collision caused by a LUT which was set-up for no collision detection will not trigger any collision LUT IRQ or status update. Note that clearing the interrupt bit EPDC\_IRQ[LUT\_COL IRQ] clears this register

Address: 228\_C000h base + 480h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_STATUS\_COL2n field descriptions**

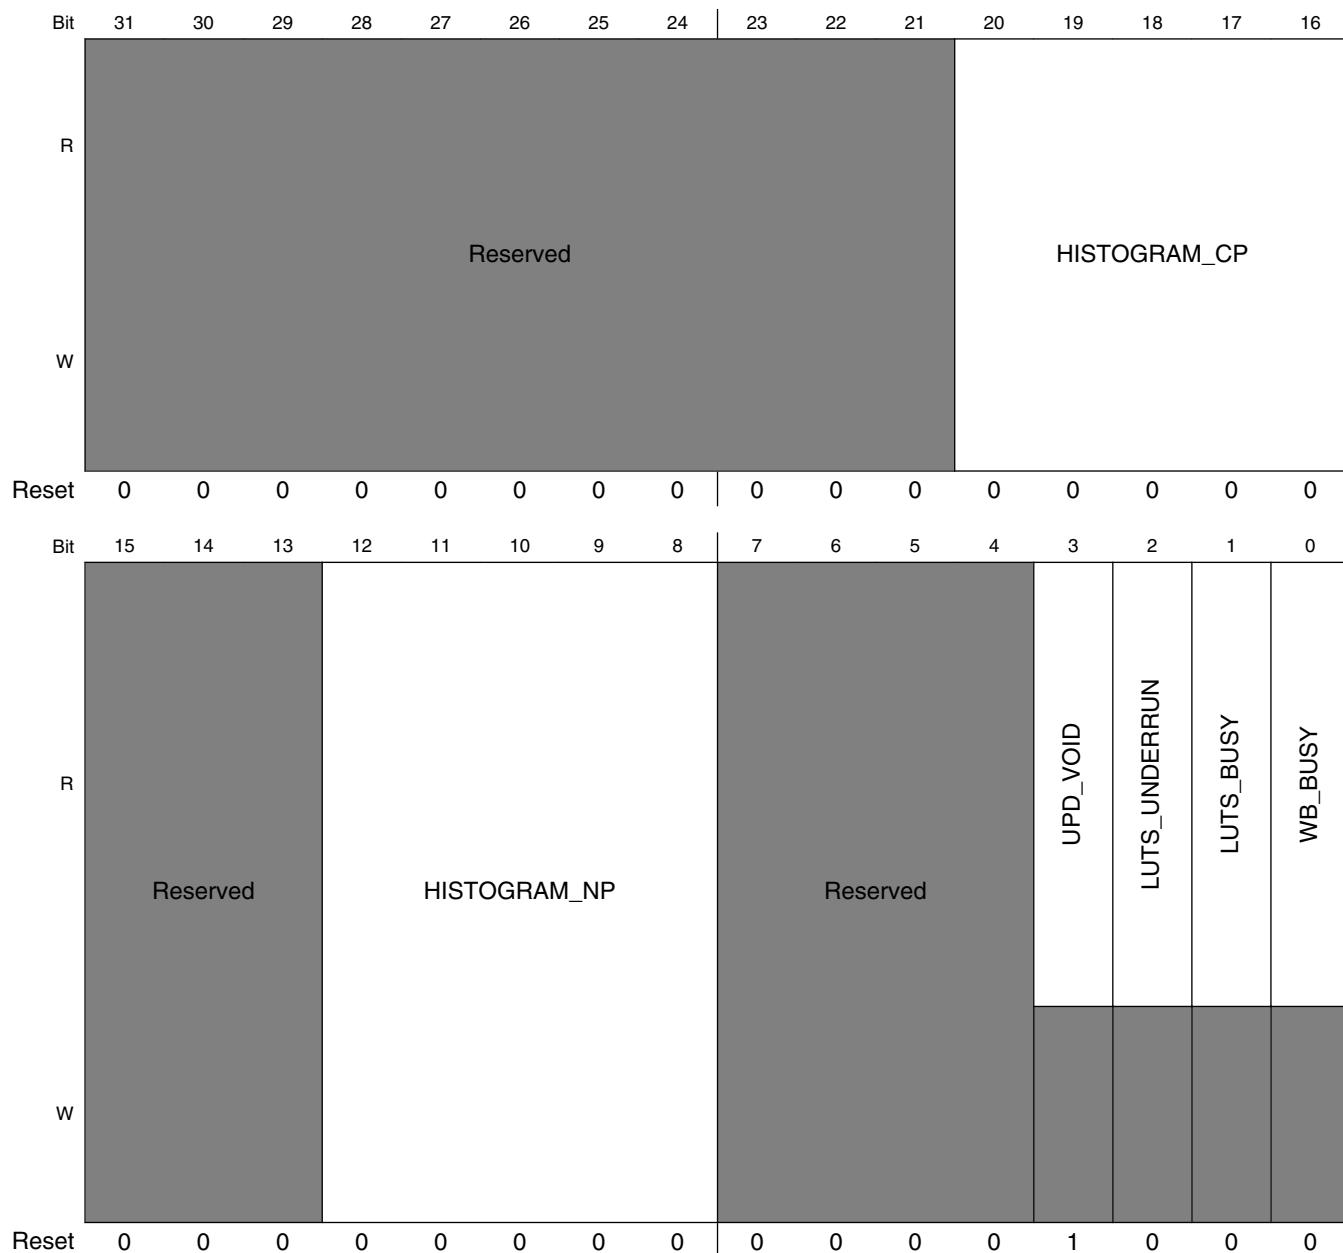

Field	Description
LUTN_COL_STS	LUTn Collision Status

**23.4.46 EPDC General Status Register (EPDC\_STATUSn)**

Register to house non LUT specific status bits

This register houses general status bits

Address: 228\_C000h base + 4A0h offset + (4d × i), where i=0d to 3d

**EPDC\_STATUSn field descriptions**

Field	Description
31–21 -	This field is reserved. Reserved.
20–16 HISTOGRAM_CPY	Indicates which histogram matched the existing bitmap(CP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
15–13 -	This field is reserved. Reserved.
12–8 HISTOGRAM_NP	Indicates which histogram matched the processed bitmap(NP). Bit[0] indicates that the bitmap pixels were fully contained within the HIST1 (single color) histogram. Bit[1] indicates that the bitmap pixels were fully contained within the HIST2 (black / white) histogram. Bit[2] indicates that the bitmap pixels were fully contained within the HIST4 (2-bit grayscale) histogram. Bit[3] indicates that the bitmap pixels were fully contained within the HIST8 (3-bit grayscale) histogram. Bit[4] indicates that the bitmap pixels were fully contained within the HIST16 (4-bit grayscale) histogram.
7–4 -	This field is reserved. Reserved.
3 UPD_VOID	Indicates that the update buffer is void. This means either no pixels need updating or all pixels requiring updating were collided.
2 LUTS_UNDERRUN	Provides a summary status of LUT fill. 1= not enough time for active luts read during blanking period before vscan_holdoff. 0=complete all active luts fill during blanking period before VSCAN_HOLDOFF.
1 LUTS_BUSY	Provides a summary status of LUTs. 1= All LUTs are busy, 0= LUTs are available
0 WB_BUSY	Working buffer process is busy cannot accept new update requests. When WB_BUSY is 1, software should wait for the WB_CMPLT_IRQ interrupt. When this interrupt occurs WB_BUSY is cleared immediately. This is a real-time status of the process.

**23.4.47 EPDC Collision Region Co-ordinate  
(EPDC\_UPD\_COL\_CORD)**

EPDC Collision Region Co-ordinate, cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 228\_C000h base + 4C0h offset = 228\_C4C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_UPD\_COL\_CORD field descriptions**

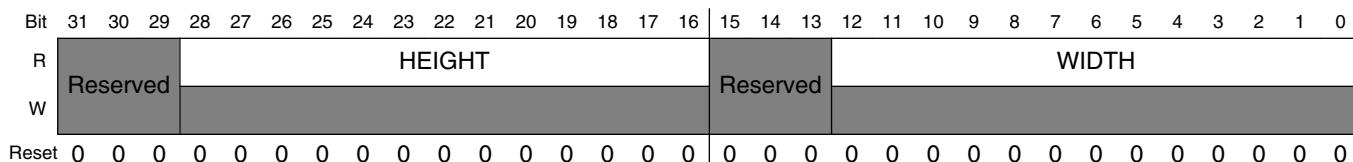

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 YCORD	Y co-ordinate for collision region of the latest completed update
15–13 -	This field is reserved. Reserved.
XCORD	X co-ordinate for collision region of the latest completed update

**23.4.48 EPDC Collision Region Size (EPDC\_UPD\_COL\_SIZE)**

EPDC Collision Region Size of the latest completed update cleared when new update issued

This register only valid after WB completion and collision happens.

Address: 228\_C000h base + 4E0h offset = 228\_C4E0h

**EPDC\_UPD\_COL\_SIZE field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved.
28–16 HEIGHT	Height (in pixels)
15–13 -	This field is reserved. Reserved.
WIDTH	Width (in pixels)

**23.4.49 1-level Histogram Parameter Register.  
(EPDC\_HIST1\_PARAM)**

This register specifies the valid values for a 1-level(single color) histogram. If all pixels in a bitmap is only one color, STATUS[0] will be set at the end of frame processing. All comparator values should be programmed such that they are consistent with the TFT\_PIXEL\_FORMAT control field.

## EPDC Memory Map/Register Definition

Address: 228\_C000h base + 600h offset = 228\_C600h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPDC\_HIST16\_PARAM3 field descriptions**

Field	Description
31–29 -	This field is reserved. Reserved, always set to zero.
28–24 VALUE15	GRAY15 (White) value for 16-level histogram

*Table continues on the next page...*

**EPDC\_HIST16\_PARAM3 field descriptions (continued)**

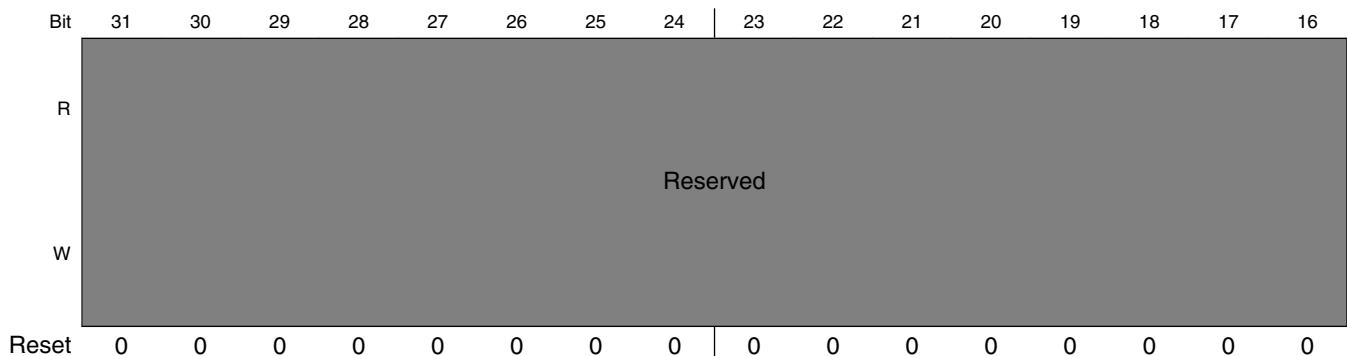

Field	Description
23–21 -	This field is reserved. Reserved, always set to zero.
20–16 VALUE14	GRAY14 value for 16-level histogram
15–13 -	This field is reserved. Reserved, always set to zero.
12–8 VALUE13	GRAY13 value for 16-level histogram
7–5 -	This field is reserved. Reserved, always set to zero.
VALUE12	GRAY12 value for 16-level histogram

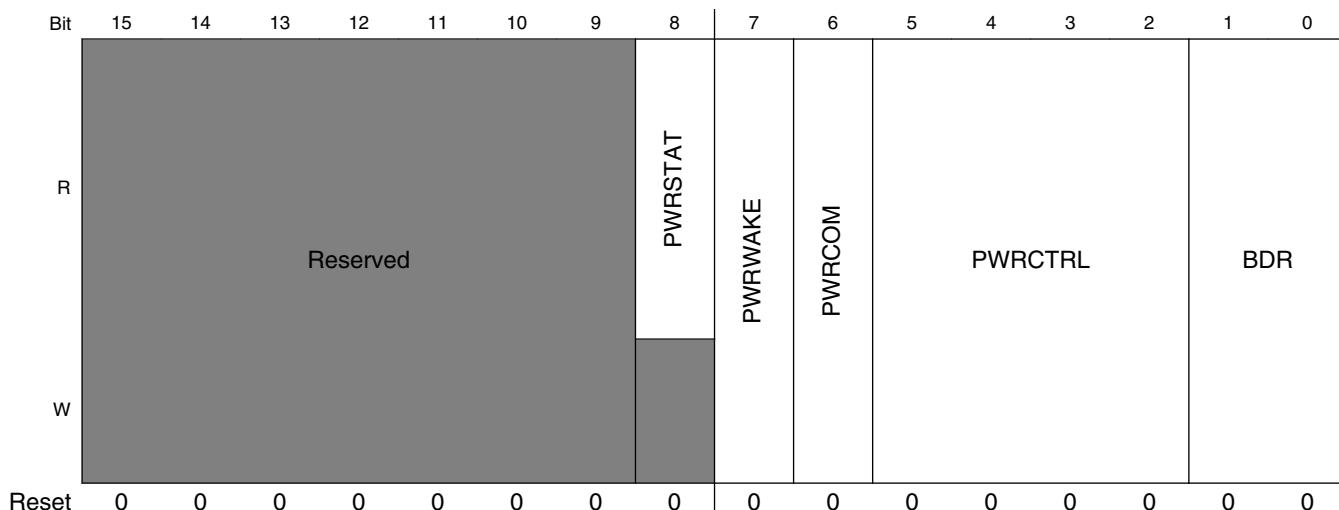

**23.4.58 EPDC General Purpose I/O Debug register (EPDC\_GPIOn)**

GPIO register to control `ipp_epdc_bdr[1:0]`, `ipp_epdc_pwr[3:0]` and `ipp_epdc_pwrcm` output signals

Houses software control signal registers

Address: 228\_C000h base + 700h offset + (4d × i), where i=0d to 3d

### EPDC\_GPIOn field descriptions

Field	Description
31–9 -	This field is reserved. Reserved.
8 PWRSTAT	reflect ipp_epdc_pwrstat input
7 PWRWAKE	Controls ipp_epdc_pwrwake output
6 PWRCOM	Controls ipp_epdc_pwrcom output
5–2 PWRCTRL	Controls ipp_epdc_pwrctrl[3:0] output
BDR	Controls ipp_epdc_bdr[1:0] output

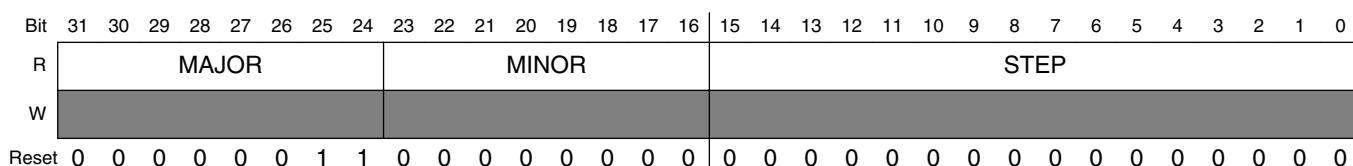

### 23.4.59 EPDC Version Register (EPDC\_VERSION)

This register reflects the version number for the EPDC.

#### EXAMPLE

No Example.

Address: 228\_C000h base + 7F0h offset = 228\_C7F0h

**EPDC\_VERSION field descriptions**

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

**23.4.60 Panel Interface Signal Generator Register 0\_0  
(EPDC\_PIGEON\_0\_0)**

parameters for timing signal generation

Address: 228\_C000h base + 800h offset = 228\_C800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

# Chapter 24

## Enhanced Periodic Interrupt Timer (EPIT)

### 24.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

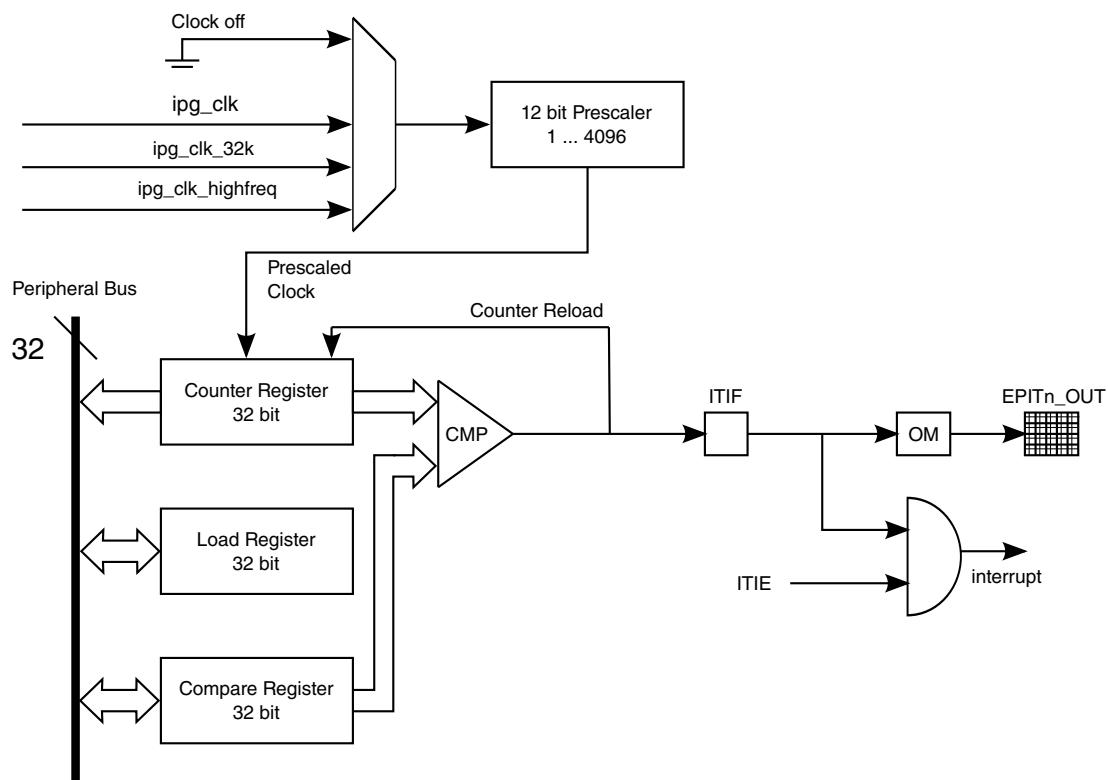

Figure 24-1. EPIT block diagram

## 24.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

## 24.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- Operating in set-and-forget mode
- Operating in free-running mode

See [Operations](#) for a description of the operations that EPIT supports.

## 24.2 External signals

The following table describes EPIT's I/O signals.

**Table 24-1. EPIT External Signals**

Signal	Description	Pad	Mode	Direction
EPIT1_OUT	Indicate the occurrence of EPIT1 output compare event through a specified transition.	UART3_RX_DATA	ALT8	O
		JTAG_TMS	ALT8	O
EPIT2_OUT	Indicate the occurrence of EPIT2 output compare event through a specified transition.	UART3_CTS_B	ALT8	O
		JTAG_TDO	ALT8	O

## 24.3 Clocks

The table found here describes the clock sources for EPIT.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 24-2. EPIT Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg\_clk\_highfreq)**

This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb\_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg\_clk\_32k)**

This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb\_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32 kHz crystal.

- **Peripheral clock (ipg\_clk)**

This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT\_EPITCR.** For other programming requirements that apply while changing clock source, refer section [Change of Clock Source](#).

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

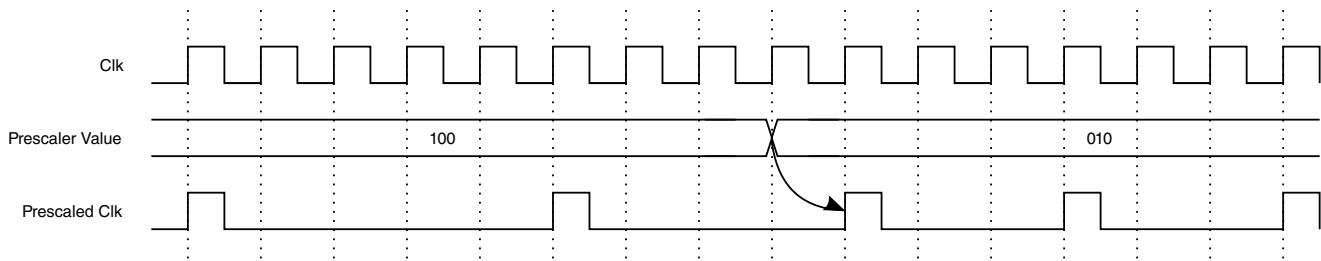

Figure 24-2. Prescaler Value Change Diagram

## 24.4 Functional Description

This section provides a complete functional description of the block.

### 24.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT\_CR[RLD] to select the desired mode.

#### 24.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT\_CR).

In this mode, the counter obtains its data from the load register (EPIT\_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT\_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT\_CR[IOVW]) and write to EPIT\_LR with the required initialization value.

#### 24.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initialize the counter, set the EPIT counter overwrite enable bit (EPIT\_EPITCL[IOVW]) and write to EPIT\_EPITLR with the required initialization value.

## 24.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

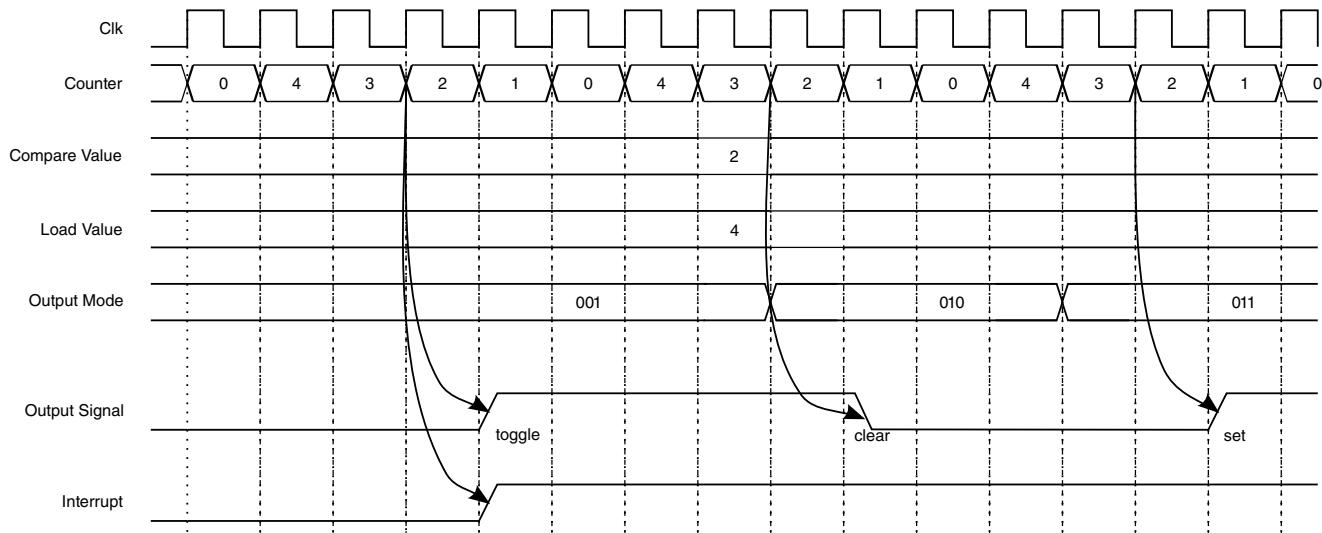

## 24.4.3 Compare Event

When the programmed value of EPIT\_EPITCMPR matches the value in EPIT\_EPITCNR a compare status flag is set, and an interrupt is generated if the OCIEN bit is set in the control register.

## Functional Description

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000\_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF\_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

**Figure 24-3. Compare Event and Interrupt Timing Diagram**

EPIT will generate a compare event in the next count if the EPITx\_CNR from the previous count equals the new EPITx\_CMNR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx\_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx\_CMNR to previous EPITx\_CNR+1. Or, in set and forget mode, configure EPITx\_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx\_CNR.

### 24.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

### 24.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

### 24.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

## 24.5 Initialization/ Application Information

### 24.5.1 Change of Clock Source

The CLKSRC field in EPIT\_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

1. Disable the EPIT - set EN=0 in EPIT\_EPITCR.
2. Disable EPIT output - program OM=00 in the EPIT\_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT\_EPITCR.
5. Clear the EPIT status register (EPIT\_EPITSR), that is, write "1" to clear (w1c).
6. Set ENMOD= 1 in the EPIT\_EPITCR, to bring the EPIT Counter to defined state (EPIT\_EPITLR value or 0xFFFF\_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT\_EPITCR
8. Enable the EPIT interrupts.

## 24.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

**EPIT memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_0000	Control register (EPIT1_CR)	32	R/W	0000_0000h	24.6.1/1174
20D_0004	Status register (EPIT1_SR)	32	R/W	0000_0000h	24.6.2/1177
20D_0008	Load register (EPIT1_LR)	32	R/W	FFFF_FFFFh	24.6.3/1177
20D_000C	Compare register (EPIT1_CMNR)	32	R/W	0000_0000h	24.6.4/1178
20D_0010	Counter register (EPIT1_CNR)	32	R	FFFF_FFFFh	24.6.5/1178
20D_4000	Control register (EPIT2_CR)	32	R/W	0000_0000h	24.6.1/1174
20D_4004	Status register (EPIT2_SR)	32	R/W	0000_0000h	24.6.2/1177
20D_4008	Load register (EPIT2_LR)	32	R/W	FFFF_FFFFh	24.6.3/1177
20D_400C	Compare register (EPIT2_CMNR)	32	R/W	0000_0000h	24.6.4/1178
20D_4010	Counter register (EPIT2_CNR)	32	R	FFFF_FFFFh	24.6.5/1178

### 24.6.1 Control register (EPITx\_CR)

The EPIT control register (EPIT\_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT\_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R				0								0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**EPITx\_CR field descriptions**

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 CLKSRC	Select clock source These bits determine which clock input is to be selected for running the counter. This field value should only be changed when the EPIT is disabled by clearing the EN bit in this register. For other programming requirements while changing clock source, refer to <a href="#">Change of Clock Source</a> .  00 Clock is off 01 Peripheral clock 10 High-frequency reference clock 11 Low-frequency reference clock
23–22 OM	EPIT output mode. This bit field determines the mode of EPIT output on the output pin.  00 EPIT output is disconnected from pad 01 Toggle output pin 10 Clear output pin 11 Set output pin
21 STOPEN	EPIT stop mode enable. This read/write control bit enables the operation of the EPIT during stop mode. This bit is reset by a hardware reset and unaffected by software reset.  0 EPIT is disabled in stop mode 1 EPIT is enabled in stop mode
20 Reserved	This read-only field is reserved and always has the value 0.
19 WAITEN	This read/write control bit enables the operation of the EPIT during wait mode. This bit is reset by a hardware reset. A software reset does not affect this bit.  0 EPIT is disabled in wait mode 1 EPIT is enabled in wait mode
18 DBGEN	This bit is used to keep the EPIT functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is reset by hardware reset. A software reset does not affect this bit.  0 Inactive in debug mode 1 Active in debug mode
17 IOVW	EPIT counter overwrite enable. This bit controls the counter data when the modulus register is written. When this bit is set, all writes to the load register overwrites the counter contents and the counter starts subsequently counting down from the programmed value.  0 Write to load register does not result in counter value being overwritten. 1 Write to load register results in immediate overwriting of counter value.

*Table continues on the next page...*

## EPITx\_CR field descriptions (continued)

Field	Description
16 SWR	<p>Software reset. The EPIT is reset when this bit is set to 1. It is a self clearing bit. This bit is set when the block is in reset state and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values, except for the EN, ENMOD, STOPEN, WATEN and DBGEN bits in this control register</p> <p>0 EPIT is out of reset 1 EPIT is undergoing reset</p>
15–4 PRESCALAR	<p>Counter clock prescaler value. This bit field determines the prescaler value by which the clock is divided before it goes to the counter</p> <p>0x000 Divide by 1 0x001 Divide by 2... 0xFFFF Divide by 4096</p>
3 RLD	<p>Counter reload control.</p> <p>This bit is cleared by hardware reset. It decides the counter functionality, whether to run in free-running mode or set-and-forget mode.</p> <p>0 When the counter reaches zero it rolls over to 0xFFFF_FFFF (free-running mode) 1 When the counter reaches zero it reloads from the modulus register (set-and-forget mode)</p>
2 OCIEN	<p>Output compare interrupt enable.</p> <p>This bit enables the generation of interrupt on occurrence of compare event.</p> <p>0 Compare interrupt disabled 1 Compare interrupt enabled</p>
1 ENMOD	<p>EPIT enable mode.</p> <p>When EPIT is disabled (EN=0), both main counter and prescaler counter freeze their count at current count values. ENMOD bit is a r/w bit that determines the counter value when the EPIT is enabled again by setting EN bit. If ENMOD bit is set, then main counter is loaded with the load value (If RLD=1)/0xFFFF_FFFF (If RLD=0) and prescaler counter is reset, when EPIT is enabled (EN=1). If ENMOD is programmed to 0 then both main counter and prescaler counter restart counting from their frozen values when EPIT is enabled (EN=1). If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT/DEBUG), then both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 Counter starts counting from the value it had when it was disabled. 1 Counter starts count from load value (RLD=1) or 0xFFFF_FFFF (If RLD=0)</p>
0 EN	<p>This bit enables the EPIT. EPIT counter and prescaler value when EPIT is enabled (EN = 1), is dependent upon ENMOD and RLD bit as described for ENMOD bit. It is recommended that all registers be properly programmed before setting this bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 EPIT is disabled 1 EPIT is enabled</p>

## 24.6.2 Status register (EPITx\_SR)

The EPIT status register (EPIT\_SR) has a single status bit for the output compare event. The bit is a write 1 to clear bit.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	0															OCIF	
W																w1c	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	

### EPITx\_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 OCIF	Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit.  0 Compare event has not occurred 1 Compare event occurred

## 24.6.3 Load register (EPITx\_LR)

The EPIT load register (EPIT\_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT\_CR is set. If the IOVW bit in the EPIT\_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**EPITx\_LR field descriptions**

Field	Description
LOAD	Load value. Value that is loaded into the counter at the start of each count cycle.

**24.6.4 Compare register (EPITx\_CMNR)**

The EPIT compare register (EPIT\_CMNR) holds the value that determines when a compare event is generated.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R																																	
W																																	

**EPITx\_CMNR field descriptions**

Field	Description
COMPARE	Compare Value. When the counter value equals this bit field value a compare event is generated.

**24.6.5 Counter register (EPITx\_CNR)**

The EPIT counter register (EPIT\_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT\_CR is set, the value of this register can be overwritten with a write to EPIT\_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Field	Description
COUNT	Counter value. This contains the current value of the counter.

# **Chapter 25**

## **Enhanced Serial Audio Interface (ESAI)**

### **25.1 Overview**

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, Sony/Phillips Digital Interface (SPDIF) transceivers, and other DSPs.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. It is a superset of the 56300 Family ESSI peripheral and of the 56000 Family SAI peripheral.

All serial transfers in the module are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is similar in that it is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The following figure shows the ESAI block diagram.

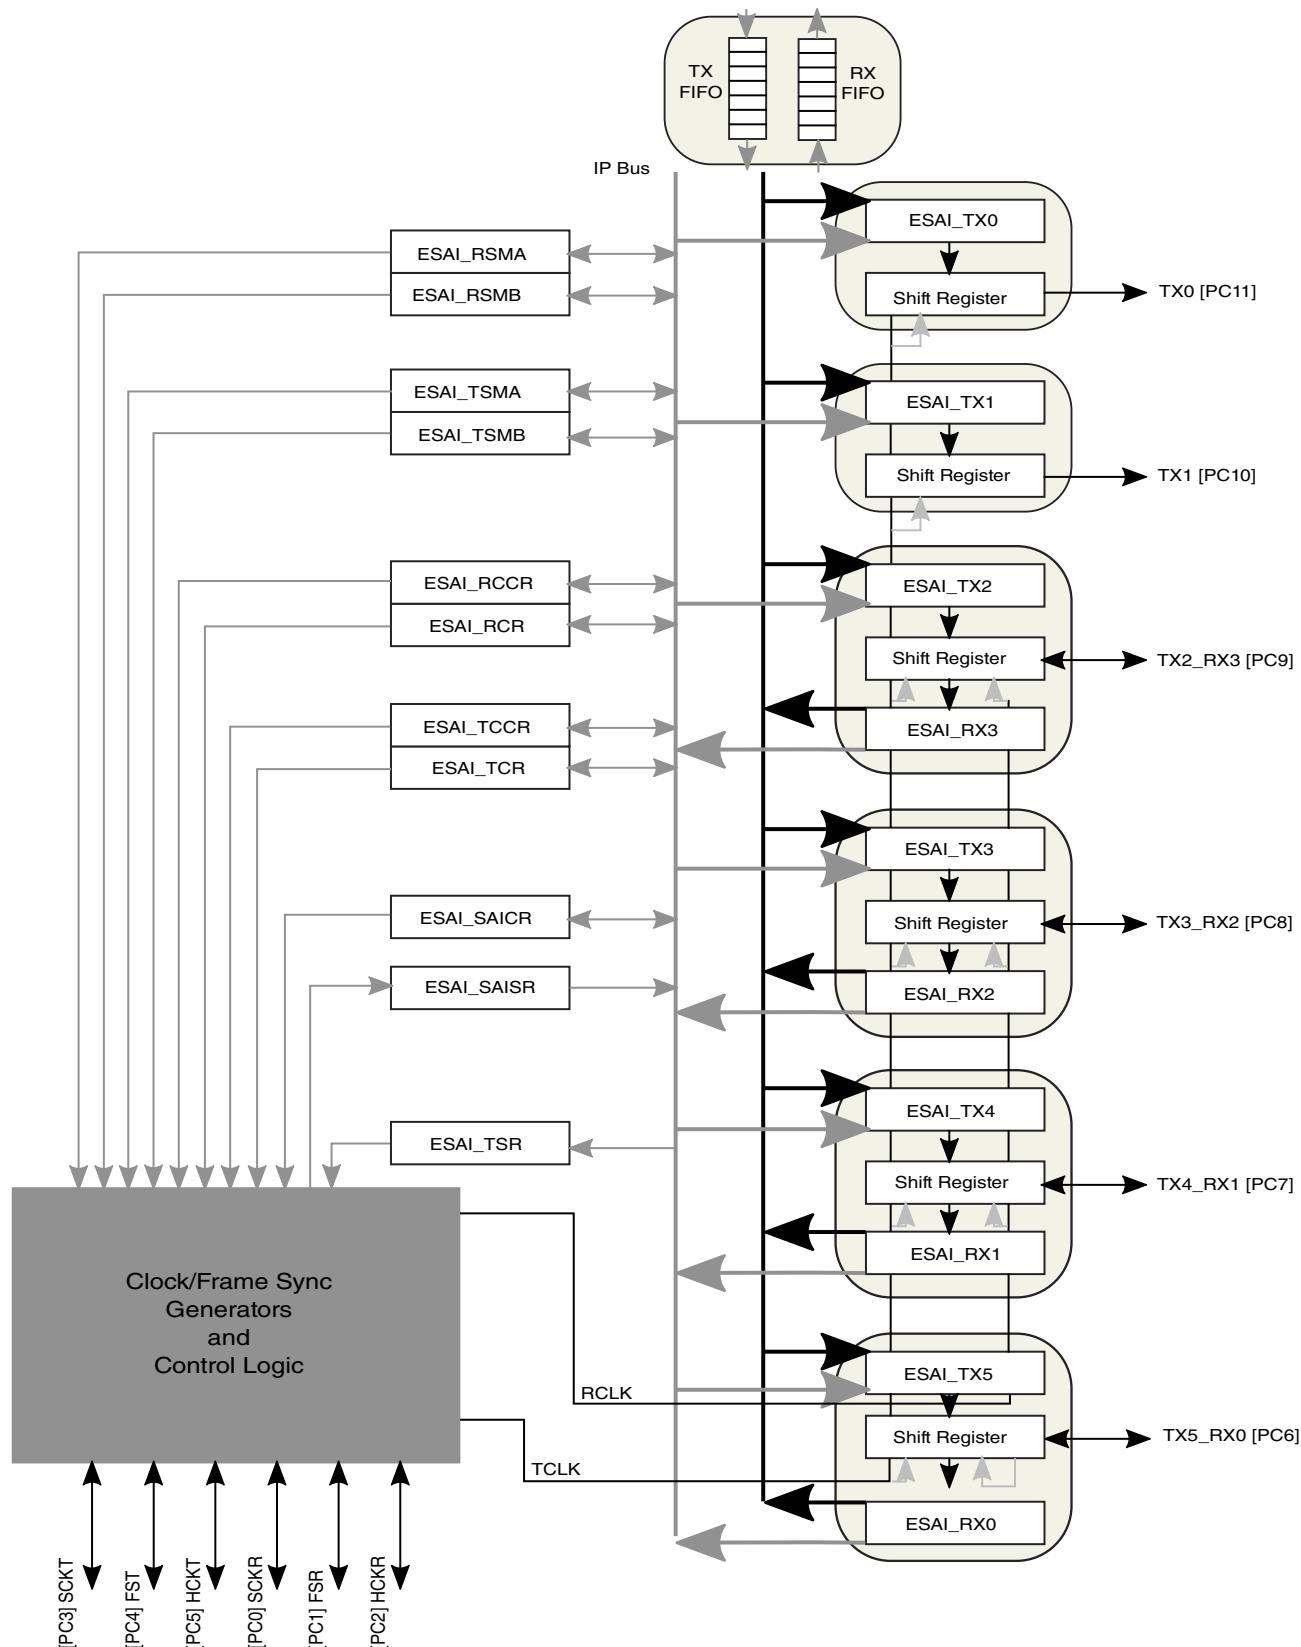

Figure 25-1. ESAI Block Diagram

## 25.1.1 Features

- Independent (asynchronous mode) or shared (synchronous mode) transmit and receive sections with separate or shared internal/external clocks and frame syncs, operating in Master or Slave mode.
- Up to six transmitters and four receivers with TX2\_RX3, TX3\_RX2, TX4\_RX1, and TX5\_RX0 pins shared by transmitters 2 to 5 and receivers 0 to 3. TX0 AND TX1 pins are used by transmitters 0 and 1 only.
- Programmable data interface modes such as I2S, LSB aligned, MSB aligned
- Programmable word length (8, 12, 16, 20 or 24bits)
- Flexible selection between system clock or external oscillator as input clock source, programmable internal clock divider and frame sync generation
- AC97 support
- Time Slot Mask Registers for reduced ARM platform overhead (for both Transmit and Receive)
- 128-word Transmit FIFO shared by six transmitters
- 128-word Receive FIFO shared by four receivers

## 25.1.2 Modes of Operation

ESAI has three basic operating modes and many data/operation formats.

ESAI operating mode are selected by the ESAI control registers (ESAI\_TCCR, ESAI\_TCR, ESAI\_RCCR, ESAI\_RCR, and ESAI\_SAICR). The main operating modes are described in the following section.

### 25.1.2.1 Normal/Network/On-Demand Mode Selection

Selecting between the normal mode and network mode is accomplished by clearing or setting the TMOD0-TMOD1 bits in the ESAI\_TCR register for the transmitter section, as well as in the RMOD0-RMOD1 bits in the ESAI\_RCR register for the receiver section.

For normal mode, the ESAI functions with one data word of I/O per frame (per enabled transmitter or receiver). The normal mode is typically used to transfer data to or from a single device.

For the network mode, 2 to 32 time slots per frame may be selected. During each frame, 0 to 32 data words of I/O may be received or transmitted. In either case, the transfers are periodic. The frame sync signal indicates the first time slot in the frame. Network mode is typically used in time division multiplexed (TDM) networks of codecs, DSPs with multiple words per frame, or multi-channel devices.

Selecting the network mode and setting the frame rate divider to zero (DC=00000) selects the on-demand mode. This special case does not generate a periodic frame sync. A frame sync pulse is generated only when data is available to transmit. The on-demand mode requires that the transmit frame sync be internal (output) and the receive frame sync be external (input). Therefore, for simplex operation, the synchronous mode could be used; however, for full-duplex operation, the asynchronous mode must be used. Data transmission that is data driven is enabled by writing data into each TX. Although the ESAI is double buffered, only one word can be written to each TX, even if the transmit shift register is empty. The receive and transmit interrupts function as usual using TDE and RDE; however, transmit underruns are impossible for on-demand transmission and are disabled.

### **25.1.2.2 Synchronous/Asynchronous Operating Modes**

The transmit and receive sections of the ESAI may be synchronous or asynchronous, that is, the transmitter and receiver sections may use common clock and synchronization signals (synchronous operating mode), or they may have their own separate clock and sync signals (asynchronous operating mode).

The SYN bit in the ESAI\_SAICR register selects synchronous or asynchronous operation. Because the ESAI is designed to operate either synchronously or asynchronously, separate receive and transmit interrupts are provided.

When SYN is cleared, the ESAI transmitter and receiver clocks and frame sync sources are independent. If SYN is set, the ESAI transmitter and receiver clocks and frame sync come from the transmitter section (either external or internal sources).

Data clock and frame sync signals can be generated internally by the ARM Core or may be obtained from external sources. If internally generated, the ESAI clock generator is used to derive high frequency clock, bit clock and frame sync signals from the ARM Core internal system clock.

### **25.1.2.3 Frame Sync Selection**

The frame sync can be either a bit-long or word-long signal.

The transmitter frame format is defined by the TFSL bit in the ESAI\_TCR register. The receiver frame format is defined by the RFSL bit in the ESAI\_RCR register.

1. In the word-long frame sync format, the frame sync signal is asserted during the entire word data transfer period. This frame sync length is compatible with codecs, SPI serial peripherals, serial A/D and D/A converters, shift registers and telecommunication PCM serial I/O.
2. In the bit-long frame sync format, the frame sync signal is asserted for one bit clock immediately before the data transfer period. This frame sync length is compatible with Intel and National components, codecs and telecommunication PCM serial I/O.

The relative timing of the word length frame sync as referred to the data word is specified by the TFSR bit in the ESAI\_TCR register for the transmitter section and by the RFSR bit in the ESAI\_RCR register for the receive section. The word length frame sync may be generated (or expected) with the first bit of the data word, or with the last bit of the previous word. TFSR and RFSR are ignored when a bit length frame sync is selected.

Polarity of the frame sync signal may be defined as positive (asserted high) or negative (asserted low). The TFSP bit in the ESAI\_TCCR register specifies the polarity of the frame sync for the transmitter section. The RFSP bit in the ESAI\_RCCR register specifies the polarity of the frame sync for the receiver section.

The ESAI receiver looks for a receive frame sync leading edge (trailing edge if RFSP is set) only when the previous frame is completed. If the frame sync goes high before the frame is completed (or before the last bit of the frame is received in the case of a bit frame sync or a word length frame sync with RFSR set), the current frame sync is not recognized, and the receiver is internally disabled until the next frame sync. Frames do not have to be adjacent, that is, a new frame sync does not have to immediately follow the previous frame. Gaps of arbitrary periods can occur between frames. Enabled transmitters are tri-stated during these gaps.

When operating in the synchronous mode (SYN=1), all clocks including the frame sync are generated by the transmitter section.

#### 25.1.2.4 Shift Direction Selection

Some data formats, such as those used by codecs, specify MSB first while other data formats, such as the AES-EBU digital audio interface, specify LSB first.

The MSB/LSB first selection is made by programming RSHFD bit in the ESAI\_RCR register for the receiver section and by programming the TSHFD bit in the ESAI\_TCR register for the transmitter section.

## 25.2 External Signals

Three to twelve pins are required for operation, depending on the operating mode selected and the number of transmitters and receivers enabled.

The TX0 and TX1 pins are used by transmitters 0 and 1 only. The TX2\_RX3, TX3\_RX2, TX4\_RX1, and TX5\_RX0 pins are shared by transmitters 2 to 5 with receivers 0 to 3. The actual mode of operation is selected under software control. All transmitters operate fully synchronized under control of the same transmitter clock signals. All receivers operate fully synchronized under control of the same receiver clock signals.

The following table describes the external signals of ESAI:

### 25.2.1 Serial Transmit 0 Data Pin

TX0 is used for transmitting data from the ESAI\_TX0 serial transmit shift register.

TX0 is an output when data is being transmitted from the ESAI\_TX0 shift register. In the on-demand mode with an internally generated bit clock, the TX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX0 may be programmed as a disconnected pin (PC11) when the ESAI TX0 function is not being used. See [Table 25-13](#).

### 25.2.2 Serial Transmit 1 Data Pin

TX1 is used for transmitting data from the ESAI\_TX1 serial transmit shift register.

TX1 is an output when data is being transmitted from the ESAI\_TX1 shift register. In the on-demand mode with an internally generated bit clock, the TX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX1 may be programmed as a disconnected pin (PC10) when the ESAI TX1 function is not being used. See [Table 25-13](#).

### 25.2.3 Serial Transmit 2/Receive 3 Data Pin

TX2\_RX3 is used as the TX2 for transmitting data from the ESAI\_TX2 serial transmit shift register when programmed as a transmitter pin, or as the RX3 signal for receiving serial data to the ESAI\_RX3 serial receive shift register when programmed as a receiver pin.

TX2\_RX3 is an input when data is being received by the ESAI\_RX3 shift register. TX2\_RX3 is an output when data is being transmitted from the ESAI\_TX2 shift register. In the on-demand mode with an internally generated bit clock, the TX2\_RX3 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX2\_RX3 may be programmed as a disconnected pin (PC9) when the ESAI TX2 and RX3 functions are not being used. See [Table 25-13](#).

### 25.2.4 Serial Transmit 3/Receive 2 Data Pin

TX3\_RX2 is used as the TX3 signal for transmitting data from the ESAI\_TX3 serial transmit shift register when programmed as a transmitter pin, or as the RX2 signal for receiving serial data to the ESAI\_RX2 serial receive shift register when programmed as a receiver pin.

TX3\_RX2 is an input when data is being received by the ESAI\_RX2 shift register. TX3\_RX2 is an output when data is being transmitted from the ESAI\_TX3 shift register. In the on-demand mode with an internally generated bit clock, the TX3\_RX2 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX3\_RX2 may be programmed as a disconnected pin (PC8) when the ESAI TX3 and RX2 functions are not being used. See [Table 25-13](#).

### 25.2.5 Serial Transmit 4/Receive 1 Data Pin

TX4\_RX1 is used as the TX4 signal for transmitting data from the ESAI\_TX4 serial transmit shift register when programmed as transmitter pin, or as the RX1 signal for receiving serial data to the RX1 serial receive shift register when programmed as a receiver pin.

## External Signals

TX4\_RX1 is an input when data is being received by the ESAI\_RX1 shift register. TX4\_RX1 is an output when data is being transmitted from the ESAI\_TX4 shift register. In the on-demand mode with an internally generated bit clock, the TX4\_RX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX4\_RX1 may be programmed as a disconnected pin (PC7) when the ESAI TX4 and RX1 functions are not being used. See [Table 25-13](#).

### 25.2.6 Serial Transmit 5/Receive 0 Data Pin

TX5\_RX0 is used as the TX5 signal for transmitting data from the ESAI\_TX5 serial transmit shift register when programmed as transmitter pin, or as the RX0 signal for receiving serial data to the ESAI\_RX0 serial shift register when programmed as a receiver pin.

TX5\_RX0 is an input when data is being received by the ESAI\_RX0 shift register. TX5\_RX0 is an output when data is being transmitted from the ESAI\_TX5 shift register. In the on-demand mode with an internally generated bit clock, the TX5\_RX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX5\_RX0 may be programmed as a disconnected pin (PC6) when the ESAI TX5 and RX0 functions are not being used. See [Table 25-13](#).

### 25.2.7 Receiver Serial Clock

SCKR is a bidirectional pin providing the receivers serial bit clock for the ESAI interface.

The direction of this pin is determined by the RCKD bit in the ESAI\_RCCR register. The SCKR operates as a clock input or output used by all the enabled receivers in the asynchronous mode (SYN = 0), or as serial flag 0 pin in the synchronous mode (SYN = 1).

When this pin is configured as serial flag pin, its direction is determined by the RCKD bit in the ESAI\_RCCR register. When configured as the output flag OF0, this pin reflects the value of the OF0 bit in the ESAI\_SAICR register, and the data in the OF0 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver

sections. When this pin is configured as the input flag IF0, the data value at the pin is stored in the IF0 bit in the ESAI\_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

SCKR may be programmed as a disconnected pin (PC0) when the ESAI SCKR function is not being used. See [Table 25-13](#).

### NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal ESAI system clock, the external ESAI serial clock cannot exceed the internal ESAI system clock divided by 6.

For SCKR pin mode definitions, see [Table 25-10](#).

The table below provides a list of asynchronous-mode receiver clock sources. For more information about EXTAL/ESAI clocking control bits (ERI, ERO), refer to [ESAI Control Register \(ESAI\\_ECR\)](#).

**Table 25-1. Receiver Clock Sources (Asynchronous Mode Only)**

RHCKD	RFSD	RCKD	ERI	ERO	Receiver Bit Clock Source	OUTPUTS		
0	0	0	N/A	N/A	SCKR	-	-	-
0	0	1	N/A	N/A	HCKR	-	-	SCKR

EXTAL is the on-chip clock source other than ipg_clk_esai ESAI system clock, and it is from esai_clk_root in CCM.						

## 25.2.8 Transmitter Serial Clock

SCKT is a bidirectional pin providing the transmitters serial bit clock for the ESAI interface.

The direction of this pin is determined by the TCKD bit in the ESAI\_TCCR register. The SCKT is a clock input or output used by all the enabled transmitters in the asynchronous mode (SYN = 0) or by all the enabled transmitters and receivers in the synchronous mode (SYN = 1).

The following table provides a list of asynchronous-mode transmitter clock sources.

**Table 25-2. Transmitter Clock Sources (Asynchronous Mode Only)**

THCKD	TFSD	TCKD	ETI	ETO	Transmitter Bit Clock Source	OUTPUTS
0	0	0	N/A	N/A	SCKT	- - -
0	0	1	N/A	N/A	HCKT	- - SCKT
0	1	0	N/A	N/A	SCKT	- FST -

Table continues on the next page...

**Table 25-2. Transmitter Clock Sources (Asynchronous Mode Only)  
(continued)**

THCKD	TFSD	TCKD	ETI	ETO	Transmitter Bit Clock Source	OUTPUTS		
1	1	1	1	1	EXTAL	HCKT	FST	SCKT
Fsys = ipg_clk_esai								
EXTAL is the on-chip clock sources other than ipg_clk_easi ESAI system clock, and it is from esai_clk_root in CCM								

SCKT may be programmed as a disconnected pin (PC3) when the ESAI SCKT function is not being used. See [Table 25-13](#).

For more information about EXTAL/ESAI clocking control bits (ETI, ETO), see [ESAI Control Register \(ESAI\\_ECR\)](#).

#### NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal ESAI system clock, the external ESAI serial clock cannot exceed the internal ESAI system clock divided by 6.

### 25.2.9 Frame Sync for Receiver

FSR is a bidirectional pin providing the receivers frame sync signal for the ESAI interface. The direction of this pin is determined by the RFSD bit in ESAI\_RCR register.

In the asynchronous mode (SYN=0), the FSR pin operates as the frame sync input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as either the serial flag 1 pin (TEBE=0), or as the transmitter external buffer enable control (TEBE=1, RFSD=1). For FSR pin mode definitions, see [Table 25-11](#); for receiver clock signals, see [Table 25-1](#).

When this pin is configured as serial flag pin, its direction is determined by the RFSD bit in the ESAI\_RCCR register. When configured as the output flag OF1, this pin reflects the value of the OF1 bit in the ESAI\_SAICR register, and the data in the OF1 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF1, the data value at the pin is stored in the IF1 bit in the ESAI\_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

FSR may be programmed as a disconnected pin (PC1) when the ESAI FSR function is not being used. See [Table 25-13](#).

### 25.2.10 Frame Sync for Transmitter

FST is a bidirectional pin providing the frame sync for both the transmitters and receivers in the synchronous mode (SYN=1) and for the transmitters only in asynchronous mode (SYN=0).

See [Table 25-2](#). The direction of this pin is determined by the TFSD bit in the ESAI\_TCCR register. When configured as an output, this pin is the internally generated frame sync signal. When configured as an input, this pin receives an external frame sync signal for the transmitters (and the receivers in synchronous mode).

FST may be programmed as a disconnected pin (PC4) when the ESAI FST function is not being used. See [Table 25-13](#).

### 25.2.11 High Frequency Clock for Transmitter

HCKT is a bidirectional pin providing the transmitters high frequency clock for the ESAI interface.

The direction of this pin is determined by the THCKD bit in the ESAI\_TCCR register. In the asynchronous mode (SYN=0), the HCKT pin operates as the high frequency clock input or output used by all enabled transmitters. In the synchronous mode (SYN=1), it operates as the high frequency clock input or output used by all enabled transmitters and receivers. When programmed as input this pin is used as an alternative high frequency clock source to the ESAI transmitter rather than the ARM Core main clock. When programmed as output it can serve as a high frequency sample clock (to external DACs for example) or as an additional system clock (see [Table 25-2](#)).

HCKT may be programmed as a disconnected pin (PC5) when the ESAI HCKT function is not being used. See [Table 25-13](#).

### 25.2.12 High Frequency Clock for Receiver

HCKR is a bidirectional pin providing the receivers high frequency clock for the ESAI interface.

The direction of this pin is determined by the RHCKD bit in the ESAI\_RCCR register. In the asynchronous mode (SYN=0), the HCKR pin operates as the high frequency clock input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as the serial flag 2 pin. For HCKR pin mode definitions, see [Table 25-12](#); for receiver clock signals, see [Table 25-1](#).

When this pin is configured as serial flag pin, its direction is determined by the RHCKD bit in the ESAI\_RCCR register. When configured as the output flag OF2, this pin reflects the value of the OF2 bit in the ESAI\_SAICR register, and the data in the OF2 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF2, the data value at the pin is stored in the IF2 bit in the ESAI\_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

HCKR may be programmed as a disconnected pin (PC2) when the ESAI HCKR function is not being used. See [Table 25-13](#).

### 25.2.13 Serial I/O Flags

Three ESAI pins (FSR, SCKR and HCKR) are available as serial I/O flags when the ESAI is operating in the synchronous mode (SYN=1).

Their operation is controlled by RCKD, RFSD, TEBE bits in the ESAI\_RCR, ESAI\_RCCR and ESAI\_SAICR registers. The output data bits (OF2, OF1 and OF0) and the input data bits (IF2, IF1 and IF0) are double buffered to/from the HCKR, FSR and SCKR pins. Double buffering the flags keeps them in sync with the TX and RX data lines.

Each flag can be separately programmed. Flag 0 (SCKR pin) direction is selected by RCKD, RCKD=1 for output and RCKD=0 for input. Flag 1 (FSR pin) is enabled when the pin is not configured as external transmitter buffer enable (TEBE=0) and its direction is selected by RFSD, RFSD=1 for output and RFSD=0 for input. Flag 2 (HCKR pin) direction is selected by RHCKD, RHCKD=1 for output and RHCKD=0 for input.

When programmed as input flags, the SCKR, FSR and HCKR logic values, respectively, are latched at the same time as the first bit of the receive data word is sampled. Because the input was latched, the signal on the input flag pin (SCKR, FSR or HCKR) can change without affecting the input flag until the first bit of the next receive data word. When the received data words are transferred to the receive data registers, the input flag latched values are then transferred to the IF0, IF1 and IF2 bits in the SAISR register, where they may be read by software.

When programmed as output flags, the SCKR, FSR and HCKR logic values are driven by the contents of the OF0, OF1 and OF2 bits in the ESAI\_SAICR register respectively, and they are driven when the transmit data registers are transferred to the transmit shift registers. The value on SCKR, FSR and HCKR is stable from the time the first bit of the transmit data word is transmitted until the first bit of the next transmit data word is transmitted. Software may change the OF0-OF2 values thus controlling the SCKR, FSR and HCKR pin values for each transmitted word. The normal sequence for setting output flags when transmitting data is as follows: wait for TDE (transmitter empty) to be set; first write the flags, and then write the transmit data to the transmit registers. OF0, OF1, and OF2 are double buffered so that the flag states appear on the pins when the transmit data is transferred to the transmit shift register, that is, the flags are synchronous with the data.

## 25.3 Clocks

The table found here describes the clock sources for ESAI.

Please see clock control block for clock setting, configuration and gating information.

**Table 25-3. ESAI Clocks**

Clock name	Clock Root	Description
extal_clk	esai_clk_root	ESAI system clock
ipg_clk_esai	ahb_clk_root	Bus clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_clk	ahb_clk_root	Mem clock

## 25.4 Functional Description

This section provides a complete functional description of the block.

### 25.4.1 ESAI After Reset

Hardware or software reset clears the port control register bits and the port direction control register bits, which configure all ESAI I/O pins as disconnected and both ESAI FIFOs are also in reset state.

The ESAI is in personal reset state while all ESAI pins are programmed as disconnected, and it is active only if at least one of the ESAI I/O pins is programmed as an ESAI pin.

## 25.4.2 ESAI Interrupt Requests

The ESAI can generate eight different interrupt requests.

Ordered from the highest to the lowest priority):

### 1. ESAI Receive Data with Exception Status

Occurs when the receive exception interrupt is enabled (REIE=1 in the RCR register), at least one of the enabled receive data registers is full (RDF=1) and a receiver overrun error has occurred (ROE=1 in the SAISR register). ROE is cleared by first reading the SAISR and then reading all the enabled receive data registers.

### 2. ESAI Receive Even Data

Occurs when the receive even slot data interrupt is enabled (REDIE=1), at least one of the enabled receive data registers is full (RDF=1), the data is from an even slot (REDF=1) and no exception has occurred (ROE=0 or REIE=0).

Reading all enabled receiver data registers clears RDF and REDF.

### 3. ESAI Receive Data

Occurs when the receive interrupt is enabled (RIE=1), at least one of the enabled receive data registers is full (RDF=1), no exception has occurred (ROE=0 or REIE=0) and no even slot interrupt has occurred (REDF=0 or REDIE=0). Reading all enabled receiver data registers clears RDF.

### 4. ESAI Receive Last Slot Interrupt

Occurs, if enabled (RLIE=1), after the last slot of the frame ended (in network mode only) regardless of the receive mask register setting. The receive last slot interrupt may be used for resetting the receive mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the receive last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum receive last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

### 5. ESAI Transmit Data with Exception Status

Occurs when the transmit exception interrupt is enabled (TEIE=1), at least one transmit data register of the enabled transmitters is empty (TDE=1) and a transmitter underrun error has occurred (TUE=1). TUE is cleared by first reading the SAISR and then writing to all the enabled transmit data registers, or to the TSR register.

## 6. ESAI Transmit Last Slot Interrupt

Occurs, if enabled (TLIE=1), at the start of the last slot of the frame in network mode regardless of the transmit mask register setting. The transmit last slot interrupt may be used for resetting the transmit mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the transmit last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum transmit last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

## 7. ESAI Transmit Even Data

Occurs when the transmit even slot data interrupt is enabled (TEDIE=1), at least one of the enabled transmit data registers is empty (TDE=1), the slot is an even slot (TEDE=1) and no exception has occurred (TUE=0 or TEIE=0). Writing to all the TX registers of the enabled transmitters or to TSR clears this interrupt request.

## 8. ESAI Transmit Data

Occurs when the transmit interrupt is enabled (TIE=1), at least one of the enabled transmit data registers is empty (TDE=1), no exception has occurred (TUE=0 or TEIE=0) and no even slot interrupt has occurred (TEDE=0 or TEDIE=0). Writing to all the TX registers of the enabled transmitters, or to the TSR clears this interrupt request.

### 25.4.3 ESAI DMA Requests from the FIFOs

The ESAI can generate two different DMA requests:

1. ESAI Transmit FIFO Empty - Asserts when the number of empty slots in the ESAI transmit FIFO exceeds the threshold programmed in the ESAI Transmit FIFO Configuration Register (TFCR). Automatically negates when the number of empty slots is less than the threshold programmed in the ESAI Transmit FIFO Configuration Register.
2. ESAI Receive FIFO Full - Asserts when the number of data words in the ESAI receive FIFO exceeds the threshold programmed in the ESAI Receive FIFO Configuration Register (RFCR). Automatically negates when the number of words is less than the threshold programmed in the ESAI Receive FIFO Configuration Register.

## 25.4.4 ESAI Transmit and Receive Shift Registers

### 25.4.4.1 ESAI Transmit Shift Registers

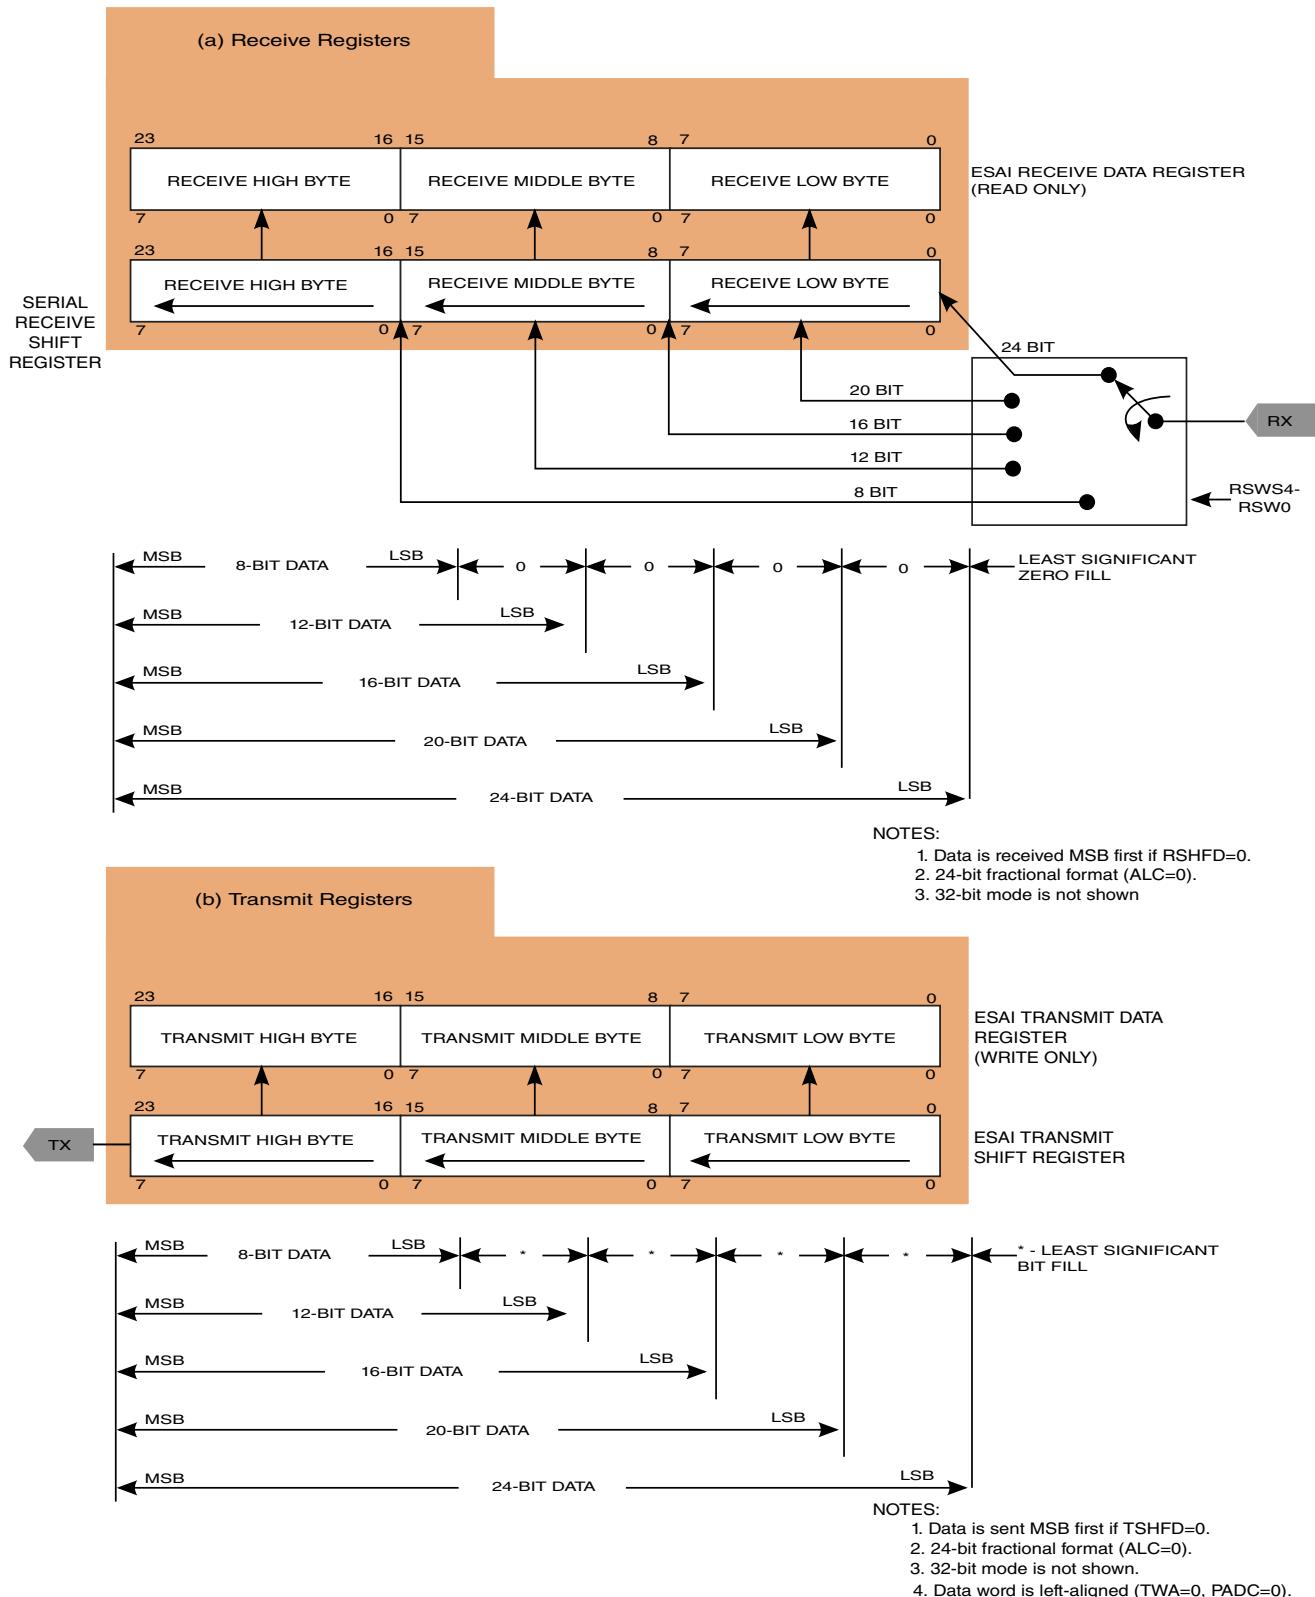

The transmit shift registers contain the data being transmitted.

See [Figure 25-2](#) and [Figure 25-3](#).

Data is shifted out to the serial transmit data pins by the selected (internal/external) bit clock when the associated frame sync I/O is asserted.

The number of bits shifted out before the shift registers are considered empty and may be written to again can be 8, 12, 16, 20, 24 or 32 bits (determined by the slot length control bits in the TCR register). Data is shifted out of these registers MSB first if TSHFD=0 and LSB first if TSHFD=1.

## Functional Description

**Figure 25-2. ESAI Data Path Programming Model ([R/T]SHFD=0)**

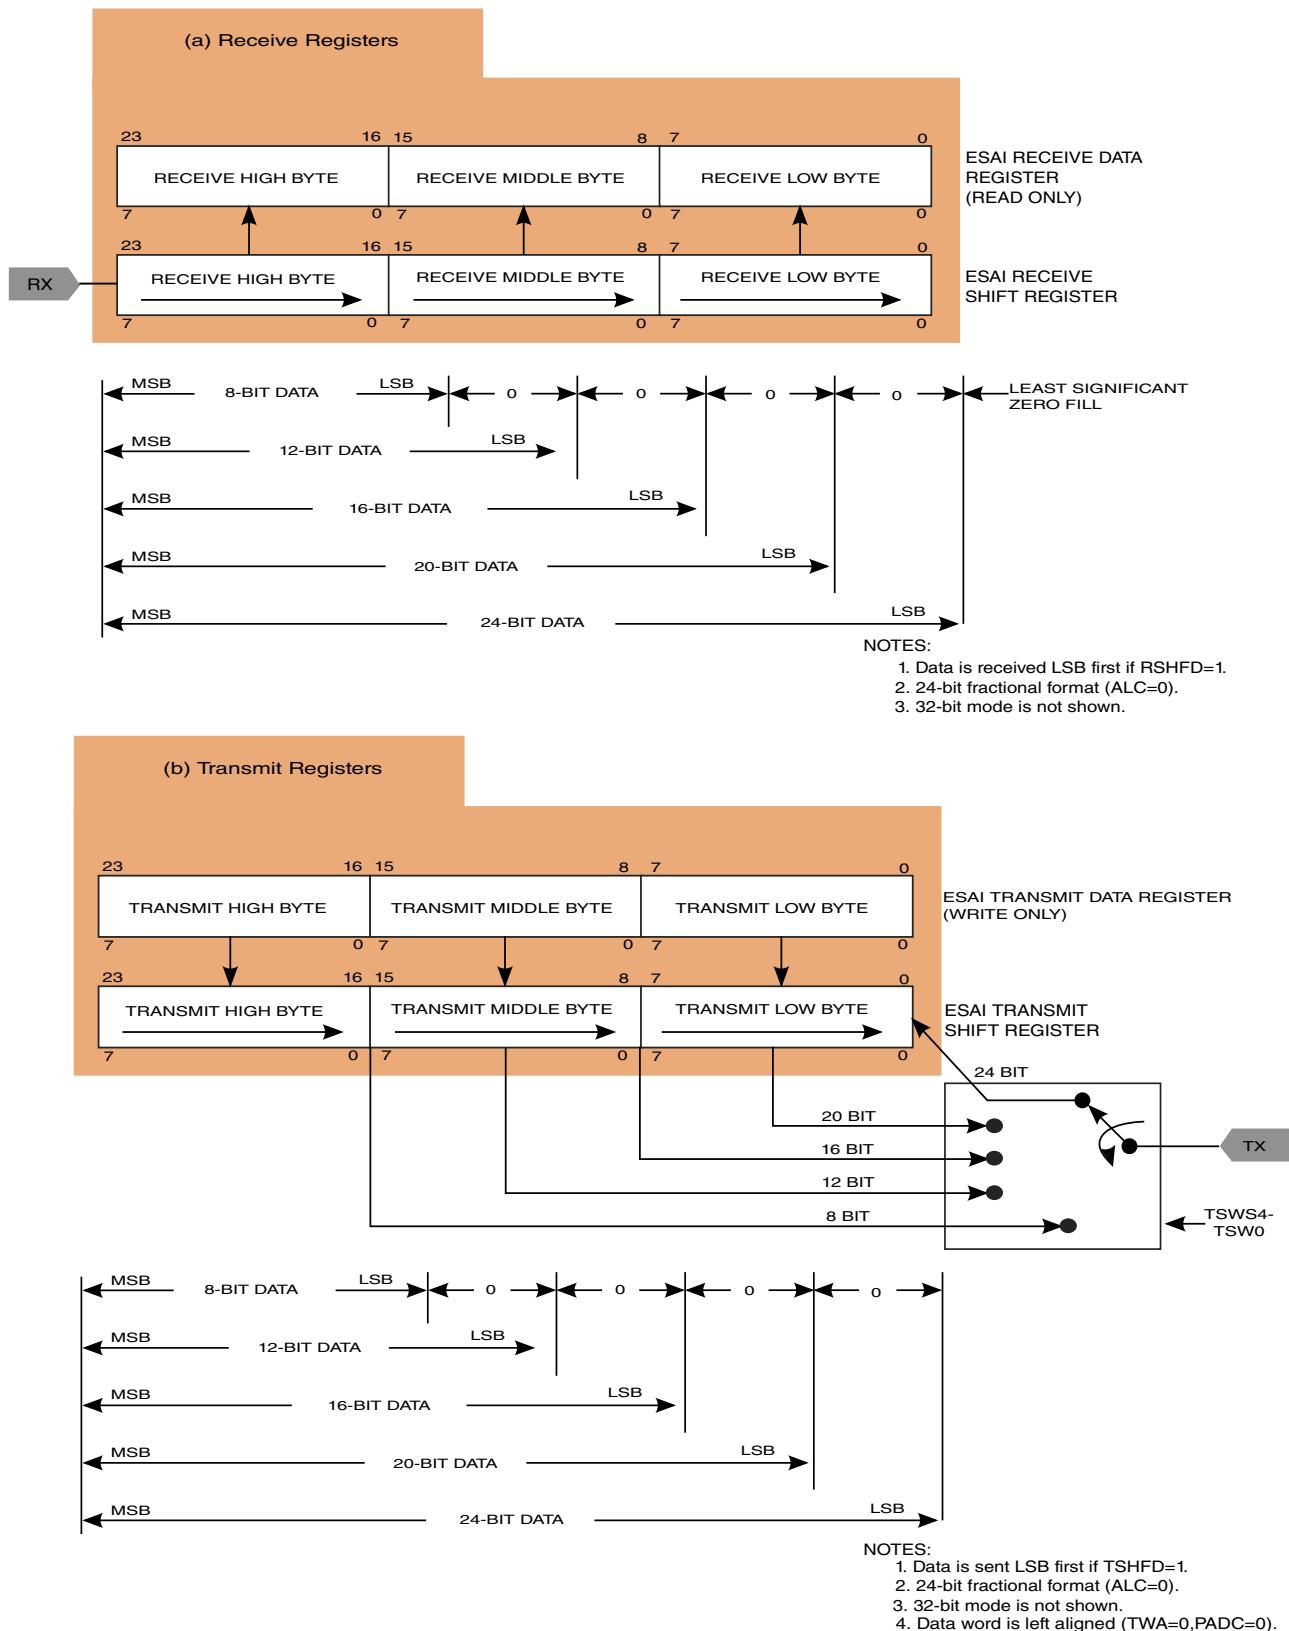

Figure 25-3. ESAI Data Path Programming Model ([R/T]SHFD=1)

### 25.4.4.2 ESAI Receive Shift Registers

The receive shift registers ([Figure 25-2](#) and [Figure 25-3](#)) receive the incoming data from the serial receive data pins. Data is shifted in by the selected (internal/external) bit clock when the associated frame sync I/O is asserted. Data is assumed to be received MSB first if RSHFD=0 and LSB first if RSHFD=1. Data is transferred to the ESAI receive data registers after 8, 12, 16, 20, 24, or 32 serial clock cycles were counted, depending on the slot length control bits in the `ESAI_RCR` register.

## 25.5 Initialization Information

### 25.5.1 ESAI Initialization

The correct way to initialize the ESAI is as follows:

1. Enable the ESAI logic clock by asserting bit 0 of ESAI Control Register (`ESAI_ECR[0]`).
2. Hardware, software, ESAI individual reset. Note that asserting bit 1 of ESAI Control Register only reset the ESAI core logic, including configuration registers, but not the ESAI FIFOs.
3. Reset ESAI FIFOs by asserting bit 1 of `ESAI_TFCR` and `ESAI_RFCR`.
4. Clear the `ESAI_TSMA`/`ESAI_TSMB`.
5. Program ESAI control registers. (The transmit/receive enable bits of `TCR`/`RCR` should not be set.)
6. Program ESAI FIFOs via `TFCR` and `RFCR`. (Enable Transmit/Receive FIFO, enable transmitters/receivers, transmit initialization and set Transmit FIFO/Receive FIFO watermark.)
7. Write initial words to ESAI Transmit Data Register (`ESAI_ETDR`), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into `ESAI_ETDR`
8. Remove ESAI personal reset by configuring `ESAI_PCRC` and `ESAI_PRRC`.
9. Enabled Transmitters/Receivers in `ESAI_TCR`/`ESAI_RCR`.
10. Configure time slot registers, first set `ESAI_TSMB`, then `ESAI_TSMA`.

During program execution, all ESAI pins may be defined disconnected, causing the ESAI to stop serial activity and enter the individual reset state.

All status bits of the interface are set to their reset state however, the control bits are not affected. This procedure allows the programmer to reset the ESAI separately from the other internal peripherals. During individual reset, internal DMA accesses to the data registers of the ESAI are not valid and data read is undefined.

The programmer must use an individual ESAI reset when changing the ESAI control registers (except for TEIE, REIE, TLIE, RLIE, TIE, RIE, TE0-TE5, RE0-RE3) to ensure proper operation of the interface.

### **NOTE**

If the ESAI receiver section is already operating with some of the receivers and enabling additional receivers on the fly, that is, without first putting the ESAI receiver in the personal reset state by setting their REx control bits, it will result in erroneous data being received as the first data word for the newly enabled receivers.

## **25.5.2 ESAI Initialization Examples**

### **25.5.2.1 Initializing the ESAI using Personal Reset**

1. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI\_ECR[0]).
2. The ESAI should be in its personal reset state (ESAI\_PCRC = 0x000 and ESAI\_PRRC = 0x000). In the personal reset state, both the transmitter and receiver sections of the ESAI are simultaneously reset. The TPR bit in the ESAI\_TCR register may be used to reset just the transmitter section. The RPR bit in the ESAI\_RCR register may be used to reset just the receiver section.
3. Clear the ESAI\_TSMA/ESAI\_TSMB and ESAI\_RSMA/ESAI\_RSMB.
4. Configure the control registers (ESAI\_TCCR, ESAI\_TCR, ESAI\_RCCR, ESAI\_RCR) and ESAI FIFOs configuration Registers (ESAI\_TFCR, ESAI\_RFRCR) according to the operating mode, but do not enable transmitters (TE5-TE0 = 0x0) or receivers (RE3-RE0 = 0x0). It is possible to set the interrupt enable bits which are in use during the operation (no interrupt occurs).
5. Enable the ESAI by setting the ESAI\_PCRC and ESAI\_PRRC register bits according to pins which are in use during operation.
6. Write initial words to ESAI Transmit Data Register (ESAI\_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI\_ETDR. This step is needed even if DMA is used to service the transmitters.
7. Enable the transmitters and receivers.

8. Configure time slot registers, first set ESAI\_TSMB, then ESAI\_TSMA, then ESAI\_RSMB, then ESAI\_RSMA.
9. From now on ESAI can be serviced either by polling, interrupts, or DMA.

Operation proceeds as follows:

- For internally generated clock and frame sync, these signals are active immediately after ESAI is enabled (step 4 above).
- Data is received only when one of the receive enable (REx) bits is set and after the occurrence of frame sync signal (either internally or externally generated).
- Data is transmitted only when the transmitter enable (TEx) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TEx bit is set until the frame sync occurs.

### **25.5.2.2 Initializing the ESAI Transmitter Section**

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI\_ECR[0])
3. The transmitter section should be in its individual reset state (TPR = 1) and also reset the ESAI Transmit FIFO (ESAI\_TFCR[1] = 1).
4. Clear the ESAI\_TSMA/ESAI\_TSMB.
5. Configure the control registers ESAI\_TCCR and ESAI\_TCR according to the operating mode, configure the Transmit FIFO Configuration Register (bring transmit FIFO out of reset, enable Transmit FIFO, enable transmitters, transmit initialization and set watermark). Make sure to clear the transmitter enable bits (TE0-TE5). TPR must remain set.
6. Take the transmitter section out of the individual reset state by clearing TPR.
7. Write initial words to ESAI Transmit Data Register (ESAI\_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI\_ETDR
8. Enable the transmitters by setting their TE bits.
9. Configure time slot registers, first set ESAI\_TSMB, then ESAI\_TSMA.
10. Data is transmitted only when the transmitter enable (TEx) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TEx bit is set until the frame sync occurs.
11. From now on the transmitters are operating and can be serviced either by polling, interrupts, or DMA.

### 25.5.2.3 Initializing the ESAI Receiver Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register (ESAI\_ECR[0])
3. The receiver section should be in its individual reset state (RPR = 1) and also reset the ESAI Receive FIFO (ESAI\_RFCR[1] = 1).
4. Clear the ESAI\_RSMA/ESAI\_RSMB.
5. Configure the control registers ESAI\_RCCR and ESAI\_RCR according to the operating mode, configure the Receive FIFO Configuration Register (bring receive FIFO out of reset, enable Receive FIFO, receivers, and set watermark). Making sure to clear the receiver enable bits (RE0-RE3). RPR must remain set.
6. Take the receiver section out of the individual reset state by clearing RPR.
7. Enable the receivers by setting their RE bits.
8. Configure time slot registers, first set ESAI\_RSMB, then set ESAI\_RSMA.
9. From now on the receivers are operating and can be serviced either by polling, interrupts, or DMA.

## 25.6 ESAI Memory Map/Register Definition

**ESAI memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
202_4000	ESAI Transmit Data Register (ESAI_ETDR)	32	W (always reads 0)	0000_0000h	<a href="#">25.6.1/1203</a>

**25.6.1 ESAI Transmit Data Register (ESAI\_ETDR)**

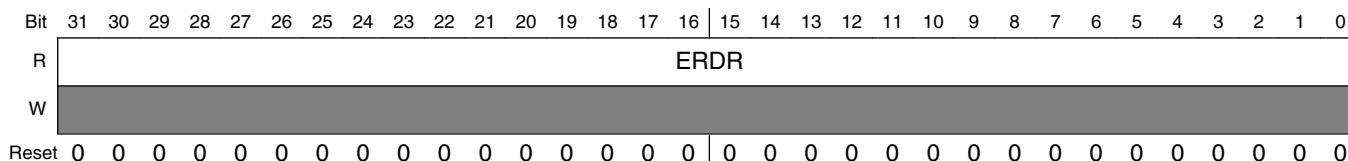

Address: 202\_4000h base + 0h offset = 202\_4000h

**ESAI\_ETDR field descriptions**

Field	Description
ETDR	ESAI Transmit Data Register. Writing to this register stores the data written into the ESAI Transmit FIFO. Writing to this register when the Transmit FIFO is full causes the data written to be lost (the existing data within the FIFO is not overwritten). When multiple ESAI transmitters are enabled, the data for each transmitter must be interleaved from lowest transmitter to highest transmitter (for example, if transmitters 0, 2 and 3 are enabled then data must be written as follows: transmitter #0, transmitter #2, transmitter #3, transmitter #0, transmitter #2, transmitter #3, transmitter #0, etc). Data within the ESAI Transmit FIFO is passed to the ESAI transmit shifter registers as defined by the Transmit Word Alignment configuration bits.

**25.6.2 ESAI Receive Data Register (ESAI\_ERDR)**

Address: 202\_4000h base + 4h offset = 202\_4004h

**ESAI\_ERDR field descriptions**

Field	Description
ERDR	ESAI Receive Data Register. Reading this register returns the data within the ESAI Receive FIFO. Reading this register when the Receive FIFO is empty returns the last valid data word. When multiple ESAI receivers are enabled, the data for each receiver is interleaved from lowest receiver to highest receiver (for example, if receivers 0, 2 and 3 are enabled then data is returned as follows: receiver #0, receiver #2, receiver #3, receiver #0, receiver #2, receiver #3, receiver #0, etc). Data is passed from the ESAI receive shift registers to the ESAI Receive FIFO as defined by the Receiver Word Alignment configuration bits either zero or sign-extended based on the Receive Extension control bit.

### 25.6.3 ESAI Control Register (ESAI\_ECR)

Address: 202\_4000h base + 8h offset = 202\_4008h

#### ESAI\_ECR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 ETI	EXTAL Transmitter In. Mux EXTAL in place of the High Frequency Transmitter Clock input pin. HCKT can still be used to drive a divided down EXTAL or as GPIO.  0 HCKT pin has normal function. 1 EXTAL muxed into HCKT input.
18 ETO	EXTAL Transmitter Out. Drive the EXTAL input on the High Frequency Transmitter Clock pin.  0 HCKT pin has normal function. 1 EXTAL driven onto HCKT pin.
17 ERI	EXTAL Receiver In. Mux EXTAL in place of the High Frequency Receiver Clock input pin. HCKR can still be used to drive a divided down EXTAL or as GPIO.  0 HCKR pin has normal function. 1 EXTAL muxed into HCKR input.
16 ERO	EXTAL Receiver Out. Drive the EXTAL input on the High Frequency Receiver Clock pin.  0 HCKR pin has normal function. 1 EXTAL driven onto HCKR pin.
15–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 ERST	ESAI Reset. Reset the ESAI core logic (including configuration registers) but not the ESAI FIFOs.  0 ESAI not reset. 1 ESAI reset.
0 ESAIEN	ESAI Enable. Enables/disables the ESAI logic clock. Enable the ESAI before reading or writing other ESAI registers.

Table continues on the next page...

**ESAI\_ECR field descriptions (continued)**

Field	Description
	0 ESAI disabled. 1 ESAI enabled.

**25.6.4 ESAI Status Register (ESAI\_ESR)**

Address: 202\_4000h base + Ch offset = 202\_400Ch

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R									0								
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R				0		TINIT	RFF	TFE	TLS	TDE	TED	TD	RLS	RDE	RED	RD	
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ESAI\_ESR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 TINIT	Transmit Initialization. Indicates that the Transmit FIFO is writing the first word for each enabled transmitter into the Transmit Data Registers. This bit sets when the Transmit FIFO is enabled (provided Transmit Initialization is enabled) and clears after the Transmit Data Registers have been initialized. The Transmit Enable bits in the Transmit Control Register should not be set until this flag has cleared.  0 Transmitter has finished initializing the Transmit Data Registers (or Transmit FIFO is not enabled or Transmit Initialization is not enabled). 1 Transmitter has not finished initializing the Transmit Data Registers.
9 RFF	Receive FIFO Full. Indicates that the number of data words in the Receive FIFO has equaled or exceeded the Receive FIFO Watermark. This flag also drives the ESAI Receiver DMA request line. ESAI FIFO DMA requests see <a href="#">ESAI DMA Requests from the FIFOs</a> .  0 Number of words in Receive FIFO less than Receive FIFO watermark. 1 Number of words in Receive FIFO is equal to or greater than Receive FIFO watermark.
8 TFE	Transmit FIFO Empty. Indicates that the number of empty slots in the Transmit FIFO has met or exceeded the Transmit FIFO Watermark. This flag also drives the ESAI Transmitter DMA request line. ESAI FIFO DMA request see <a href="#">ESAI DMA Requests from the FIFOs</a> .  0 Number of empty slots in Transmit FIFO less than Transmit FIFO watermark. 1 Number of empty slots in Transmit FIFO is equal to or greater than Transmit FIFO watermark.
7 TLS	Transmit Last Slot. Reading this register when TLS is set will negate the Transmit Last Slot interrupt.  0 TLS is not the highest priority active interrupt. 1 TLS is the highest priority active interrupt.

*Table continues on the next page...*

**ESAI\_ESR field descriptions (continued)**

Field	Description
6 TDE	Transmit Data Exception.  0 TDE is not the highest priority active interrupt. 1 TDE is the highest priority active interrupt.
5 TED	Transmit Even Data.  0 TED is not the highest priority active interrupt. 1 TED is the highest priority active interrupt.
4 TD	Transmit Data.  0 TD is not the highest priority active interrupt. 1 TD is the highest priority active interrupt.
3 RLS	Receive Last Slot. Reading this register when RLS is set will negate the Receive Last Slot interrupt.  0 RLS is not the highest priority active interrupt. 1 RLS is the highest priority active interrupt.
2 RDE	Receive Data Exception.  0 RDE is not the highest priority active interrupt. 1 RDE is the highest priority active interrupt.
1 RED	Receive Even Data.  0 RED is not the highest priority active interrupt. 1 RED is the highest priority active interrupt.
0 RD	Receive Data.  0 RD is not the highest priority active interrupt. 1 RD is the highest priority active interrupt.

**25.6.5 Transmit FIFO Configuration Register (ESAI\_TFCR)**

Address: 202\_4000h base + 10h offset = 202\_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R									0							
W											TFIN	TAENB	TIEN		TWA	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R									TFWM	TE5	TE4	TE3	TE2	TE1	TE0	TFR
W										0	0	0	0	0	0	0
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ESAI\_TFCR field descriptions**

Field	Description
31–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 TFIN	Tx FIFO Interrupt Enable  Generate an interrupt if the "Tx FIFO Empty" flag is set. Indicate the number of empty slots in the Tx FIFO has met or exceed watermark.
20 TAENB	Tx FIFO Align Enable  Disable Tx FIFO slot align function when set.
19 TIEN	Transmitter Initialization Enable. Enables the initialization of the Transmit Data Registers when the Transmitter FIFO is enabled. TIEN=1 is recommended.  0 Transmit Data Registers are not initialized from the FIFO once the Transmit FIFO is enabled. Software must manually initialize the Transmit Data Registers separately. 1 Transmit Data Registers are initialized from the FIFO once the Transmit FIFO is enabled.
18–16 TWA	Transmit Word Alignment. Configures the alignment of the data written into the ESAI Transmit Data Register and then passed to the relevant 24 bit Transmit shift register.  <b>NOTE:</b> The settings shown below assume TCR[TWA]=0, TCR[PADC]=1 and TCR[TSHFD]=0.  000 MSB of data is bit 31. Data bits 7-0 are ignored when passed to transmit shift register. 001 MSB of data is bit 27. Data bits 3-0 are ignored when passed to transmit shift register. 010 MSB of data is bit 23. 011 MSB of data is bit 19. Bottom 4 bits of transmit shift register are zeroed. 100 MSB of data is bit 15. Bottom 8 bits of transmit shift register are zeroed. 101 MSB of data is bit 11. Bottom 12 bits of transmit shift register are zeroed. 110 MSB of data is bit 7. Bottom 16 bits of transmit shift register are zeroed. 111 MSB of data is bit 3. Bottom 20 bits of transmit shift register are zeroed.
15–8 TFWM	Transmit FIFO Watermark. These bits configure the threshold at which the Transmit FIFO Empty flag will set. The TFE is set when the number of empty slots in the Transmit FIFO equal or exceed the selected threshold.
7 TE5	Transmitter #5 FIFO Enable. This bit enables transmitter #5 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #5 is not using the Transmit FIFO. 1 Transmitter #5 is using the Transmit FIFO.
6 TE4	Transmitter #4 FIFO Enable. This bit enables transmitter #4 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #4 is not using the Transmit FIFO. 1 Transmitter #4 is using the Transmit FIFO.
5 TE3	Transmitter #3 FIFO Enable. This bit enables transmitter #3 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #3 is not using the Transmit FIFO. 1 Transmitter #3 is using the Transmit FIFO.
4 TE2	Transmitter #2 FIFO Enable. This bit enables transmitter #2 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #2 is not using the Transmit FIFO. 1 Transmitter #2 is using the Transmit FIFO.

*Table continues on the next page...*

**ESAI\_TFCR field descriptions (continued)**

Field	Description
3 TE1	Transmitter #1 FIFO Enable. This bit enables transmitter #1 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #1 is not using the Transmit FIFO. 1 Transmitter #1 is using the Transmit FIFO.
2 TE0	Transmitter #0 FIFO Enable. This bit enables transmitter #0 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.  0 Transmitter #0 is not using the Transmit FIFO. 1 Transmitter #0 is using the Transmit FIFO.
1 TFR	Transmit FIFO Reset. This bit resets the Transmit FIFO pointers.  0 Transmit FIFO not reset. 1 Transmit FIFO reset.
0 TFE	Transmit FIFO Enable. This bit enables the use of the Transmit FIFO.  0 Transmit FIFO disabled. 1 Transmit FIFO enabled.

**25.6.6 Transmit FIFO Status Register (ESAI\_TFSR)**

Address: 202\_4000h base + 14h offset = 202\_4014h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

**ESAI\_TFSR field descriptions**

Field	Description
31–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–12 NTFO	Next Transmitter FIFO Out. Indicates which Transmit Data Register receives the top word of the Transmit FIFO. This will usually equal the lowest enabled transmitter, unless the transmit FIFO is empty.  000 Transmitter #0 receives next word from the Transmit FIFO. 001 Transmitter #1 receives next word from the Transmit FIFO. 010 Transmitter #2 receives next word from the Transmit FIFO. 011 Transmitter #3 receives next word from the Transmit FIFO.

*Table continues on the next page...*

**ESAI\_TFSR field descriptions (continued)**

Field	Description
	100 Transmitter #4 receives next word from the Transmit FIFO. 101 Transmitter #5 receives next word from the Transmit FIFO. 110 Reserved. 111 Reserved.
11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 NTFI	Next Transmitter FIFO In. Indicates which transmitter receives the next word written to the FIFO.  000 Transmitter #0 receives next word written to the Transmit FIFO. 001 Transmitter #1 receives next word written to the Transmit FIFO. 010 Transmitter #2 receives next word written to the Transmit FIFO. 011 Transmitter #3 receives next word written to the Transmit FIFO. 100 Transmitter #4 receives next word written to the Transmit FIFO. 101 Transmitter #5 receives next word written to the Transmit FIFO. 110 Reserved. 111 Reserved.
TFCNT	Transmit FIFO Counter. These bits indicate the number of data words stored in the Transmit FIFO.

**25.6.7 Receive FIFO Configuration Register (ESAI\_RFCR)**

Address: 202\_4000h base + 18h offset = 202\_4018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**ESAI\_RFCR field descriptions**

Field	Description
31–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 RFIN	Rx FIFO Interrupt Enable  Generate an interrupt if the "Rx FIFO Empty" flag is set. Indicate the number of data in the Rx FIFO has met or exceed water mark.

*Table continues on the next page...*

**ESAI\_RFCR field descriptions (continued)**

Field	Description
20 RAENB	Rx FIFO Align Enable  Disable Rx FIFO slot align function when set.
19 REXT	Receive Extension. Enables the receive data to be returned sign extended when the Receive Word Alignment is configured to return data where the MSB is not aligned with bit 31.  0 Receive data is zero extended. 1 Receive data is sign extended.
18–16 RWA	Receive Word Alignment. Configures the alignment of the data passed from the relevant 24 bit Receive shift register and read out the ESAI Receive Data Register.  000 MSB of data is at bit 31. Data bits 7-0 are zeroed. 001 MSB of data is at bit 27. Data bits 3-0 are zeroed. 010 MSB of data is at bit 23. 011 MSB of data is at bit 19. Data bits 3-0 from receive shift register are ignored. 100 MSB of data is at bit 15. Data bits 7-0 from receive shift register are ignored. 101 MSB of data is at bit 11. Data bits 11-0 from receive shift register are ignored. 110 MSB of data is at bit 7. Data bits 15-0 from receive shift register are ignored. 111 MSB of data is at bit 3. Data bits 19-0 from receive shift register are ignored.
15–8 RFWM	Receive FIFO Watermark. These bits configure the threshold at which the Receive FIFO Full flag will set. The RFF is set when the number of words in the Receive FIFO equal or exceed the selected threshold. It can be set to a non-zero value.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5 RE3	Receiver #3 FIFO Enable. This bit enables receiver #3 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #3 is not using the Receive FIFO. 1 Receiver #3 is using the Receive FIFO.
4 RE2	Receiver #2 FIFO Enable. This bit enables receiver #2 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #2 is not using the Receive FIFO. 1 Receiver #2 is using the Receive FIFO.
3 RE1	Receiver #1 FIFO Enable. This bit enables receiver #1 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #1 is not using the Receive FIFO. 1 Receiver #1 is using the Receive FIFO.
2 RE0	Receiver #0 FIFO Enable. This bit enables receiver #0 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled.  0 Receiver #0 is not using the Receive FIFO. 1 Receiver #0 is using the Receive FIFO.
1 RFR	Receive FIFO Reset. This bit resets the Receive FIFO pointers.  0 Receive FIFO not reset. 1 Receive FIFO reset.
0 RFE	Receive FIFO Enable. This bit enables the use of the Receive FIFO.

*Table continues on the next page...*

**ESAI\_RFCR field descriptions (continued)**

Field	Description
	0 Receive FIFO disabled. 1 Receive FIFO enabled.

**ESAI\_RFSR field descriptions**

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13–12 NRFI	Next Receiver FIFO In. Indicates which Receiver Data Register the Receive FIFO will load next. This will usually equal the lowest enabled receiver, unless the receive FIFO is full.  00 Receiver #0 returns next word to the Receive FIFO. 01 Receiver #1 returns next word to the Receive FIFO. 10 Receiver #2 returns next word to the Receive FIFO. 11 Receiver #3 returns next word to the Receive FIFO.
11–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–8 NRFO	Next Receiver FIFO Out. Indicates which receiver returns the top word of the Receive FIFO.  00 Receiver #0 returns next word from the Receive FIFO. 01 Receiver #1 returns next word from the Receive FIFO. 10 Receiver #2 returns next word from the Receive FIFO. 11 Receiver #3 returns next word from the Receive FIFO.
RFCNT	Receive FIFO Counter. These bits indicate the number of data words stored in the Receive FIFO.

## 25.6.9 Transmit Data Register n (ESAI\_TXn)

ESAI\_TX5, ESAI\_TX4, ESAI\_TX3, ESAI\_TX2, ESAI\_TX1 and ESAI\_TX0 are 32-bit write-only registers. Data to be transmitted is written into these registers and is automatically transferred to the transmit shift registers (Figure 25-2 and Figure 25-3). The data written (8, 12, 16, 20, or 24 bits) should occupy the most significant portion of the TXn according to the ALC control bit setting. The unused bits (least significant portion and the 8 most significant bits when ALC=1) of the TXn are don't care bits. The Core is interrupted whenever the TXn becomes empty if the transmit data register empty interrupt has been enabled.

Address: 202\_4000h base + 80h offset + (4d × i), where i=0d to 5d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ESAI\_TSR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

### ESAI\_TSR field descriptions (continued)

Field	Description
TSR	The write-only Transmit Slot Register (ESAI_TSR) is effectively a null data register that is used when the data is not to be transmitted in the available transmit time slot. The transmit data pins of all the enabled transmitters are in the high-impedance state for the respective time slot where TSR has been written. The Transmitter External Buffer Enable pin (FSR pin when SYN=1, TEBE=1, RFSD=1) disables the external buffers during the slot when the ESAI_TSR register has been written.

### 25.6.11 Receive Data Register n (ESAI\_RXn)

ESAI\_RX3, ESAI\_RX2, ESAI\_RX1, and ESAI\_RX0 are 32-bit read-only registers that accept data from the receive shift registers when they become full ([Figure 25-2](#) and [Figure 25-3](#)). The data occupies the most significant portion of the receive data registers, according to the ALC control bit setting. The unused bits (least significant portion and 8 most significant bits when ALC=1) read as zeros. The Core is interrupted whenever RXn becomes full if the associated interrupt is enabled.

RXn	Accept data from the receive shift registers when they become full See <a href="#">ESAI Receive Shift Registers</a>

## 25.6.12 Serial Audio Interface Status Register (ESAI\_SAISR)

The Status Register (ESAI\_SAISR) is a read-only status register used by the ARM Core to read the status and serial input flags of the ESAI.

Address: 202\_4000h base + CCh offset = 202\_40CCh

### ESAI\_SAISR field descriptions

Field	Description
31–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 TDFE	ESAI_SAISR Transmit Odd-Data Register Empty. When set, TDFE indicates that the enabled transmitter data registers became empty at the beginning of an odd time slot. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TDFE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TS). TODE is cleared when the Core writes to all the transmit data registers of the

*Table continues on the next page...*

**ESAI\_SAISR field descriptions (continued)**

Field	Description
	enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TODFE is set. Hardware, software, ESAI individual reset clear TODFE.
16 TEDE	ESAI_SAISR Transmit Even-DataRegister Empty. When set, TEDE indicates that the enabled transmitter data registers became empty at the beginning of an even time slot. Even time slots are all even-numbered slots (0, 2, 4, 6, etc.). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TEDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TEDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TEDE is set. Hardware, software, ESAI individual reset clear TEDE.
15 TDE	ESAI_SAISR Transmit Data Register Empty. TDE is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TDE is set. Hardware, software, ESAI individual reset clear TDE.
14 TUE	ESAI_SAISR Transmit Underrun Error Flag. TUE is set when at least one of the enabled serial transmit shift registers is empty (no new data to be transmitted) and a transmit time slot occurs. When a transmit underrun error occurs, the previous data (which is still present in the TX registers that were not written) is retransmitted. If TEIE is set, an ESAI transmit data with exception (underrun error) interrupt request is issued when TUE is set. Hardware, software, ESAI individual reset clear TUE. TUE is also cleared by reading the ESAI_SAISR with TUE set, followed by writing to all the enabled transmit data registers or to ESAI_TSR.
13 TFS	ESAI_SAISR Transmit Frame Sync Flag. When set, TFS indicates that a transmit frame sync occurred in the current time slot. TFS is set at the start of the first time slot in the frame and cleared during all other time slots. Data written to a transmit data register during the time slot when TFS is set is transmitted (in network mode), if the transmitter is enabled, during the second time slot in the frame. TFS is useful in network mode to identify the start of a frame. TFS is cleared by hardware, software, ESAI individual reset. TFS is valid only if at least one transmitter is enabled, that is, one or more of TE0, TE1, TE2, TE3, TE4 and TE5 are set. (In normal mode, TFS always reads as a one when transmitting data because there is only one time slot per frame - the "frame sync" time slot)
12–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 RODF	ESAI_SAISR Receive Odd-Data Register Full. When set, RODF indicates that the received data in the receive data registers of the enabled receivers have arrived during an odd time slot when operating in the network mode. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. RODF is set when the contents of the receive shift registers are transferred to the receive data registers. RODF is cleared when the Core reads all the enabled receive data registers or cleared by hardware, software, ESAI individual resets.
9 REDF	ESAI_SAISR Receive Even-Data Register Full. When set, REDF indicates that the received data in the receive data registers of the enabled receivers have arrived during an even time slot when operating in the network mode. Even time slots are all even-numbered slots (0, 2, 4, 6, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. REDF is set when the contents of the receive shift registers are transferred to the receive data registers. REDF is cleared when the Core reads all the enabled receive data registers or

*Table continues on the next page...*

**ESAI\_SAISR field descriptions (continued)**

Field	Description
	cleared by hardware, software, ESAI individual resets. If REDIE is set, an ESAI receive even slot data interrupt request is issued when REDF is set.
8 RDF	ESAI_SAISR Receive Data Register Full. RDF is set when the contents of the receive shift register of an enabled receiver is transferred to the respective receive data register. RDF is cleared when the Core reads the receive data register of all enabled receivers or cleared by hardware, software, ESAI individual reset. If RIE is set, an ESAI receive data interrupt request is issued when RDF is set.
7 ROE	ESAI_SAISR Receive Overrun Error Flag. The ROE flag is set when the serial receive shift register of an enabled receiver is full and ready to transfer to its receiver data register (RXn) and the register is already full (RDF=1). If REIE is set, an ESAI receive data with exception (overrun error) interrupt request is issued when ROE is set. Hardware, software, ESAI individual reset clear ROE. ROE is also cleared by reading the SAISR with ROE set, followed by reading all the enabled receive data registers.
6 RFS	ESAI_SAISR Receive Frame Sync Flag. When set, RFS indicates that a receive frame sync occurred during reception of the words in the receiver data registers. This indicates that the data words are from the first slot in the frame. When RFS is clear and a word is received, it indicates (only in the network mode) that the frame sync did not occur during reception of that word. RFS is cleared by hardware, software, ESAI individual reset. RFS is valid only if at least one of the receivers is enabled (REx=1). (In normal mode, RFS always reads as a one when reading data because there is only one time slot per frame - the "frame sync" time slot)
5–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 IF2	ESAI_SAISR Serial Input Flag 2. The IF2 bit is enabled only when the HCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RHCKD=0, indicating that HCKR is an input flag and the synchronous mode is selected. Data present on the HCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF2 bit is updated with this data when the receive shift registers are transferred into the receiver data registers. IF2 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF2.
1 IF1	ESAI_SAISR Serial Inout Flag 1. The IF1 bit is enabled only when the FSR pin is defined as ESAI in the Port Control Register, SYN =1, RFSD=0 and TEBE=0, indicating that FSR is an input flag and the synchronous mode is selected. Data present on the FSR pin is latched during reception of the first received data bit after frame sync is detected. The IF1 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF1 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF1.
0 IF0	ESAI_SAISR Serial Input Flag 0. The IF0 bit is enabled only when the SCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RCKD=0, indicating that SCKR is an input flag and the synchronous mode is selected. Data present on the SCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF0 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF0 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF0.

**25.6.13 Serial Audio Interface Control Register (ESAI\_SAICR)**

The read/write Common Control Register (ESAI\_SAICR) contains control bits for functions that affect both the receive and transmit sections of the ESAI.

## ESAI\_SAICR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 ALC	ESAI_SAICR Alignment Control. The ESAI is designed for 24-bit fractional data, thus shorter data words are left aligned to the MSB (bit 23). Some applications use 16-bit fractional data. In those cases, shorter data words may be left aligned to bit 15. The Alignment Control (ALC) bit supports these applications.  If ALC is set, transmitted and received words are left aligned to bit 15 in the transmit and receive shift registers. If ALC is cleared, transmitted and received word are left aligned to bit 23 in the transmit and receive shift registers.  While ALC is set, 20-bit and 24-bit words may not be used, and word length control should specify 8-, 12-, or 16-bit words; otherwise, results are unpredictable.
7 TEBE	ESAI_SAICR Transmit External Buffer Enable. The Transmitter External Buffer Enable (TEBE) bit controls the function of the FSR pin when in the synchronous mode. If the ESAI is configured for operation in the synchronous mode (SYN=1), and TEBE is set while FSR pin is configured as an output (RFSD=1), the FSR pin functions as the transmitter external buffer enable control to enable the use of an external buffers on the transmitter outputs. If TEBE is cleared, the FSR pin functions as the serial I/O flag 1. See <a href="#">Port C Control Register</a> for a summary of the effects of TEBE on the FSR pin.
6 SYN	ESAI_SAICR Synchronous Mode Selection. The Synchronous Mode Selection (SYN) bit controls whether the receiver and transmitter sections of the ESAI operate synchronously or asynchronously with respect to each other (see <a href="#">Port C Control Register</a> ). When SYN is cleared, the asynchronous mode is chosen and independent clock and frame sync signals are used for the transmit and receive sections. When SYN is set, the synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals.  When in the synchronous mode (SYN=1), the transmit and receive sections use the transmitter section clock generator as the source of the clock and frame sync for both sections. Also, the receiver clock pins SCKR, FSR and HCKR now operate as I/O flags. Refer to <a href="#">Table 25-10</a> , <a href="#">Table 25-11</a> , and <a href="#">Table 25-12</a> for the effects of SYN on the receiver clock pins.
5–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 OF2	ESAI_SAICR Serial Output Flag 2. The Serial Output Flag 2 (OF2) is a data bit used to hold data to be send to the OF2 pin. When the ESAI is in the synchronous clock mode (SYN=1), the HCKR pin is configured as the ESAI flag 2. If the receiver high frequency clock direction bit (RHCKD) is set, the HCKR pin is the output flag OF2, and data present in the OF2 bit is written to the OF2 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.
1 OF1	ESAI_SAICR Serial Output Flag 1. The Serial Output Flag 1 (OF1) is a data bit used to hold data to be send to the OF1 pin. When the ESAI is in the synchronous clock mode (SYN=1), the FSR pin is configured as the ESAI flag 1. If the receiver frame sync direction bit (RFSD) is set and the TEBE bit is cleared, the FSR pin is the output flag OF1, and data present in the OF1 bit is written to the OF1 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.

Table continues on the next page...

**ESAI\_SAICR field descriptions (continued)**

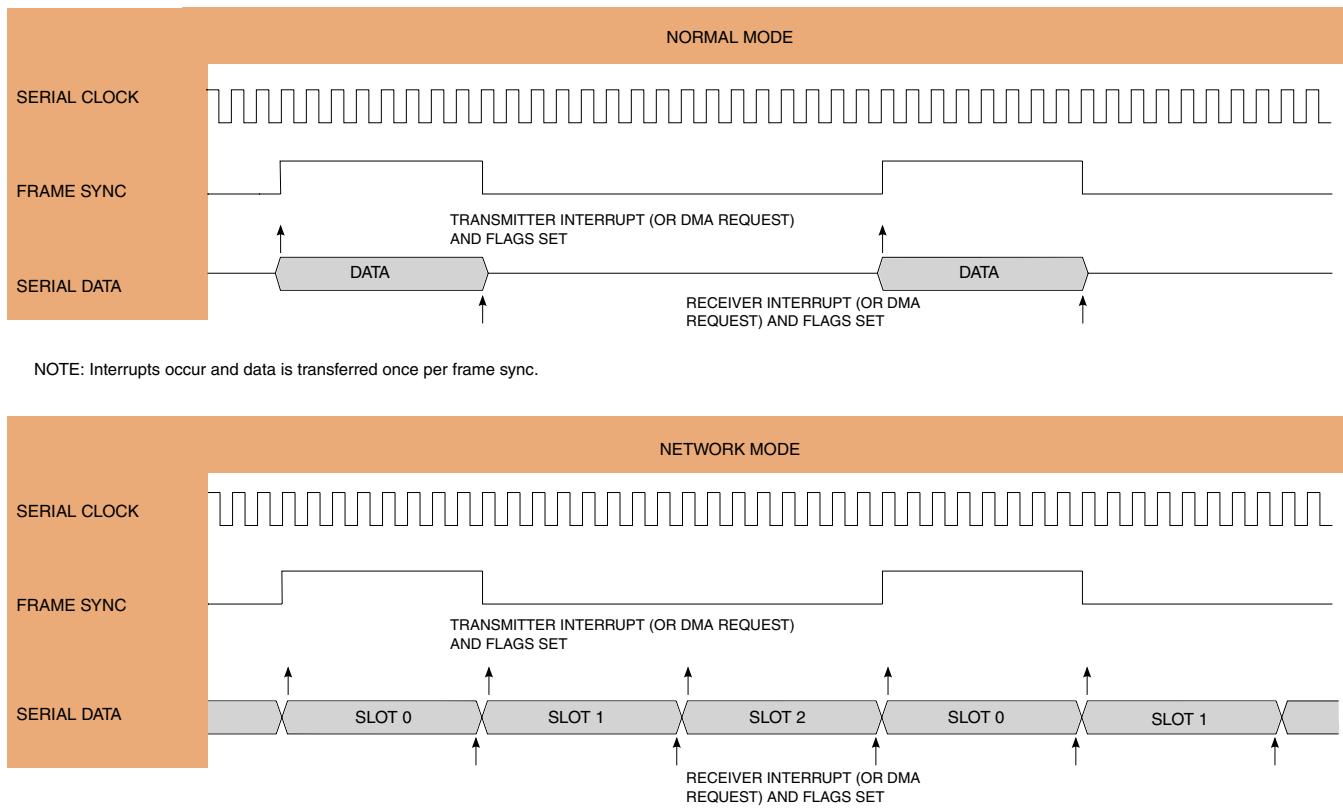

Field	Description
0 OF0	ESAI_SAICR Serial Output Flag 0. The Serial Output Flag 0 (OF0) is a data bit used to hold data to be send to the OF0 pin. When the ESAI is in the synchronous clock mode (SYN=1), the SCKR pin is configured as the ESAI flag 0. If the receiver serial clock direction bit (RCKD) is set, the SCKR pin is the output flag OF0, and data present in the OF0 bit is written to the OF0 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.

**25.6.14 Transmit Control Register (ESAI\_TCR)**

The read/write Transmit Control Register (ESAI\_TCR) controls the ESAI transmitter section. Interrupt enable bits for the transmitter section are provided in this control register. Operating modes are also selected in this register.

### ESAI\_TCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 TLIE	ESAI_TCR Transmit Last Slot Interrupt Enable. TLIE enables an interrupt at the beginning of last slot of a frame in network mode. When TLIE is set the Core is interrupted at the start of the last slot in a frame in network mode regardless of the transmit mask register setting. When TLIE is cleared the transmit last slot interrupt is disabled. TLIE is disabled when TDC=0x00000 (on-demand mode). The use of the transmit last slot interrupt is described in <a href="#">ESAI Interrupt Requests</a> .
22 TIE	ESAI_TCR Transmit Interrupt Enable. The Core is interrupted when TIE and the TDE flag in the ESAI_SAISR status register are set. When TIE is cleared, this interrupt is disabled. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears TDE, thus clearing the interrupt.  Transmit interrupts with exception have higher priority than normal transmit data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller.
21 TEDIE	ESAI_TCR Transmit Even Slot Data Interrupt Enable. The TEDIE control bit is used to enable the transmit even slot data interrupts. If TEDIE is set, the transmit even slot data interrupts are enabled. If TEDIE is cleared, the transmit even slot data interrupts are disabled. A transmit even slot data interrupt request is generated if TEDIE is set and the TEDE status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot in the frame is marked by the frame sync signal and is considered to be even. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears the TEDE flag, thus servicing the interrupt.  Transmit interrupts with exception have higher priority than transmit even slot data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller.
20 TEIE	ESAI_TCR Transmit Exception Interrupt Enable. When TEIE is set, the Core is interrupted when both TDE and TUE in the ESAI_SAISR status register are set. When TEIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by writing to all the data registers of the enabled transmitters clears TUE, thus clearing the pending interrupt.
19 TPR	ESAI_TCR Transmit Section Personal Reset. The TPR control bit is used to put the transmitter section of the ESAI in the personal reset state. The receiver section is not affected. When TPR is cleared, the transmitter section may operate normally. When TPR is set, the transmitter section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The transmitter data pins are tri-stated while in the personal reset state; if a stable logic level is desired, the transmitter data pins should be defined as GPIO outputs, or external pull-up or pull-down resistors should be used. The

Table continues on the next page...

## ESAI\_TCR field descriptions (continued)

Field	Description
	transmitter clock outputs drive zeroes while in the personal reset state. Note that to leave the personal reset state by clearing TPR, the procedure described in <a href="#">ESAI Initialization Examples</a> should be followed.
18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 PADC	ESAI_TCR Transmit Zero Padding Control. When PADC is cleared, zero padding is disabled. When PADC is set, zero padding is enabled. PADC, in conjunction with the TCR[TWA] control bit, determines the way that padding is done for operating modes where the word length is less than the slot length. See the TCR[TWA] bit description in bit 7 for more details.  Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule:  If the data word is left-aligned (TCR[TWA]=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted.  If the data word is right-aligned (TCR[TWA]=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word.
16 TFSR	ESAI_TCR Transmit Frame Sync Relative Timing. TFSR determines the relative timing of the transmit frame sync signal as referred to the serial data lines, for a word length frame sync only (TFSL=0). When TFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When TFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word.
15 TFSL	ESAI_TCR Transmit Frame Sync Length. The TFSL bit selects the length of frame sync to be generated or recognized. If TFSL is cleared, a word-length frame sync is selected. If TFSL is set, a 1-bit clock period frame sync is selected. See Figure 1-21 for examples of frame length selection.
14–10 TSWS	ESAI_TCR Tx Slot and Word Length Select (TSWS4-TSWS0). The TSWS4-TSWS0 bits are used to select the length of the slot and the length of the data words being transferred through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in <a href="#">Table 25-5</a> . See also the ESAI data path programming model in <a href="#">Figure 25-2</a> and <a href="#">Figure 25-3</a> .
9–8 TMOD	ESAI_TCR Transmit Network Mode Control (TMOD1-TMOD0). The TMOD1 and TMOD0 bits are used to define the network mode of ESAI transmitters, as shown in <a href="#">Table 25-5</a> . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in <a href="#">Figure 25-5</a> . In network mode, it is possible to transfer a word for every time slot, as shown in <a href="#">Figure 25-5</a> . For further details, refer to <a href="#">Modes of Operation</a>  In order to comply with AC-97 specifications, TSWS4-TSWS0 should be set to 00011 (20-bit slot, 20-bit word length), TFSL and TFSR should be cleared, and TDC4-TDC0 should be set to 0x0C (13 words in frame). If TMOD=0b11 and the above recommendations are followed, the first slot and word will be 16 bits long, and the next 12 slots and words will be 20 bits long, as required by the AC97 protocol.
7 TWA	ESAI_TCR Transmit Word Alignment Control. The Transmitter Word Alignment Control (TCR[TWA]) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If TCR[TWA] is cleared, the data word is left-aligned in the slot frame during transmission. If TCR[TWA] is set, the data word is right-aligned in the slot frame during transmission.  Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule:  If the data word is left-aligned (TCR[TWA]=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted.

*Table continues on the next page...*

**ESAI\_TCR field descriptions (continued)**

Field	Description
	If the data word is right-aligned (TCR[TWA]=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word.
6 TSHFD	ESAI_TCR Transmit Shift Direction. The TSHFD bit causes the transmit shift registers to shift data out MSB first when TSHFD equals zero or LSB first when TSHFD equals one (see <a href="#">Figure 25-2</a> and <a href="#">Figure 25-3</a> ).
5 TE5	<p>ESAI_TCR ESAI Transmit 5 Enable. TE5 enables the transfer of data from ESAI_TX5 to the transmit shift register #5. When TE5 is set and a frame sync is detected, the transmit #5 portion of the ESAI is enabled for that frame. When TE5 is cleared, the transmitter #5 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX5 when TE5 is cleared but the data is not transferred to the transmit shift register #5.</p> <p>The SDO5/SDI0 pin is the data input pin for ESAI_RX0 if TE5 is cleared and RE0 in the ESAI_RCR register is set. If both RE0 and TE5 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE0 and TE5 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE5 and setting it again disables the transmitter #5 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO5/SDI0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE5 can be left enabled.</p>
4 TE4	<p>ESAI_TCR ESAI Transmit 4 Enable. TE4 enables the transfer of data from ESAI_TX4 to the transmit shift register #4. When TE4 is set and a frame sync is detected, the transmit #4 portion of the ESAI is enabled for that frame. When TE4 is cleared, the transmitter #4 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX4 when TE4 is cleared but the data is not transferred to the transmit shift register #4.</p> <p>The SDO4/SDI1 pin is the data input pin for ESAI_RX1 if TE4 is cleared and RE1 in the RCR register is set. If both RE1 and TE4 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE1 and TE4 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE4 and setting it again disables the transmitter #4 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO4/SDI1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE4 can be left enabled.</p>
3 TE3	<p>ESAI_TCR ESAI Transmit 3 Enable. TE3 enables the transfer of data from ESAI_TX3 to the transmit shift register #3. When TE3 is set and a frame sync is detected, the transmit #3 portion of the ESAI is enabled for that frame. When TE3 is cleared, the transmitter #3 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX3 when TE3 is cleared but the data is not transferred to the transmit shift register #3.</p> <p>The SDO3/SDI2 pin is the data input pin for ESAI_RX2 if TE3 is cleared and RE2 in the ESAI_RCR register is set. If both RE2 and TE3 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE2 and TE3 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE3 and setting it again disables the transmitter #3 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO3/SDI2 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE3 can be left enabled.</p>

Table continues on the next page...

**ESAI\_TCR field descriptions (continued)**

Field	Description
2 TE2	<p>ESAI_TCR ESAI Transmit 2 Enable. TE2 enables the transfer of data from ESAI_TX2 to the transmit shift register #2. When TE2 is set and a frame sync is detected, the transmit #2 portion of the ESAI is enabled for that frame. When TE2 is cleared, the transmitter #2 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX2 when TE2 is cleared but the data is not transferred to the transmit shift register #2.</p> <p>The SDO2/SDI3 pin is the data input pin for ESAI_RX3 if TE2 is cleared and RE3 in the ESAI_RCR register is set. If both RE3 and TE2 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE3 and TE2 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE2 and setting it again disables the transmitter #2 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO2/SDI3 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE2 can be left enabled.</p>
1 TE1	<p>ESAI_TCR ESAI Transmit 1 Enable. TE1 enables the transfer of data from TX1 to the transmit shift register #1. When TE1 is set and a frame sync is detected, the transmit #1 portion of the ESAI is enabled for that frame. When TE1 is cleared, the transmitter #1 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO1 output is tri-stated, and any data present in TX1 is not transmitted, that is, data can be written to TX1 with TE1 cleared, but data is not transferred to the transmit shift register #1.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE1 and setting it again disables the transmitter #1 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE1 can be left enabled.</p>
0 TE0	<p>ESAI_TCR ESAI Transmit 0 Enable. TE0 enables the transfer of data from ESAI_TX0 to the transmit shift register #0. When TE0 is set and a frame sync is detected, the transmit #0 portion of the ESAI is enabled for that frame. When TE0 is cleared, the transmitter #0 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO0 output is tri-stated, and any data present in ESAI_TX0 is not transmitted, that is, data can be written to ESAI_TX0 with TE0 cleared, but data is not transferred to the transmit shift register #0.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE0 and setting it again disables the transmitter #0 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE0 can be left enabled.</p>

## 25.6.15 Transmit Clock Control Register (ESAI\_TCCR)

The read/write Transmitter Clock Control Register (ESAI\_TCCR) controls the ESAI transmitter clock generator bit and frame sync rates, the bit clock and high frequency clock sources and the directions of the HCKT, FST and SCKT signals. In the synchronous mode (SYN=1), the bit clock defined for the transmitter determines the receiver bit clock as well. ESAI\_TCCR also controls the number of words per frame for the serial data. Hardware and software reset clear all the bits of the ESAI\_TCCR register.

Care should be taken in asynchronous mode whenever the frame sync clock (FSR, FST) is not sourced directly from its associated bit clock (SCKR, SCKT). Proper phase relationships must be maintained between these clocks in order to guarantee proper operation of the ESAI.

### NOTE

ARM Core clock is ipg\_clk\_esai in block ESAI which is from CCM's ahb\_clk\_root.

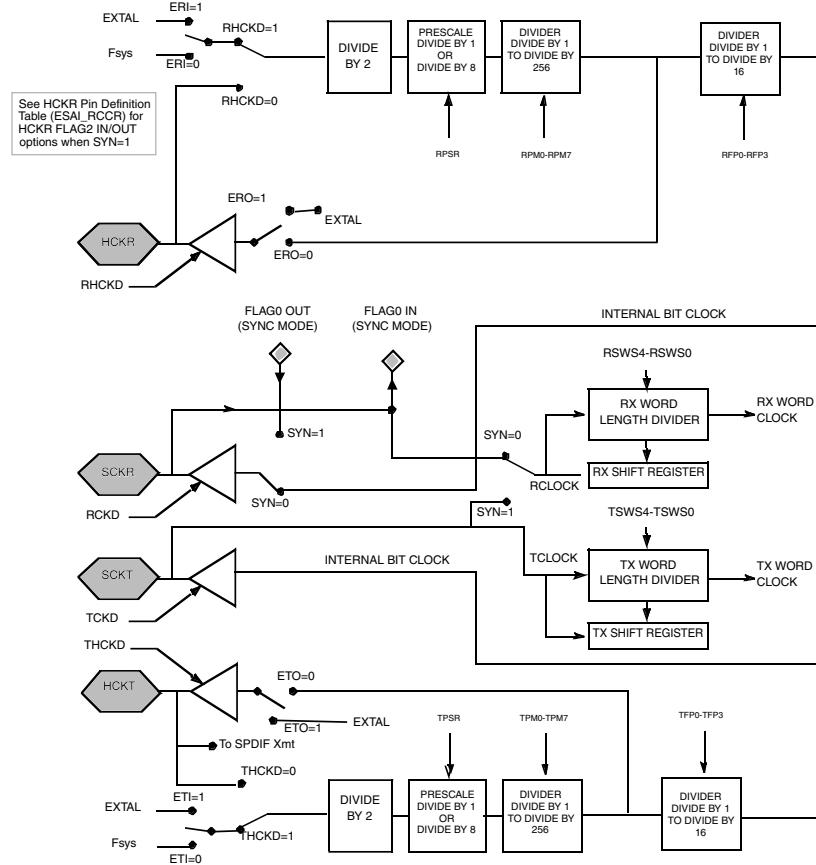

Figure 25-7. ESAI Clock Generator Functional Block Diagram

**NOTE**

1. ETI, ETO, ERI and ERO bit descriptions are covered in [ESAI Control Register \(ESAI\\_ECR\)](#).
2. Fsys is the ESAI system 133 MHz clock.
3. EXTAL is the on-chip clock sources other than ESAI system 133MHz clock.

### ESAI\_TCCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 THCKD	ESAI_TCCR Transmit High Frequency Clock Direction. THCKD controls the direction of the HCKT pin. When THCKD is cleared, HCKT is an input; when THCKD is set, HCKT is an output (see <a href="#">Table 25-2</a> ).
22 TFSD	ESAI_TCCR Transmit Frame Sync Signal Direction. TFSD controls the direction of the FST pin. When TFSD is cleared, FST is an input; when TFSD is set, FST is an output (see <a href="#">Table 25-2</a> ).
21 TCKD	ESAI_TCCR Transmit Clock Source Direction. The Transmitter Clock Source Direction (TCKD) bit selects the source of the clock signal used to clock the transmit shift registers in the asynchronous mode (SYN=0) and the transmit shift registers and the receive shift registers in the synchronous mode (SYN=1). When TCKD is set, the internal clock source becomes the bit clock for the transmit shift registers and word length divider and is the output on the SCKT pin. When TCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKT pin, and an external clock source may drive this pin (see <a href="#">Table 25-2</a> ).
20 THCKP	ESAI_TCCR Transmit High Frequency Clock Polarity The Transmitter High Frequency Clock Polarity (THCKP) bit controls the polarity of the HCKT. 0 - Normal polarity 1 - Inverted polarity
19 TFSP	ESAI_TCCR Transmit Frame Sync Polarity. The Transmitter Frame Sync Polarity (TFSP) bit determines the polarity of the transmit frame sync signal. When TFSP is cleared, the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When TFSP is set, the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin.
18 TCKP	ESAI_TCCR Transmit Clock Polarity. The Transmitter Clock Polarity (TCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If TCKP is cleared the data and the frame sync are clocked out on the rising edge of the transmit bit clock and latched in on the falling edge of the transmit bit clock. If TCKP is set the falling edge of the transmit clock is used to clock the data out and frame sync and the rising edge of the transmit clock is used to latch the data and frame sync in.
17–14 TFP	ESAI_TCCR Tx High Frequency Clock Divider. The TFP3-TFP0 bits control the divide ratio of the transmitter high frequency clock to the transmitter serial bit clock when the source of the high frequency clock and the bit clock is the internal ARM Core clock. When the HCKT input is being driven from an external high frequency clock, the TFP3-TFP0 bits specify an additional division ratio in the clock divider chain. <a href="#">Table 25-6</a> shows the specification for the divide ratio. <a href="#">Figure 25-7</a> shows the ESAI high frequency clock generator functional diagram.

Table continues on the next page...

**ESAI\_TCCR field descriptions (continued)**

Field	Description
13–9 TDC	<p>ESAI_TCCR Tx Frame Rate Divider Control. The TDC4-TDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the transmitter frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (TDC=0x00001 to 0x11111) for network mode. A divide ratio of one (TDC=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (TDC=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of 1 (TDC=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (TFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in <a href="#">Figure 25-8</a></p>
8 TPSR	<p>ESAI_TCCR Transmit Prescaler Range. The TPSR bit controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When TPSR is set, the fixed prescaler is bypassed. When TPSR is cleared, the fixed divide-by-eight prescaler is operational (see <a href="#">Figure 25-7</a>). The maximum internally generated bit clock frequency is Fsys/6; the minimum internally generated bit clock frequency is Fsys/(2 x 8 x 256 x 16)=Fsys/65536.</p> <p><b>NOTE:</b> Do not use the combination TPSR = 1 and TPM7-RPM0 = 0x00, which causes synchronization problems when using the internal core clock as source (THCKD = 1 or TCKD = 1).</p>
TPM	<p>ESAI_TCCR Transmit Prescale Modulus Select. The TPM7-TPM0 bits specify the divide ratio of the prescale divider in the ESAI transmitter clock generator. A divide ratio from 1 to 256 (TPM=0x00 to 0xFF) may be selected. The bit clock output is available at the transmit serial bit clock (SCKT) pin. The bit clock output is also available internally for use as the bit clock to shift the transmit and receive shift registers.</p> <p>The ESAI transmit clock generator functional diagram is shown in <a href="#">Figure 25-7</a>.</p>

**25.6.16 Receive Control Register (ESAI\_RCR)**

The read/write Receive Control Register (ESAI\_RCR) controls the ESAI receiver section. Interrupt enable bits for the receivers are provided in this control register. The receivers are enabled in this register (0,1,2 or 3 receivers can be enabled) if the input data pin is not used by a transmitter. Operating modes are also selected in this register.

**Table 25-7. ESAI Receive Network Mode Selection**

**ESAI\_RCR field descriptions**

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RLIE	ESAI_RCR Receive Last Slot Interrupt Enable. RLIE enables an interrupt after the last slot of a frame ended in network mode only. When RLIE is set the Core is interrupted after the last slot in a frame ended regardless of the receive mask register setting. When RLIE is cleared the receive last slot interrupt is disabled. Hardware and software reset clear RLIE. RLIE is disabled when RDC=00000 (on-demand mode). The use of the receive last slot interrupt is described in <a href="#">ESAI Interrupt Requests</a> .
22 RIE	ESAI_RCR Receive Interrupt Enable. The Core is interrupted when RIE and the RDF flag in the ESAI_SAISR status register are set. When RIE is cleared, this interrupt is disabled. Reading the receive data registers of the enabled receivers clears RDF, thus clearing the interrupt.  Receive interrupts with exception have higher priority than normal receive data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller.
21 REDIE	ESAI_RCR Receive Even Slot Data Interrupt Enable. The REDIE control bit is used to enable the receive even slot data interrupts. If REDIE is set, the receive even slot data interrupts are enabled. If REDIE is cleared, the receive even slot data interrupts are disabled. A receive even slot data interrupt request is generated if REDIE is set and the REDF status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot is marked by the frame sync signal and is considered to be even. Reading all the data registers of the enabled receivers clears the REDF flag, thus servicing the interrupt.  Receive interrupts with exception have higher priority than receive even slot data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller.
20 REIE	ESAI_RCR Receive Exception Interrupt Enable. When REIE is set, the Core is interrupted when both RDF and ROE in the ESAI_SAISR status register are set. When REIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by reading the enabled receivers data registers clears ROE, thus clearing the pending interrupt.
19 RPR	ESAI_RCR Receiver Section Personal Reset. The RPR control bit is used to put the receiver section of the ESAI in the personal reset state. The transmitter section is not affected. When RPR is cleared, the receiver section may operate normally. When RPR is set, the receiver section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The receiver data pins are disconnected while in the personal reset state.

*Table continues on the next page...*

## ESAI\_RCR field descriptions (continued)

Field	Description
	<b>NOTE:</b> To leave the personal reset state by clearing RPR, the procedure described in <a href="#">ESAI Initialization Examples</a> should be followed.
18–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 RFSR	ESAI_RCR Receiver Frame Sync Relative Timing. RFSR determines the relative timing of the receive frame sync signal as referred to the serial data lines, for a word length frame sync only. When RFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When RFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word.
15 RFSL	ESAI_RCR Receiver Frame Sync Length. The RFSL bit selects the length of the receive frame sync to be generated or recognized. If RFSL is cleared, a word-length frame sync is selected. If RFSL is set, a 1-bit clock period frame sync is selected. Refer to <a href="#">Figure 25-6</a> for examples of frame length selection.
14–10 RSWS	ESAI_RCR Receiver Slot and Word Select. The RSWS4-RSWS0 bits are used to select the length of the slot and the length of the data words being received through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in <a href="#">Table 25-8</a> . See also the ESAI data path programming model in <a href="#">Figure 25-2</a> and <a href="#">Figure 25-3</a> .
9–8 RMOD	ESAI_RCR Receiver Network Mode Control. The RMOD1 and RMOD0 bits are used to define the network mode of the ESAI receivers, as shown in <a href="#">Table 25-7</a> . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in <a href="#">Figure 25-5</a> . In network mode, it is possible to transfer a word for every time slot, as shown in <a href="#">Figure 25-5</a> . For more details, see <a href="#">Modes of Operation</a> .  In order to comply with AC-97 specifications, RSWS4-RSWS0 should be set to 0x00011 (20-bit slot, 20-bit word); RFSL and RFSR should be cleared, and RDC4-RDC0 should be set to 0x0C (13 words in frame).
7 RWA	ESAI_RCR Receiver Word Alignment Control. The Receiver Word Alignment Control (RWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If RWA is cleared, the data word is assumed to be left-aligned in the slot frame. If RWA is set, the data word is assumed to be right-aligned in the slot frame.  If the data word is shorter than the slot length, the data bits which are not in the data word field are ignored.  For data word lengths of less than 24 bits, the data word is right-extended with zeroes before being stored in the receive data registers.
6 RSHFD	ESAI_RCR Receiver Shift Direction. The RSHFD bit causes the receiver shift registers to shift data in MSB first when RSHFD is cleared or LSB first when RSHFD is set (see <a href="#">Figure 25-2</a> and <a href="#">Figure 25-3</a> ).
5–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 RE3	ESAI_RCR ESAI Receiver 3 Enable. When RE3 is set and TE2 is cleared, the ESAI receiver 3 is enabled and samples data at the SDO2/SDI3 pin. ESAI_TX2 and ESAI_RX3 should not be enabled at the same time (RE3=1 and TE2=1). When RE3 is cleared, receiver 3 is disabled by inhibiting data transfer into ESAI_RX3. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX3 data register.  If RE3 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX3 will be invalid and must be discarded.
2 RE2	ESAI_RCR ESAI Receiver 2 Enable. When RE2 is set and TE3 is cleared, the ESAI receiver 2 is enabled and samples data at the SDO3/SDI2 pin. ESAI_TX3 and ESAI_RX2 should not be enabled at the same time (RE2=1 and TE3=1). When RE2 is cleared, receiver 2 is disabled by inhibiting data transfer into ESAI_RX2. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX2 data register.  If RE2 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX2 will be invalid and must be discarded.

Table continues on the next page...

**ESAI\_RCR field descriptions (continued)**

Field	Description
1 RE1	ESAI_RCR ESAI Receiver 1 Enable. When RE1 is set and TE4 is cleared, the ESAI receiver 1 is enabled and samples data at the SDO4/SDI1 pin. ESAI_TX4 and ESAI_RX1 should not be enabled at the same time (RE1=1 and TE4=1). When RE1 is cleared, receiver 1 is disabled by inhibiting data transfer into ESAI_RX1. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX1 data register.  If RE1 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX1 will be invalid and must be discarded.
0 RE0	ESAI_RCR ESAI Receiver 0 Enable. When RE0 is set and TE5 is cleared, the ESAI receiver 0 is enabled and samples data at the SDO5/SDI0 pin. ESAI_TX5 and ESAI_RX0 should not be enabled at the same time (RE0=1 and TE5=1). When RE0 is cleared, receiver 0 is disabled by inhibiting data transfer into ESAI_RX0. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX0 data register.  If RE0 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX0 will be invalid and must be discarded.

**25.6.17 Receive Clock Control Register (ESAI\_RCCR)**

The read/write Receiver Clock Control Register (ESAI\_RCCR) controls the ESAI receiver clock generator bit and frame sync rates, word length, and number of words per frame for the serial data. The ESAI\_RCCR control bits are described in the following paragraphs.

**NOTE**

ARM Core clock is ipg\_clk\_esai in block ESAI which is from CCM's ahb\_clk\_root.

**ESAI\_RCCR field descriptions**

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RHCKD	ESAI_RCCR Receiver High Frequency Clock Direction. The Receiver High Frequency Clock Direction (RHCKD) bit selects the source of the receiver high frequency clock when in the asynchronous mode (SYN=0) and the IF2/OF2 flag direction in the synchronous mode (SYN=1).  In the asynchronous mode, when RHCKD is set, the internal clock generator becomes the source of the receiver high frequency clock and is the output on the HCKR pin. In the asynchronous mode, when RHCKD is cleared, the receiver high frequency clock source is external; the internal clock generator is disconnected from the HCKR pin, and an external clock source may drive this pin.  When RHCKD is cleared, HCKR is an input; when RHCKD is set, HCKR is an output.  In the synchronous mode when RHCKD is set, the HCKR pin becomes the OF2 output flag. If RHCKD is cleared, the HCKR pin becomes the IF2 input flag. Refer to <a href="#">Table 25-1</a> and <a href="#">Table 25-12</a> .
22 RFSD	ESAI_RCCR Receiver Frame Sync Signal Direction. The Receiver Frame Sync Signal Direction (RFSD) bit selects the source of the receiver frame sync signal when in the asynchronous mode (SYN=0) and the IF1/OF1/Transmitter Buffer Enable flag direction in the synchronous mode (SYN=1).  In the asynchronous mode, when RFSD is set, the internal clock generator becomes the source of the receiver frame sync and is the output on the FSR pin. In the asynchronous mode, when RFSD is cleared, the receiver frame sync source is external; the internal clock generator is disconnected from the FSR pin, and an external clock source may drive this pin.  In the synchronous mode when RFSD is set, the FSR pin becomes the OF1 output flag or the Transmitter Buffer Enable, according to the TEBE control bit. If RFSD is cleared, the FSR pin becomes the IF1 input flag. Refer to <a href="#">Table 25-1</a> and <a href="#">Table 25-11</a> .
